SOCINUS, the Latinized form of the Italian Soccini, Sozini, or Sozzini

I LELIO FRANCESCO MARIA SOZINI (1525-1562), theological inquirer, was born at Siena on 29th January 1525 His family descended from Sozzo, a banker at Percena, whose second son, Mino Sozzi, settled as a notary at Siena in 1304 Mino Sozzi's grandson, Sozzino (d 1403), was the ancestor of a line of patrician jurists, of whom Mariano Sozzini, senior (1397-1467), was the first and the most famous Lelio was the sixth son of Mariano Sozzini, junior (1482-1556), by his wife Camilla Salvetti The family name is variously spelled (usually "Soccini" by modern writers), Lelio invariably uses the form "Sozini," Latinizing it "Sozinus", his nephew FAUSTO (see below) writes "Sozzini" and "Socinus" Sozini was educated as a jurist under his father's eye at Bologna According to Melanchthon, it was his desire to reach the *fontes juris* which led him to Biblical studies and hence to the rejection of "the idolatry of Rome" Later on he acquired some knowledge of Hebrew and Arabic (he gave to Bibliander a manuscript of the Koran) as well as Greek, but he was never a laborious student His father supplied him with means, and on coming of age he went to Venice, the headquarters of the evangelical movement in Italy A tradition first published by Sand in 1678, and amplified by subsequent writers, makes Sozini the leading spirit in certain alleged theological conferences at Vicenza, about 1546, which are said to have forecast the main positions of the Unitarian heresy, but the whole account, including the story of the flight of Sozini, must be rejected as mythical At this period the standpoint of Sozini was that of evangelical Protestantism, his mental temper presents a singular union of enthusiastic piety with a love for the subtleties of theological speculation It was at Chiavenna in 1547 that he came under the influence of a gentle mystic, Camillo of Sicily, surnamed "Renato," whose teaching anticipated at many points that of the early Quakers Pursuing his religious travels, Sozini visited Switzerland, France, England, and Holland, returning to Switzerland at the close of 1548 He had commendatory letters to the Swiss churches from Nicolas Meyer, envoy from Wittenberg to Italy, but his family name was a sufficient passport, and wherever he went his personal charm won friends. We find him in 1549-50 at Geneva and Basel (with Sebastian Munster), but chiefly at Zurich, where he lodges with Pellican He spends eleven months (July 1550 to June 1551) at Wittenberg, at first under Melanchthon's roof, then with Johann Forster for the improvement of his Hebrew From Wittenberg Sozini returned to Zurich (end of 1551) after visiting Prague, Vienna, and Cracow Political events attracted him back to Italy in June 1552 Two visits to Siena (where freedom of speech was for the moment possible, owing to the shaking off of the Spanish yoke) brought him into fruitful contact with his young nephew Fausto. He was at Padua (not at Geneva, as is often said) at the date of Servetus's execution (27th October 1553) Thence he made his way to Basel (January 1554), Geneva (April), and Zurich (May), where he took up his abode

Calvin, as well as Melanchthon, received Sozini with open arms Melanchthon (though a phrase in one of his letters has been strangely misinterpreted) never regarded him with theological suspicion To Calvin's keen glance Sozini's over-speculative tendency and the genuineness of his religious nature were equally apparent. A passage often quoted from one of Calvin's letters to Sozini (1st January 1552) has been construed as a breaking off of amicable intercourse, but, while more than once uneasy apprehensions arose in Calvin's mind, there was no breach of correspondence or of friendship Of all the Reformers Bullinger was Sozini's closest intimate, his warmest and wisest friend Sozini's theological difficulties turned upon the resurrection of the body, predestination, the ground of salvation (these were the points on which he corresponded with Calvin), the doctrinal basis of the original gospel (queries addressed to Bullinger), the nature of repentance

(to Rudolph Gualther), the sacraments (to Johann Wolff). Not till the fate of Servetus had directed his mind to the question of the Trinity did he throw out any doubts upon this subject. At Geneva, in April 1554, he had uttered incautious remarks on the common doctrine, emphasized in a subsequent letter to Martinengo, the Italian pastor. Bullinger, warned by several correspondents (including Calvin), questioned Sozini as to his faith, and received from him an explicitly orthodox confession, afterwards reduced to writing (15th July 1555), with a frank reservation of the right of further inquiry. A month before this Sozini had been sent with Martino Muralto to Basel to secure Ochino as pastor of the Italian church at Zurich. There can be little doubt that the minds of Sozini and Ochino (a thinker of the same order as Camillo, but with finer dialectic skill) acted powerfully on each other in the radical discussion of theological problems. Sozini lost his father in 1556, an event which involved him in pecuniary anxieties. To what property he was entitled does not appear; he got nothing under his father's will. Fortified with the most influential introductions (including one from Calvin), he visited in 1558 the courts of Vienna and Cracow to obtain support for his appeal to the reigning duke of Florence. His object was to realize his own estate and secure that of his family. It is a sufficiently curious circumstance that Melanchthon's letter introducing Sozini to Maximilian II invokes the historic parallel of the emperor Constans rendering a hospitable reception to Athanasius, when he fled from Egypt to Treves. Well received out of Italy, Sozini (who does not appear to have got beyond Venice) found he could do nothing at home. The Inquisition had its eye on his family; his brother Cornelio was imprisoned at Rome; his brothers Celso and Camillo and his nephew Fausto were "reputati Luterani" at Siena, and Camillo had taken refuge in flight. In August 1559 Sozini returned to Zurich, and we hear little more of him. His brief career ended on 14th May 1562, at his lodging in the house of Hans Wyss, silk-weaver.

The news of his death reached his nephew at Lyons through Antonio Maria Besozzo. Fausto repaired to Zurich and got his uncle's papers, comprising very little connected writing, but a good many notes. Fausto has so often been regarded as a plagiarist from Lelio that it may be well here to state that his debt to Lelio, somewhat over-estimated by himself, was twofold. (1) He derived from him in conversation (1552-53) the germ of his theory of salvation; (2) Lelio's paraphrase (1561) of ἀρχή in John i. 1 as "the beginning of the gospel" gave Fausto a hint of Biblical exegesis by help of which he constructed a new Christology. Apart from these suggestions, Fausto owed nothing to Lelio except a curiously far-fetched interpretation of John viii. 58, and the stimulating remembrance of his pure character and brilliant gifts. The two men were of totally different genius. Lelio, impulsive and inquisitive, was in quest of the spiritual ground of religious truth; the drier mind of Fausto sought in external authority a basis for the ethical teaching of Christianity.

Sozini's extant writings are (1) *De Sacramentis Dissertatio*, four parts, 1560, and (2) *De Resurrectione*, a fragment. Both were first printed in *F. et L. Socini, item E. Soneri Tractatus*, Amsterdam, 1654, 16mo. To these may be added his *Confession*, 1555 (printed in Hottinger, *Hist. Eccles. N. T.*, vol. ix., sec. 16, part 5, 1667), and about twenty-four letters, some still unprinted; but the most important will be found in Illgen and Trechsel, and (the earliest) in the edition of Calvin's works by Baum, Cunitz, and Reuss. Sand adds a *Rhapsodia in Esaiam Prophetam*, of which nothing is known. Beza suspected that Sozini had a hand in the *De Hæreticis, an sint persequendi*, 1553, and to him has also been assigned the *Contra Libellum Calvini*, 1554; but these ascriptions were not made till his nephew had identified his name with active heresy, and are not supported by internal evidence. To Lelio also Beza assigned (in 1567) an anonymous *Explicatio* (1562) of the proem of St John's Gospel, which was the work of Fausto. This error, adopted by Zanchi, has been the chief source of the misconception which represents Lelio as a heresiarch. In Franc. Giunio's *Defensio Cath. Doct. de S. Trin.*, 1590-91, is an anonymous *enumeratio* of motives for adhering to the doctrine of the Trinity, by some ascribed to Lelio, by others, with somewhat more probability, to Fausto.

For the life of L. Sozini the best guide is Trechsel, *Die Prot. Antitrin. vor F. Socin*, vol. ii., 1844; but there are valuable materials in Illgen, *Vita L. Socini*, 1814, and especially *Symbolæ ad Vitam et Doctrinam L. Soc.*, &c., 1826. Wallace (*Antitrin. Biog.*, 1850, ii. 63) gives the ordinary Unitarian view, relying on Bock, Da Porta, and Lubieniecki; see also Bonet-Maury's *Early Sources of English Unit. Christ.*, 1884, chap. 9. Use has been made above of unprinted sources.

II. Fausto Paolo Sozzini (1539-1604), theological writer, was born at Siena on 5th December 1539, the only son of Alessandro Sozzini, "princeps subtilitatum," by Agnese, daughter of Borghese Petrucci. He was thus descended on the one side from the long line of great lawyers, of whom Mariano the elder is traditionally said to have been the first heretic of the family, on the other from Pandolfo Petrucci, the Cromwell of Siena. His father died in 1541 at the early age of thirty-one. Fausto received no regular education; he was brought up at home with his sister Fillide. The influence of the able women of his family communicated a strong moral impress to his thought. His youth was spent in desultory reading at Scopeto, the country seat of his family. His early intellectual stimulus came from his uncle Celso, an *esprit fort*, though always nominally a Catholic, and the founder of the Accademia dei Sizienti (1554), of which Fausto was a member. In 1556 his grandfather's will made him independent by leaving him one-fourth of the family estates. Next year he was enrolled in the famous Accademia degli Intronati, the centre of the intellectual life of Siena. His academic name was "Il Frastagliato"; he took as his badge "un mare turbato da venti," with the motto "turbant sed extollunt." About this time Panzirolo (*De Claris Legg. Interpp.*, not published till 1637) describes him as a young man of fine talent, and bespeaks for him a legal career. But Fausto despised the law, and preferred the writing of sonnets. He was suspected of Lutheranism in 1558-59; soon after he came of age (1561) he went to Lyons, being probably employed there in mercantile business; he revisited Italy after his uncle Lelio's death; we next find him enrolled for a short time in 1562 as a member of the Italian church at Geneva; he returned to Lyons next year. The evangelical position was not radical enough for him. His *Explicatio* (1562) of the proem to St John's Gospel shows that already he attributed to our Lord an official instead of an essential deity; a letter of 1563 rejects the natural immortality of man (a position developed long after in his disputation with Pucci). Towards the end of 1563 he conformed again to the Catholic Church, and spent the next twelve years in Italy, partly at court. Przypkowski, regardless of chronology, places him in the service of Francesco, grand-duke of Tuscany. His unpublished letters show that he was in the service only of Isabella de' Medici, Francesco's sister. This portion of his life is obscure, and he afterwards regarded it as wasted. Till 1567 he continued to give some attention to legal studies. He found time to write (1570) his treatise *De Auctoritate S. Scripturæ*. In 1571 he was in Rome, perhaps with his patroness. At the end of 1575 he left Italy, and after Isabella's death (strangled by her husband in 1576) declined the overtures of Francesco, who pressed him to return. Francesco was probably aware of the motives which led Sozzini to quit Italy; for there is every reason to believe the statement of Przypkowski that the grand-duke agreed to protect him in the enjoyment of the income of his property so long as he published nothing in his own name. Sozzini now fixed himself at Basel, where he gave himself to close study of the Bible, began a poetic version of the Psalms, edited posthumous dialogues of Castellio, and, in spite of his increasing deafness, became a

recognized centre of theological discussion. One of these discussions was on the doctrine of salvation, with Jacques Couet. It resulted in a bulky treatise, *De Jesu Christo Servatore* (finished 12th July 1578), the circulation of which in manuscript appears to have commended his powers to the notice of Giorgio Biandrata (1515-1588), court physician in Transylvania, and an unscrupulous ecclesiastical wire-puller.[1]

Transylvania had for a short time (1559-71) enjoyed religious liberty under an antitrinitarian prince, John Sigismund. But the existing ruler, Christopher Báthori, favoured the Jesuits, and it was an object with Biandrata to limit the "Judaic" tendencies of the antitrinitarian bishop, Francis Dávid (1510-1579), with whom he had previously acted. By the alleged discovery of a stain upon Biandrata's morals of the gravest sort his influence with Dávid was destroyed. Now Sozzini's scheme of doctrine encouraged the use of seemingly orthodox language in an heretical sense. Christ was to be called God, and invoked with divine honours, though without any inherent title to such homage, but as "un Dio subalterno, al quale in un dato tempo il Dio supremo cedette il governo del mondo" (Cantù). It occurred to Biandrata that, if Sozzini could convert the eloquent Dávid to this view, all would be well. Accordingly in November 1578 Sozzini reached Kolozsvár (Klausenburg), and did his best, during a visit of four months and a half under Dávid's roof, to teach him the doctrine of the invocation of Christ. Though Sozzini did not (as Biandrata desired) urge the absolute necessity of this invocation, the result was a public explosion on Dávid's part against the cultus of Christ in any shape or form. His trial followed, on a charge of innovation. Sozzini hurried off to Poland before it began. He cannot be accused of a guilty complicity with what he calls the rage of Biandrata, for he was no party to the incarceration of Dávid at Déva, where the old man miserably perished in prison. But he was willing that Dávid should be prohibited from preaching pending the decision of the controversy by a general synod, and his references to the case show that (as in the later instances of Jacobo Paleologo, Christian Francken, and Martin Seidel) theological aversions, though they never made him uncivil, froze up his kindness and blinded his perceptions of character. Biandrata ultimately conformed to the Catholic Church, yet as late as 1584 Sozzini, always constant to the leanings of friendship, sought his patronage for his treatise *De Jesu Christi Natura*, in reply to the Calvinist Andrew Wolan. The remainder (1579-1604) of Sozzini's life was spent in Poland. Excluded at first by his views on baptism from the Minor or Antitrinitarian Church (anabaptist in its constitution), he acquired by degrees a predominant influence in its synods. He converted the Arians from their avowal of our Saviour's pre-existence and their refusal to honour Him by invocation; he repressed the semi-Judaizers whom he could not convince. Through correspondence with his friends in official places he ruled also the policy of the Antitrinitarian Church of Transylvania. Forced to leave Cracow in 1583, he found a home with a Polish noble, Christopher Morsztyn, whose daughter Elizabeth he married (1586). She died in the following year, a few months after giving birth to a daughter, Agnese, afterwards the wife of Stanislau Wiszowaty. In 1587 the grand-duke Francesco died, and to this event Sozzini's biographers attribute the loss of his Italian property. But he was on good terms with Francesco's successor, and might have continued to receive his rents had not family disputes arisen respecting the interpretation of his grandfather's will. The holy office at Siena disinherited him in October 1590, but he was allowed a pension, which does not seem to have been paid. The failure of supplies from Italy dissolved the compact under which his works were to remain anonymous. He began to publish under his own name. The consequence was that in 1598 a mob expelled him from Cracow, wrecking his house and grossly ill-using his person. Friends gave him a ready welcome at Luslawice, 30 miles east from Cracow, and here, having long been troubled with colic and the stone, he died on 4th March 1604. A limestone block, with illegible inscriptions, marks his grave.[2]

Sozzini's works, as edited by his grandson Andrew Wiszowaty and the learned printer F. Kuyper, are contained in two closely printed folios, Amsterdam, 1668. They are usually reckoned the first two volumes of the *Bibliotheca Fratrum Polonorum*, but in fact the works of Crell and Schlichting preceded them in the series. They include all Sozzini's extant theological writings, except his essay *On Predestination* (in which he denies that God foresees the actions of free agents), prefixed to Castellio's *Dialogi IV*, 1578 (reprinted 1613), and his revision of a school manual, *Instrumentum Doctrinarum Aristotelicum*, 1586. His pseudonyms, easily interpreted, were Felix Turpio Urbevetanus, Prosper Dysidæus, Gratianus Prosper, and Gratianus Turpio Gerapolensis (= Senensis). Some of his early poetry will be found in Ferentilli's *Scelta di Stanze di Diversi Autori Toscani*, 1579 (reprinted 1594); other specimens are given in Cantù, and in the *Athenæum*, 11th August 1877. Sozzini himself considered that his *Contra Atheos*, which perished in the riot at Cracow, was his ablest work. In later life he began, but left incomplete, more than one work intended to exhibit his system as a whole. His reputation as a thinker must rest on (1) his *De Auctoritate S. Scripturæ*, and (2) his *De Jesu Christo Servatore*. The former was first published at Seville (1588) by Lopez, a Jesuit, who claimed it as his own, but prefixed a preface in which, contrary to a fundamental position of Sozzini, he maintains that man by nature has a knowledge of God. A French version (1592) was approved by the ministers of Basel, and the English translation (1731) by Edward Coombe was undertaken in consequence of the commendation of the work in a charge (1728) by Bishop Smalbroke, who observes that Grotius had laid it under contribution in his *De Veritate Christ. Rel.* In a small compass it anticipates the whole argument of the "credibility" writers, but in trying it by modern tests it should be remembered that Sozzini regarded it (in 1581) as not adequately meeting the cardinal difficulties attending the proof of the Christian religion, and subsequently began to reconstruct its argument in his unfinished *Lectiones Sacræ*. His treatise on salvation constitutes his main service to theology, placing orthodoxy and heresy in new relations of fundamental antagonism, and narrowing the conflict to the central interest of religion. Of the person of Christ in this treatise he says nothing; he deals exclusively with the work of Christ, which in his view operates upon man alone, and it is by the persistency with which this idea tends to recur that we must estimate the theological sagacity of Sozzini. Though his name has been attached to a school of opinion (Socinianism), he disclaimed the rôle of a heresiarch, and declined to give his unreserved adhesion to any one sect. The confidence with which he relied upon the conclusions of his own mind has gained him the repute of a dogmatist, but it was his constant aim to reduce and simplify the fundamentals of Christianity, and it is not without ground that the memorial tablet at Siena (inscription by Brigidi, 1879) characterizes him as a vindicator of human reason against the supernatural. Of his non-theological doctrines the most important is his assertion of the unlawfulness, not only of war, but of the taking of human life in any circumstances. Hence the comparative mildness of his proposals for dealing with religious offenders; but it cannot be said that he had grasped the full idea of toleration. Hence too his contention that magisterial office is unlawful for a Christian.

For the biography of Sozzini the best materials are his letters. There is a collection in his works; others are given by Cantù; some are unpublished. In his correspondence he delineates himself freely, not sparing his weak points of character or of attainment. The earliest life, prefixed (with engraved portrait) to the works, is by Przypkowski (1636), translated into English by Biddle (1653). This is the foundation of the article by Bayle, the *Memoirs* by Toulmin

[1] Biandrata was Sozzini's evil genius. Born of an old family in Piedmont and educated in France, Biandrata had attached himself to the left wing of Protestantism, and had moved here and there among the upper circles of the Reformed, depending for professional advancement on a special knowledge of the diseases of women. Driven eastwards a second time in 1558 (after fomenting antitrinitarian heresy in the Italian church of Geneva), he had for twenty years been the confidential adviser of ladies of the reigning house, first in Poland and then in Transylvania. In both countries he was a dexterous meddler in church affairs; his policy was the establishment of a kind of broad church, with a confession nakedly Scriptural in its terms, and a resolute suppression of all compromising extremes.

[2] No trace is discoverable on the stone of the alleged epitaph—

"Tota ruit Babylon; destruxit tecta Lutherus,
Calvinus muros, sed fundamenta Socinus."

(1777), and the *Life* by Wallace (*Antitrin. Biog.*, 1850, ii. 306). The sketch by Cantù in *Gli Eretici d'Italia*, 1866, vol. ii., gives a genealogy of the Sozzini (needing some correction). The best defence of Sozzini in his relations with David is by James Yates, in *Christ. Pioneer*, February 1834; a less favourable view is taken by the Hungarian biographer of David (Jakab, *David F. Emlek e*, 1879). Of his system, most generally known through the *Racovian Catechism*, 1605 (planned by Sozzini, but chiefly carried out by others, principally Schmalz; translated by Rees, 1818), there is a special study by Fock, *Der Socinianismus*, 1847. See also "The Sozzini and their School," in *Theol. Rev.*, 1879 (corrected in *Christ. Life*, 25th August 1883). Use has been made above of unpublished papers in the archives at Florence, with others in the archives, communal library, and collection of Padre Toti at Siena. (A. GO.)

SOCORRO, a town of the United States, in a county of the same name in New Mexico, 76 miles south of Albuquerque junction on the Atchison, Topeka, and Santa Fé Railroad, is beautifully situated in the Rio Grande valley. It is the centre of a silver and lead mining district, and has a stamp mill and smelting-works. Fruit-growing and cattle-breeding are prosecuted in the vicinity. The population, including old and new town, was about 5000 in 1887.

SOCOTRA, or SOCOTORA (Arabic *Sokoṭrá*), an island of the Indian Ocean, 150 miles from Cape Gardafui and about 220 from the Arabian coast. Its length from east to west is 71 miles, its greatest breadth 22. A plain 2 to 4 miles wide skirts the greater part of the coast, while the interior is mountainous. The granite peaks behind Tamarída (a village on the north coast and the chief place in the island, but now much decayed) rise to a height of 4000 feet, and a limestone chain connected with these runs north and south with an average height of about 1900 feet. The climate is moist, but not unhealthy, with much rain, especially during the south-west monsoon. At this season the temperature rises to 80° or even 95°, but on the whole the heat is not excessive. The scenery of the island is very striking, with bare rocky heights and fertile valleys; but there is little cultivation, the inhabitants living mainly by their vast flocks of sheep and goats, or on dates, home-grown and imported. Milch cows are numerous near Tamarída. The population is about 5000, of two distinct types. The nomad inhabitants of the uplands are a peculiar race, well built, with good features and long curling but not woolly hair; they resemble neither the Arabs nor the Somál. In Tamarída and other villages and towards the eastern end of the island the population is a mixture of Arab, African, and other elements, even including Portuguese. The native speech is not intelligible to ordinary Arabs, but Wellsted says that it can sometimes be made out by Arabs from the opposite (Mahra) coast. In fact, according to Ibn Mojáwir and Hamdání, the Socotrans in the Middle Ages were regarded as Mahra and spoke the Mahra dialect. Their way of life is rude and simple in the extreme, but they are hospitable and generally well-behaved, though they have almost no government; they are nominally dependent on the sultan of Keshín. A certain dependence (at least of places on the coast) on some sovereign of the Arabian coast has endured for many centuries, except during the short Portuguese occupation of Tamarída by Albuquerque. From 1876 to 1886 the sultan of Keshín was bound by treaty not to cede the island to a foreign power or allow settlements on it without the consent of England. In 1886 it was formally annexed by Great Britain.

The fauna and flora of Socotra are peculiar. As regards mammalia the civet cat is found, but the ordinary wild beasts of Arabia are unknown. The flora was studied by Professor Bailey Balfour in 1880, and his account of it is about to be published by the Royal Society of Edinburgh. The most valuable vegetable products are now, as in the Middle Ages, aloes and dragon's-blood. The Socotran aloes (the French *chicotin*) is esteemed the best in the world when unadulterated. In old times the ambergris of Socotra was also famous.

Socotra was known to the ancients as the isle of Dioscorides; this name, and that by which the island is now known, are usually traced back to a Sanscrit form, Dvípa-Sakhádhára, "the island abode of bliss," which again suggests an identification with the νῆσοι εὐδαίμονες of Agatharchides (§ 103). The *Periplus* of the Erythræan Sea speaks of the island as peopled only in one part by a mixed race of Arab, Indian, and Greek traders. It was subject to the king of the Incense Country, and was a meeting-place of Arabian and Indian ships. Cosmas in the 6th century says that the people spoke Greek and were largely Christian, with a bishop sent from Persia. The Arab geographers also had a tradition of an early Greek settlement (which they naturally ascribe to Alexander), but also of later Persian influence, followed by a settlement of Mahra tribes, who partly adopted Christianity. The Socotrans remained Nestorian Christians, with a bishop under the metropolitan of Persia, through the Middle Ages (Assemani, *B. O.*, ii. 459; comp. Mohallebí, in Abulfeda, p. 371); but in their isolated position they have gradually lost all trace of Christianity except reverence for the cross, and practise the old South Arabian moon worship. There was much more at least of the forms of Christianity when Europeans first visited the island in the 16th century. In the Middle Ages Socotra was a station of the Indian corsairs who harassed the Arab trade with the far East. The population seems then to have been much larger; Arabian writers estimate the fighting men at 10,000.

See, for the history of Socotra, Yule, *Marco Polo*, ii. 400 *sq.*, and, besides the authorities there cited, Yakút, *s.v.*, Hamdaní, p. 52, Kazwíni, ii. 54. For the state of the island at the beginning of the 18th century, see the account of the French expedition to Yemen in 1708 (*Viaggio nell' Arabia Felice*, Venice, 1721); and, for the present century, Wellsted, *City of the Caliphs*, vol. ii. (1840). For the topography, &c., see *Red Sea Pilot*, 2d ed., 1882.

SOCRATES, son of the statuary Sophroniscus and of the midwife Phænarete, was born at Athens, not earlier than 471 nor later than May or June 469 B.C. As a youth he received the customary instruction in gymnastic and music; and in after years he made himself acquainted with geometry and astronomy and studied the methods and the doctrines of the leaders of Greek thought and culture. He began life as a sculptor; and in the 2d century A.D. a group of the Graces, supposed to be his work, was still to be seen on the road to the Acropolis. But he soon abandoned art and gave himself to what may best be called education, conceiving that he had a divine commission, witnessed by oracles, dreams, and signs, not indeed to teach any positive doctrine, but to convict men of ignorance mistaking itself for knowledge, and by so doing to promote their intellectual and moral improvement. He was on terms of intimacy with some of the most distinguished of his Athenian contemporaries, and, at any rate in later life, was personally known to very many of his fellow citizens. His domestic relations were, it is said, unhappy. The shrewishness of his wife Xanthippe became proverbial with the ancients, as it still is with ourselves. Aristotle, in his remarks upon genius and its degeneracy (*Rhet.*, ii. 15), speaks of Socrates's sons as dull and fatuous; and in Xenophon's *Memorabilia*, one of them, Lamprocles, receives a formal rebuke for undutiful behaviour towards his mother.

Public life.

Socrates served as a hoplite at Potidæa (432-429), where on one occasion he saved the life of Alcibiades, at Delium (424), and at Amphipolis (422). In these campaigns his bravery and endurance were conspicuous. But, while he thus performed the ordinary duties of a Greek citizen with credit, he neither attained nor sought political position. His "divine voice," he said, had warned him to refrain from politics, presumably because office would have entailed the sacrifice of his principles and the abandonment of his proper vocation. Yet in 406 he was a member of the senate; and on the first day of the trial of the victors of Arginusæ, being president of the prytanes, he resisted—first, in conjunction with his colleagues, afterwards, when they yielded, alone—the illegal and unconstitutional proposal of Callixenus, that the fate of the eight generals should be decided by a single vote of the assembly. Not less courageous than this opposition to the "civium ardor prava jubentium" was his disregard of the "vultus instantis tyranni" two years later. During the reign of terror of 404 the Thirty, anxious to implicate in their crimes men of repute who might otherwise have opposed their plans, ordered five citizens, one of whom was Socrates, to go to

Salamis and bring thence their destined victim Leon Socrates alone disobeyed. But, though he was exceptionally obnoxious to the Thirty,—as appears, not only in this incident, but also in their threat of punishment under a special ordinance forbidding "the teaching of the art of argument,"—it was reserved for the reconstituted democracy to bring him to trial and to put him to death. In 399, four years after the restoration and the amnesty, he was indicted as an offender against public morality. His accusers were Meletus the poet, Anytus the tanner, and Lycon the orator, all of them members of the democratic or patriot party who had returned from Phyle with Thrasybulus. The accusation ran thus: "Socrates is guilty, firstly, of denying the gods recognized by the state and introducing new divinities, and secondly, of corrupting the young." In his unpremeditated defence, so far from seeking to conciliate his judges, Socrates defied them. He was found guilty by 280 votes, it is supposed, against 220. Meletus having called for capital punishment, it now rested with the accused to make a counter-proposition, and there can be little doubt that, had Socrates without further remark suggested some smaller but yet substantial penalty, the proposal would have been accepted. But, to the amazement of the judges and the distress of his friends, Socrates proudly declared that for the services which he had rendered to the city he deserved, not punishment, but the reward of a public benefactor,—maintenance in the Prytaneum at the cost of the state, and, although at the close of his speech he professed himself willing to pay a fine of one mina, and upon the urgent entreaties of his friends raised the amount of his offer to thirty minas, he made no attempt to disguise his indifference to the result. His attitude exasperated the judges, and the penalty of death was decreed by an increased majority. Then in a short address Socrates declared his contentment with his own conduct and with the sentence. Whether death was a dreamless sleep or a new life in Hades, where he would have opportunities of testing the wisdom of the heroes and the sages of antiquity, in either case he esteemed it a gain to die. In the same spirit he refused to take advantage of a scheme arranged by his friend Crito for an escape from prison. Under ordinary circumstances the condemned criminal drank the cup of hemlock on the day after the trial; but in the case of Socrates the rule that during the absence of the sacred ship sent annually to Delos no one should be put to death caused an exceptional delay. For thirty days he remained in imprisonment, receiving his intimates and conversing with them in his accustomed manner. How in his last conversation he argued that the wise man will regard approaching death with a cheerful confidence Plato relates in the *Phædo*; and, while the central argument—which rests the doctrine of the soul's immortality upon the theory of ideas—must be accounted Platonic, in all other respects the narrative, though not that of an eye witness, has the air of accuracy and truth.

But what were the personal characteristics which won for this man, poor in worldly goods, the affectionate regard of the best of his contemporaries? Why was it that the Athenians, forgetting his loyal performance of civic duties, his virtuous life, and his disinterested anxiety for their welfare, brought him to trial, condemned him, put him to death? What were the principles upon which his teaching rested, and what was the message which, instant in season, out of season, he carried to his countrymen? How were his principles interpreted by his followers, and what influence did his teaching exert upon subsequent speculation? These are the questions which demand consideration in the present article.

Authorities. Happily, though Socrates left no writings behind him, and indeed, as will hereafter appear, was by his principles precluded from dogmatic exposition, we have in the Ἀπομνημονεύματα or *Memoirs* and other works of Xenophon records of Socrates's conversation, and in the dialogues of Plato refined applications of his method. Xenophon, having no philosophical views of his own to develop, and no imagination to lead him astray,—being, in fact, to Socrates what Boswell was to Johnson,—is an excellent witness. The Ἀπομνημονεύματα or *Memorabilia* are indeed confessedly apologetic, and it is easy to see that nothing is introduced which might embitter those who, hating Socrates, were ready to persecute the Socratics; but the plain, straightforward narrative of Socrates's talk, on many occasions, with many dissimilar interlocutors, carries with it in its simplicity and congruity the evidence of substantial justice and truth. Plato, though he understood his master better, is a less trustworthy authority, as he makes Socrates the mouthpiece of his own more advanced and even antagonistic doctrine. Yet to all appearance the *Apology* is a careful and exact account of Socrates's habits and principles of action; the earlier dialogues, those which are commonly called "Socratic," represent, with such changes only as are necessitated by their form, Socrates's method; and, if in the later and more important dialogues the doctrine is the doctrine of Plato, echoes of the master's teaching are still discoverable, approving themselves as such by their accord with the Xenophontean testimony. In the face of these two principal witnesses other evidence is of small importance.

Personal Characteristics.—What, then, were the personal characteristics of the man? Outwardly his presence was mean and his countenance grotesque. Short of stature, thick-necked, and somewhat corpulent, with prominent eyes, with nose upturned and nostrils outspread, with large mouth and coarse lips, he seemed the embodiment of sensuality and even stupidity. Inwardly he was, as his friends knew, "so pious that he did nothing without taking counsel of the gods, so just that he never did an injury to any man, whilst he was the benefactor of his associates, so temperate that he never preferred pleasure to right, so wise that in judging of good and evil he was never at fault,—in a word, the best and the happiest of men." "His self control was absolute; his powers of endurance were unfailing; he had so schooled himself to moderation that his scanty means satisfied all his wants." "To want nothing," he said himself, "is divine; to want as little as possible is the nearest possible approach to the divine life"; and accordingly he practised temperance and self-denial to a degree which some thought ostentatious and affected. Yet the hearty enjoyment of social pleasures was another of his marked characteristics; for to abstain from innocent gratification from fear of falling into excess would have seemed to him to imply either a pedantic formalism or a lack of real self-control. In short, his strength of will, if by its very perfection it led to his theoretical identification of virtue and knowledge, secured him in practice against the ascetic extravagances of his associate Antisthenes.

Personal appearance.

Moral qualities.

The intellectual gifts of Socrates were hardly less remarkable than his moral virtues. Naturally observant, acute, and thoughtful, he developed these qualities by constant and systematic use. The exercise of the mental powers was, he conceived, no mere occupation of leisure hours, but rather a sacred and ever-present duty; because, moral error being intellectual error translated into act, he who would live virtuously must first rid himself of ignorance and folly. He had, it may be conjectured, but little turn for philosophical speculation; yet by the careful study of the ethical problems which met him in himself and in others he acquired a remarkable tact in dealing with questions of practical morality; and in the course of

Intellectual gifts.

the lifelong war which he waged against vagueness of thought and laxity of speech he made himself a singularly apt and ready reasoner.

Philanthropy. While he regarded the improvement, not only of himself but also of others, as a task divinely appointed to him, there was in his demeanour nothing exclusive or pharisaical. On the contrary, deeply conscious of his own limitations and infirmities, he felt and cherished a profound sympathy with erring humanity, and loved with a love passing the love of women fellow-men who had not learnt, as he had done, to overcome human frailties and weaknesses. Nevertheless great wrongs roused in him a righteous indignation which sometimes found expression in fierce and angry rebuke. Indeed it would seem that Plato in his idealized portrait gives his hero credit not only for a deeper philosophical insight but also for a greater urbanity than facts warranted. Hence, whilst those who knew him best met his affection with a regard equal to his own, there were, as will be seen hereafter, some who never forgave his stern reproofs, and many who regarded him as an impertinent busybody.

Patriotism. He was a true patriot. Deeply sensible of his debt to the city in which he had been born and bred, he thought that in giving his life to the spread of sounder views in regard to ethical and political subjects he made no more than an imperfect return; and, when in the exercise of constitutional authority that city brought him to trial and threatened him with death, it was not so much his local attachment, strong though that sentiment was, as rather his sense of duty which forbade him to retire into exile before the trial began, to acquiesce in a sentence of banishment when the verdict had been given against him, and to accept the opportunity of escape which was offered him during his imprisonment. Yet his patriotism had none of the narrowness which was characteristic of the patriotism of his Greek contemporaries. His generous benevolence and unaffected philanthropy taught him to overstep the limits of the Athenian demus and the Hellenic race, and to regard himself as a "citizen of the world."

Humour. He was blest with an all-pervading humour, a subtle but kindly appreciation of the incongruities of human nature and conduct. In a less robust character this quality might have degenerated into sentimentality or cynicism; in Socrates, who had not a trace of either, it showed itself principally in what his contemporaries knew as his "accustomed irony." Profoundly sensible of the inconsistencies of his own thoughts and words and actions, and shrewdly suspecting that the like inconsistencies were to be found in other men, he was careful always to place himself upon the standpoint of ignorance and to invite others to join him there, in order that, proving all things, he and they might hold fast that which is good. "Intellectually the acutest man of his age," says W. H. Thompson in a brilliant and instructive appendix to his edition of Plato's *Phædrus*, "he represents himself in all companies as the dullest person present. Morally the purest, he affects to be the slave of passion, and borrows the language of gallantry to describe a benevolence too exalted for the comprehension of his contemporaries. He is by turns an ἐραστής, a προαγωγός, a μαστροπός, a μαιευτικός, disguising the sanctity of his true vocation by names suggestive of vile or ridiculous images. The same spirit of whimsical paradox leads him, in Xenophon's *Banquet*, to argue that his own satyr-like visage was superior in beauty to that of the handsomest man present. That this irony was to some extent calculated is more than probable; it disarmed ridicule by anticipating it; it allayed jealousy and propitiated envy; and it possibly procured him admission into gay circles from which a more solemn teacher would have been excluded. But it had for its basis a real greatness of soul, a hearty and unaffected disregard of public opinion, a perfect disinterestedness, an entire abnegation of self. He made himself a fool that others by his folly might be made wise; he humbled himself to the level of those among whom his work lay that he might raise some few among them to his own level; he was 'all things to all men, if by any means he might win some.'" It would seem that this humorous depreciation of his own great qualities, this pretence of being no better than his neighbours, led to grave misapprehension amongst his contemporaries. That it was the foundation of the slanders of the Peripatetic Aristoxenus can hardly be doubted.

Piety. Socrates was further a man of sincere and fervent piety. "No one," says Xenophon, "ever knew of his doing or saying anything profane or unholy." There was indeed in the popular mythology much which he could not accept. It was incredible, he argued, that the gods should have committed acts which would be disgraceful in the worst of men. Such stories, then, must be regarded as the inventions of lying poets. But, when he had thus purified the contemporary polytheism, he was able to reconcile it with his own steadtast belief in a Supreme Being, the intelligent and beneficent Creator of the universe, and to find in the national ritual the means of satisfying his religious aspirations. For proof of the existence of "the divine," he appealed to the providential arrangement of nature, to the universality of the belief, and to the revelations and warnings which are given to men through signs and oracles. Thinking that the soul of man partook of the divine, he maintained the doctrine of its immortality as an article of faith, but not of knowledge. While he held that, the gods alone knowing what is for man's benefit, man should pray, not for particular goods, but only for that which is good, he was regular in prayer and punctual in sacrifice. He looked to oracles and signs for guidance in those matters, and in those matters only, which could not be resolved by experience and judgment, and he further supposed himself to receive special warnings of a mantic character through what he called his "divine sign" (δαιμόνιον, δαιμόνιον σημεῖον).

Divine sign. Socrates's frequent references to his "divine sign" were, says Xenophon, the origin of the charge of "introducing new divinities" brought against him by his accusers, and in early Christian times, amongst Neoplatonic philosophers and fathers of the church, gave rise to the notion that he supposed himself to be attended by a "genius" or "dæmon." Similarly in our own day spiritualists have attributed to him the belief—which they justify—in "an intelligent spiritual being who accompanied him through life,—in other words, a guardian spirit" (A. R. Wallace). But the very precise testimony of Xenophon and Plato shows plainly that Socrates did not regard his "customary sign" either as a divinity or as a genius. According to Xenophon, the sign was a warning, either to do or not to do which it would be folly to neglect, not superseding ordinary prudence, but dealing with those uncertainties in respect of which other men found guidance in oracles and tokens; Socrates believed in it profoundly, and never disobeyed it. According to Plato, the sign was a "voice" which warned Socrates to refrain from some act which he contemplated; he heard it frequently and on the most trifling occasions; the phenomenon dated from his early years, and was, so far as he knew, peculiar to himself. These statements have been variously interpreted. Thus it has been maintained that, in laying claim to supernatural revelations, Socrates (1) committed a pious fraud, (2) indulged his "accustomed irony," (3) recognized the voice of conscience, (4) indicated a general belief in a divine mission, (5) described "the inward voice of his individual tact, which in consequence partly of his experience and penetration, partly of his knowledge of himself and exact appreciation of what was in harmony with his individuality, had attained to an unusual accuracy," (6) was mad ("était fou"), being subject not only to hallucinations of sense but also to aberrations of reason. Xenophon's testimony that Socrates was plainly sincere in his belief excludes the first and the second of these theories; the character of the warnings given, which are always concerned, not with the moral worth of actions, but with their uncertain results, warrants the rejection of the third and the fourth; the fifth, while it sufficiently accounts for the matter of the warning, leaves unexplained its manner, the vocal utterance; the sixth, while it plausibly ex-

plains the manner of the warning, goes beyond the facts when it attributes to it irrationality of matter. It remains for us, then, modifying the fifth hypothesis, that of Diderot, Zeller, and others, and the sixth, that of Lélut and Littré, and combining the two, to suppose that Socrates was subject, not indeed to delusions of mind, but to hallucinations of the sense of hearing, so that the rational suggestions of his own brain, exceptionally valuable in consequence of the accuracy and delicacy of his highly cultivated tact, seemed to him to be projected without him, and to be returned to him through the outward ear. It appears that, though in some of the best known instances—for example, those of Cowper and Sidney Walker—hallucinations of the sense of hearing, otherwise closely resembling Socrates's "divine sign," have been accompanied by partial derangement of reason, cases are not wanting in which "the thoughts transformed into external sensorial impressions" are perfectly rational.

Mode of life. The eccentricity of Socrates's life was not less remarkable than the oddity of his appearance and the irony of his conversation. His whole time was spent in public,—in the market-place, the streets, the gymnasia. Thinking with Dr Johnson that "a great city is the school for studying life," he had no liking for the country, and seldom passed the gates. "Fields and trees," Plato makes him say, "won't teach me anything; the life of the streets will." He talked to all comers,—to the craftsman and the artist as willingly as to the poet or the politician,—questioning them about their affairs, about the processes of their several occupations, about their notions of morality, in a word, about familiar matters in which they might be expected to take an interest. The ostensible purpose of these interrogatories was to test, and thus either refute or explain, the famous oracle which had pronounced him the wisest of men. Conscious of his own ignorance, he had at first imagined that the God was mistaken. When, however, experience showed that those who esteemed themselves wise were unable to give an account of their knowledge, he had to admit that, as the oracle had said, he was wiser than others, in so far as, whilst they, being ignorant, supposed themselves to know, he, being ignorant, was aware of his ignorance. Such, according to the *Apology*, was Socrates's account of his procedure and its results. But it is easy to see that the statement is coloured by the accustomed irony. When in the same speech Socrates tells his judges that he would never from fear of death or any other motive disobey the command of the god, and that, if they put him to death, the loss would be, not his, but theirs, since they would not readily find any one to take his place, it becomes plain that he conceived himself to hold a commission to educate, and was consciously seeking the intellectual and moral improvement of his countrymen. His end could not be achieved without the sacrifice of self. His meat and drink were of the poorest; summer and winter his coat was the same; he was shoeless and shirtless. "A slave whose master made him live as you do," says a sophist in the *Memorabilia*, "would run away." But by the surrender of the luxuries and the comforts of life Socrates secured for himself the independence which was necessary that he might go about his appointed business, and therewith he was content.

Contemporary judgments. His message was to all, but it was variously received. Those who heard him perforce and occasionally were apt to regard his teaching either with indifference or with irritation,—with indifference if, as might be, they failed to see in the elenchus anything more than elaborate trifling; with irritation if, as was probable, they perceived that, in spite of his assumed ignorance, Socrates was well aware of the result to which their enforced answers tended. Amongst those who deliberately sought and sedulously cultivated his acquaintance there were some who attached themselves to him as they might have attached themselves to any ordinary sophist, conceiving that by temporary contact with so acute a reasoner they would best prepare themselves for the logomachies of the law courts, the assembly, and the senate. Again, there were others who saw in Socrates at once master, counsellor, and friend, and hoped by associating with him "to become good men and true, capable of doing their duty by house and household, by relations and friends, by city and fellow-citizens" (Xenophon). Finally, there was a little knot of intimates who, having something of Socrates's enthusiasm, entered more deeply than the rest into his principles, and, when he died, transmitted them to the next generation. Yet even those who belonged to this inner circle were united, not by any common doctrine, but by a common admiration for their master's intellect and character.

For the paradoxes of Socrates's personality and the eccentricity of his behaviour, if they offended the many, fascinated the few. Plato's panegyric. "It is not easy for a man in my condition," says the intoxicated Alcibiades in Plato's *Symposium*, "to describe the singularity of Socrates's character. But I will try to tell his praises in similitudes. He is like the piping Silenes in the statuaries' shops, which, when you open them, are found to contain images of gods. Or, again, he is like the satyr Marsyas, not only in outward appearance—that, Socrates, you will yourself allow—but in other ways also. Like him, you are given to frolic; —I can produce evidence to that; and, above all, like him, you are a wonderful musician. Only there is this difference,—what he does with the help of his instrument you do with mere words; for whatsoever man, woman, or child hears you, or even a feeble report of what you have said, is struck with awe and possessed with admiration. As for myself, were I not afraid that you would think me more drunk than I am, I would tell you on oath how his words have moved me,—ay, and how they move me still. When I listen to him my heart beats with a more than Corybantic excitement; he has only to speak and my tears flow. Orators, such as Pericles, never moved me in this way,—never roused my soul to the thought of my servile condition; but this Marsyas makes me think that life is not worth living so long as I am what I am. Even now, if I were to listen, I could not resist. So there is nothing for me but to stop my ears against this siren's song and fly for my life, that I may not grow old sitting at his feet. No one would think that I had any shame in me; but I am ashamed in the presence of Socrates."

The Accusation and its Causes.—The life led by Socrates was not likely to win for him either the affection or the esteem of the vulgar. Popular prejudices. Those who did not know him personally, seeing him with the eyes of the comic poets, conceived him as a "visionary" (μετεωρολόγος) and a "bore" (ἀδολέσχης). Those who had faced him in argument, even if they had not smarted under his rebukes, had at any rate winced under his interrogatory, and regarded him in consequence with feelings of dislike and fear. But the eccentricity of his genius and the ill-will borne towards him by individuals are not of themselves sufficient to account for the tragedy of 399. It thus becomes necessary to study the circumstances of the trial, and to investigate the motives which led the accusers to seek his death and the people of Athens to acquiesce in it.

Socrates was accused (1) of denying the gods recognized by the state and introducing instead of them strange divinities (δαιμόνια), and (2) of corrupting the young. The accusation. The first of these charges rested upon the notorious fact that he supposed himself to be guided by a divine visitant or sign (δαιμόνιον). The second, Xenophon tells us, was supported by a series of particular allegations,—(*a*) that he taught his associates to despise the institutions of the state, and especially election by lot; (*b*) that he had numbered amongst his associates Critias and Alcibiades, the most dangerous of the representatives of the oligarchical and democratical parties respectively; (*c*) that he taught the

young to disobey parents and guardians and to prefer his own authority to theirs, (*d*) that he was in the habit of quoting mischievous passages of Homer and Hesiod to the prejudice of morality and democracy.

Strength of the defence

It is plain that the defence was not calculated to conciliate a hostile jury. Nevertheless, it is at first sight difficult to understand how an adverse verdict became possible. If Socrates rejected portions of the conventional mythology, he accepted the established faith and performed its offices with exemplary regularity. If he talked of a *δαιμόνιον*, the *δαιμόνιον* was no new divinity, but a mantic sign divinely accorded to him, presumably by the gods of the state. If he questioned the propriety of certain of the institutions of Athens, he was prepared to yield an unhesitating obedience to all. He had never countenanced the misdeeds of Critias and Alcibiades, and indeed, by a sharp censure, had earned the undying hatred of one of them. Duty to parents he inculcated as he inculcated other virtues; and, if he made the son wiser than the father, surely that was not a fault. The citation of a few lines from the poets ought not to weigh against the clear evidence of his large-hearted patriotism; and it might be suspected that the accuser had strangely misrepresented his application of the familiar words.

Its weakness

To the modern reader Xenophon's reply, of which the foregoing paragraph is in effect a summary, will probably seem sufficient, and more than sufficient. But it must not be forgotten that Athenians of the old school approached the subject from an entirely different point of view. Socrates was in all things an innovator,—in religion, inasmuch as he sought to eliminate from the theology of his contemporaries "those lies which poets tell"; in politics, inasmuch as he distrusted several institutions dear to Athenian democracy; in education, inasmuch as he waged war against authority, and in a certain sense made each man the measure of his own actions. It is because Socrates was an innovator that we, who see in him the founder of philosophical inquiry, regard him as a great man; it was because Socrates was an innovator that old-fashioned Athenians, who saw in the new-fangled culture the origin of all their recent distresses and disasters, regarded him as a great criminal. It is, then, after all in no wise strange that a majority was found first to pronounce him guilty, and afterwards, when he refused to make any submission and professed himself indifferent to any mitigation of the penalty, to pass upon him the sentence of death. That the verdict and the sentence were not in any way illegal is generally acknowledged.

Occasion of the attack

But, though the popular distrust of eccentricity, the irritation of individuals and groups of individuals, the attitude of Socrates himself, and the prevalent dislike of the intellectual movement which he represented go far to account for the result of the trial, they do not explain the occasion of the attack. Socrates's oddity and brusquerie were no new things; yet in the past, though they had made him unpopular, they had not brought him into the courts. His sturdy resistance to the demus in 406 and to the Thirty in 404 had passed, if not unnoticed, at all events unpunished. His political heresies and general unorthodoxy had not caused him to be excluded from the amnesty of 403. Why was it, then, that in 399, when Socrates's idiosyncrasies were more than ever familiar, and when the constitution had been restored, the toleration hitherto extended to him was withdrawn? What were the special circumstances which induced three members of the patriot party, two of them leading politicians, to unite their efforts against one who apparently was so little formidable?

Political reasons for it

For an answer to this question it is necessary to look to the history of Athenian politics. Besides the oligarchical party, properly so called, which in 411 was represented by the Four Hundred and in 404 by the Thirty, and the democratical party, which returned to power in 410 and in 403, there was at Athens during the last years of the Peloponnesian War a party of "moderate oligarchs," antagonistic to both. It was to secure the cooperation of the moderate party that the Four Hundred in 411 promised to constitute the Five Thousand, and that the Thirty in 404 actually constituted the Three Thousand. It was in the hope of realizing the aspirations of the moderate party that Theramenes, its most prominent representative, allied himself, first with the Four Hundred, afterwards with the Thirty. In 411 the policy of Theramenes was temporarily successful, the Five Thousand superseding the Four Hundred. In 404 the Thirty outwitted him; for, though they acted upon his advice so far as to constitute the Three Thousand, they were careful to keep all real power in their own hands. But on both occasions the "polity"—for such, in the Aristotelian sense of the term, the constitution of 411-410 was, and the constitution of 404-403 professed to be—was insecurely based, so that it was not long before the "unmixed democracy" was restored. The programme of the "moderates"—which included (1) the limitation of the franchise, by the exclusion of those who were unable to provide themselves with the panoply of a hoplite and thus to render to the city substantial service, (2) the abolition of payment for the performance of political functions, and, as it would seem, (3) the disuse of the lot in the election of magistrates—found especial favour with the intellectual class. Thus Alcibiades and Antiphon were amongst its promoters, and Thucydides commends the constitution established after the fall of the Four Hundred as the best which in his time Athens had enjoyed. Now it is expressly stated that Socrates disliked election by lot; it is certain that, regarding paid educational service as a species of prostitution, he would account paid political service not a whit less odious; and the stress laid by the accuser upon the Homeric quotation (*Iliad*, ii. 188-202)—which ends with the lines *δαιμόνι', ἀτρέμας ἧσο, καὶ ἄλλων μῦθον ἄκουε οἳ σέο φέρτεροί εἰσι· σὺ δ' ἀπτόλεμος καὶ ἄναλκις, οὔτε ποτ' ἐν πολέμῳ ἐναρίθμιος οὔτ' ἐνὶ βουλῇ*—becomes intelligible if we may suppose that Socrates, like Theramenes, wished to restrict the franchise to those who were rich enough to serve as hoplites at their own expense. Thus, as might have been anticipated, Socrates was a "moderate," and the treatment which he received from both the extreme parties suggests—even if with Grote we reject the story told by Diodorus (xiv. 5), how, when Theramenes was dragged from the altar, Socrates attempted a rescue—that his sympathy with the moderate party was pronounced and notorious. Even in the moment of democratic triumph the "moderates" made themselves heard, Phormisius proposing that those alone should exercise the franchise who possessed land in Attica; and it is reasonable to suppose that their position was stronger in 399 than in 403. These considerations seem to indicate an easy explanation of the indictment of Socrates by the democratic politicians. It was a blow struck at the "moderates," Socrates being singled out for attack because, though not a professional politician, he was the very type of the malcontent party, and had done much, probably more than any man living, to make and to foster views which, if not in the strict sense of the term oligarchical, were confessedly hostile to the "unmixed democracy." His eccentricity and heterodoxy, as well as the personal animosities which he had provoked, doubtless contributed, as his accusers had foreseen, to bring about the conviction; but, in the judgment of the present writer, it was the fear of what may be called "philosophical radicalism" which prompted the action of Meletus, Anytus, and Lycon. The result did not disappoint their expectations. The friends of Socrates

abandoned the struggle and retired into exile, and, when they returned to Athens, the most prominent of them, Plato, was careful to confine himself to theory, and to announce in emphatic terms his withdrawal from the practical politics of his native city.

Method and Doctrine.—Socrates was not a "philosopher," nor yet a "teacher," but rather an "educator," having for his function "to rouse, persuade, and rebuke" (Plato, *Apology*, 30 E). Hence, in examining his life's work it is proper to ask, not What was his philosophy? but What was his theory, and what was his practice, of education? It is true that he was brought to his theory of education by the study of previous philosophies, and that his practice led to the Platonic revival; but to attribute to him philosophy, except in that loose sense in which philosophy is ascribed to one who, denying the existence of such a thing, can give an account of his disbelief, is misleading and even erroneous.

Theory of education.

Socrates's theory of education had for its basis a profound and consistent scepticism; that is to say, he not only rejected the conflicting theories of the physicists,—of whom "some conceived existence as a unity, others as a plurality; some affirmed perpetual motion, others perpetual rest; some declared becoming and perishing to be universal, others altogether denied such things,"—but also condemned, as a futile attempt to transcend the limitations of human intelligence, their φιλοσοφία, their "pursuit of knowledge for its own sake." Unconsciously, or more probably consciously, Socrates rested his scepticism upon the Protagorean doctrine that man is the measure of his own sensations and feelings; whence he inferred, not only that knowledge such as the philosophers had sought, certain knowledge of nature and its laws, was unattainable, but also that neither he nor any other person had authority to overbear the opinions of another, or power to convey instruction to one who had it not. Accordingly, whereas Protagoras and others, abandoning physical speculation and coming forward as teachers of culture, claimed for themselves in this new field power to instruct and authority to dogmatize, Socrates, unable to reconcile himself to this inconsistency, proceeded with the investigation of principles until he found a resting place, a ποῦ στῶ, in the distinction between good and evil. While all opinions were equally true, of those opinions which were capable of being translated into act some, he conceived, were as working hypotheses more serviceable than others. It was here that the function of such a one as himself began. Though he had neither the right nor the power to force his opinions upon another, he might by a systematic interrogatory lead another to substitute a better opinion for a worse, just as a physician by appropriate remedies may enable his patient to substitute a healthy sense of taste for a morbid one. To administer such an interrogatory and thus to be the physician of souls was, Socrates thought, his divinely appointed duty; and, when he described himself as a "talker" or "converser," he not only negatively distinguished himself from those who, whether philosophers or sophists, called themselves "teachers" (διδάσκαλοι), but also positively indicated the method of question and answer (διαλεκτική) which he consistently preferred and habitually practised.

Dialectical method.

That it was in this way that Socrates was brought to regard "dialectic," "question and answer," as the only admissible method of education is, in the opinion of the present writer, no matter of mere conjecture. In the review of theories of knowledge which has come down to us in Plato's *Theaetetus* mention is made (172 B) of certain "incomplete Protagoreans," who held that, while all impressions are equally true, one impression is better than another, and that the "wise man" is one who by his arguments causes good impressions to take the place of bad ones, thus reforming the soul of the individual or the laws of a state by a process similar to that of the physician or the farmer (166 D sq.); and these "incomplete Protagoreans" are identified with Socrates and the Socratics by their insistence (167 D) upon the characteristically Socratic distinction between disputation and dialectic, as well as by other familiar traits of Socratic converse. In fact, this passage becomes intelligible and significant if it is supposed to refer to the historical Socrates; and by teaching us to regard him as an "incomplete Protagorean" it supplies the link which connects his philosophical scepticism with his dialectical theory of education. It is no doubt possible that Socrates was unaware of the closeness of his relationship to Protagoras; but the fact, once stated, hardly admits of question.

Its two processes.

In the application of the "dialectical" or "maieutic" method two processes are distinguishable,—the destructive process, by which the worse opinion was eradicated, and the constructive process, by which the better opinion was induced. In general it was not mere "ignorance" with which Socrates had to contend, but "ignorance mistaking itself for knowledge" or "false conceit of wisdom,"—a more stubborn and a more formidable foe, who, safe so long as he remained in his entrenchments, must be drawn from them, circumvented, and surprised. Accordingly, taking his departure from some apparently remote principle or proposition to which the respondent yielded a ready assent, Socrates would draw from it an unexpected but undeniable consequence which was plainly inconsistent with the opinion impugned. In this way he brought his interlocutor to pass judgment upon himself, and reduced him to a state of "doubt" or "perplexity" (ἀπορία). "Before I ever met you," says Meno in the dialogue which Plato called by his name (79 E), "I was told that you spent your time in doubting and leading others to doubt; and it is a fact that your witcheries and spells have brought me to that condition; you are like the torpedo: as it benumbs any one who approaches and touches it, so do you. For myself, my soul and my tongue are benumbed, so that I have no answer to give you." Even if, as often happened, the respondent, baffled and disgusted by the ἔλεγχος or destructive process, at this point withdrew from the inquiry, he had, in Socrates's judgment, gained something; for whereas formerly, being ignorant, he had supposed himself to have knowledge, now, being ignorant, he was in some sort conscious of his ignorance, and accordingly would be for the future more circumspect in action. If, however, having been thus convinced of ignorance, the respondent did not shrink from a new effort, Socrates was ready to aid him by further questions of a suggestive sort. Consistent thinking with a view to consistent action being the end of the inquiry, Socrates would direct the respondent's attention to instances analogous to that in hand, and so lead him to frame for himself a generalization from which the passions and the prejudices of the moment were, as far as might be, excluded. In this constructive process, though the element of surprise was no longer necessary, the interrogative form was studiously preserved, because it secured at each step the conscious and responsible assent of the learner.

Maieutic in Plato and Xenophon.

Of the two processes of the dialectical method, the ἔλεγχος or destructive process attracted the more attention, both in consequence of its novelty and because many of those who willingly or unwillingly submitted to it stopped short at the stage of "perplexity." But to Socrates and his intimates the constructive process was the proper and necessary sequel. It is true that in the dialogues of Plato the destructive process is not always, or even often, followed by construction, and that in the *Memorabilia* of Xenophon construction is not always, or even often, preceded by the destructive process. There is, however, in this nothing surprising. On the one hand, Xenophon, having for his principal purpose the defence of his master against vulgar calumny, seeks to show by effective examples the excellence of his positive teaching, and accordingly is not careful to distinguish still less to emphasize, the negative procedure. On the other hand, Plato's aim being not so much to preserve Socrates's positive teaching as rather by written words to stimulate the reader to self scrutiny, just as the spoken words of the master had stimulated the hearer, he is compelled by the very nature of his task to keep the constructive element in the background, and, where Socrates would have drawn an unmistakable conclusion, to confine himself to enigmatical hints. For example, when we compare Xenophon's *Memorabilia*, iv. 6, 2-4, with Plato's *Euthyphro*, we note that, while in the former the interlocutor is led by a few suggestive questions to define "piety" as "the knowledge of those laws which are concerned with the gods," in the latter, though on a further scrutiny it appears that "piety" is "that part of justice which is concerned with the service of the gods," the conversation is ostensibly inconclusive. In short, Xenophon, a mere reporter of Socrates's conversations, gives the results, but troubles himself little about the steps which led to them; Plato, who in early manhood was an educator of the Socratic type, withholds the results that he may secure the advantages of the elenctic stimulus.

Induction and definition.

What, then, were the positive conclusions to which Socrates carried his hearers? and how were those positive conclusions obtained? Turning to Xenophon for an answer to these questions, we note (1) that the recorded conversations are concerned with practical action, political, moral, or artistic; (2) that in general there is a process from the known to the unknown through a generalization, expressed or implied; (3) that the generalizations are sometimes rules of conduct, justified by examination of known instances, sometimes definitions similarly established. Thus, in *Memorabilia*, iv. 1, 3, Socrates argues from the known instances of horses and dogs that the best natures stand most in need of training, and then applies the generalization to the instance under discussion, that of men; and in iv. 6, 13-14, he leads his interlocutor to a definition of "the good citizen," and then uses it to decide between two citizens for whom respectively superiority is claimed. Now in the former of these cases the process—which Aristotle would describe as "example" (παράδειγμα), and a modern might regard as "induction" of an uncritical sort—sufficiently explains itself. The conclusion is a provisional assurance that in the particular matter in hand a certain course of action is, or is not, to be adopted. But it is necessary to say a word of explanation about the latter case, in which, the generalization being a definition, that is to say, a declaration that to a given term the interlocutor attaches in general a specified meaning, the conclusion is a provisional assurance that the interlocutor may, or may not, with-

out falling into inconsistency, apply the term in question to a certain person or act. Moral error, Socrates conceived, is largely due to the misapplication of general terms, which, once affixed to a person or to an act, possibly in a moment of passion or prejudice, too often stand in the way of sober and careful reflection. It was in order to exclude error of this sort that Socrates insisted upon τὸ ὁρίζεσθαι καθόλου with ἐπακτικοὶ λόγοι for its basis. By requiring a definition and the reference to it of the act or person in question, he sought to secure in the individual at any rate consistency of thought, and, in so far, consistency of action. Accordingly he spent his life in seeking and helping others to seek "the what" (τὸ τί), or the definition, of the various words by which the moral quality of actions is described, valuing the results thus obtained, not as contributions to knowledge, but as means to right action in the multifarious relations of life.

Virtue is knowledge. While, however, Socrates sought neither knowledge, which in the strict sense of the word he held to be unattainable, nor yet, except as a means to right action, true opinion, the results of observation accumulated until they formed, not perhaps a system of ethics, but at any rate a body of ethical doctrine. Himself blessed with a will so powerful that it moved almost without friction, he fell into the error of ignoring its operations, and was thus led to regard knowledge as the sole condition of well doing. Where there is knowledge,—that is to say, practical wisdom (φρόνησις), the only knowledge which he recognized,—right action, he conceived, follows of itself; for no one knowingly prefers what is evil; and, if there are cases in which men seem to act against knowledge, the inference to be drawn is, not that knowledge and wrongdoing are compatible, but that in the cases in question the supposed knowledge was after all ignorance. Virtue, then, is knowledge, knowledge at once of end and of means irresistibly realizing itself in act. Whence it follows that the several virtues which are commonly distinguished are essentially one. "Piety," "justice," "courage," and "temperance" are the names which "wisdom" bears in different spheres of action: to be pious is to know what is due to the gods; to be just is to know what is due to men; to be courageous is to know what is to be feared and what is not; to be temperate is to know how to use what is good and avoid what is evil. Further, inasmuch as virtue is knowledge, it can be acquired by education and training, though it is certain that one soul has by nature a greater aptitude than another for such acquisition.

Theory of the Good. But, if virtue is knowledge, what has this knowledge for its object? To this question Socrates replies, Its object is the Good. What, then, is the Good? It is the useful, the advantageous. Utility, the immediate utility of the individual, thus becomes the measure of conduct and the foundation of all moral rule and legal enactment. Accordingly, each precept of which Socrates delivers himself is recommended on the ground that obedience to it will promote the pleasure, the comfort, the advancement, the wellbeing of the individual; and Prodicus's apologue of the Choice of Heracles, with its commonplace offers of worldly reward, is accepted as an adequate statement of the motives of virtuous action. Of the graver difficulties of ethical theory Socrates has no conception, having, as it would seem, so perfectly absorbed the lessons of what Plato calls "political virtue" that morality has become with him a second nature, and the scrutiny of its credentials from an external standpoint has ceased to be possible. His theory is indeed so little systematic that, whereas, as has been seen, virtue or wisdom has the Good for its object, he sometimes identifies the Good with virtue or wisdom, thus falling into the error which Plato (*Republic*, vi. 505 C), perhaps with distinct reference to Socrates, ascribes to certain "cultivated thinkers." In short, the ethical theory of Socrates, like the rest of his teaching, is by confession unscientific; it is the statement of the convictions of a remarkable nature, which statement emerges in the course of an appeal to the individual to study consistency in the interpretation of traditional rules of conduct. For a critical examination of the ethical teaching which is here described in outline, see ETHICS.

The Socratics.

It has been seen that, so far from having any system, physical or metaphysical, to enunciate, Socrates rejected "the pursuit of knowledge for its own sake" as a delusion and a snare,—a delusion, inasmuch as knowledge, properly so called, is unattainable, and a snare, in so far as the pursuit of it draws us away from the study of conduct. He has therefore no claim to be regarded as the founder of a philosophical school. But he had made some tentative contributions to a theory of morality, he had shown both in his life and in his death that his principles stood the test of practical application, he had invented a method having for its end the rectification of opinion, and, above all, he had asserted "the autonomy of the individual intellect." **Socratic schools.** Accordingly, not one school but several schools sprang up amongst his associates, those of them who had a turn for speculation taking severally from his teaching so much as their pre-existing tendencies and convictions allowed them to assimilate. Thus Aristippus of Cyrene interpreted hedonistically the theoretical morality, Antisthenes the Cynic copied and caricatured the austere example, Euclides of Megara practised and perverted the elenctic method, Plato the Academic, accepting the whole of the Socratic teaching, first developed it harmoniously in the sceptical spirit of its author, and, afterwards conceiving that he had found in Socrates's agnosticism the germ of a philosophy, proceeded to construct a system which should embrace at once ontology, physics, and ethics. From the four schools thus established sprang subsequently four other schools,—the Epicureans being the natural successors of the Cyrenaics, the Stoics of the Cynics, the Sceptics of the Megarians, and the Peripatetics of the Academy. In this way the teaching of Socrates made itself felt throughout the whole of the post-Socratic philosophy. Of the influence which he exercised upon Aristippus, Antisthenes, and Euclides, the "incomplete Socratics," as they are commonly called, as well as upon the "complete Socratic" Plato, something must now be said.

Incomplete Socratics. The "incomplete Socratics" were, like Socrates, sceptics; but, whereas Aristippus, who seems to have been in contact with Protagoreanism before he made acquaintance with Socrates, came to scepticism, as Protagoras had done, from the standpoint of the pluralists, Antisthenes, like his former master Gorgias, and Euclides, in whom the ancients rightly saw a successor of Zeno, came to scepticism from the standpoint of Eleatic monism. In other words, Aristippus was sceptical because, taking into account the subjective element in sensation, he found himself compelled to regard what are called "things" as successions of feelings, which feelings are themselves absolutely distinct from one another; while Antisthenes and Euclides were sceptical because, like Zeno, they did not understand how the same thing could at the same moment bear various and inconsistent epithets, and consequently conceived all predication which was not identical to be illegitimate. Thus Aristippus recognized only feelings, denying things; Antisthenes recognized things, denying attributions; and it is probable that in this matter Euclides was at one with him. For, though since Schleiermacher many historians, unnecessarily identifying the εἰδῶν φίλοι of Plato's *Sophist* with the Megarians, have ascribed to Euclides a theory of "ideas," and on the strength of this single passage thus conjecturally interpreted have added a new chapter to the history of Megarianism, it is difficult, if not impossible, to see how, if the founder of the school had broken loose from the trammels of the Zenonian paradox, his successors, and amongst them Stilpo, should have reconciled themselves, as they certainly did, to the Cynic denial of predication.

While the "incomplete Socratics" made no attempt to overpass the limits which Socrates had imposed upon himself, within those limits they occupied each his department. Aristippus, a citizen of the world, drawn to Athens by the fame of Socrates, and retained there by the sincere affection which he conceived for him, interpreted the ethical doctrine of Socrates in accordance with his own theory of pleasure, which in its turn came under the refining influence of Socrates's theory of φρόνησις. Contrariwise, Antisthenes, a rugged but not ungenerous nature, a hater of pleasure, troubled himself little about ethical theory and gave his life to the imitation of his master's asceticism. Virtue, he held, depended upon "works," not upon arguments or lessons; all that was necessary to it was the strength of a Socrates (Diog. Laert., vi. 11). Yet here too the Socratic theory of φρόνησις had a qualifying effect; so that Cyrenaic hedonism and Cynic asceticism sometimes exhibit unexpected approximations. The teaching of Euclides, though the Good is still supposed to be the highest object of knowledge, can hardly be said to have an ethical element; and in consequence of this deficiency the dialectic of Socrates degenerated in Megarian hands, first into a series of exercises in fallacies, secondly into a vulgar and futile eristic. In fact, the partial Socraticisms of the incomplete Socratics necessarily suffered, even within their own narrow limits, by the dismemberment which the system had undergone. Apparently the maieutic theory of education was not valued by any of the three; and, however this may be, they deviated from Socratic tradition so far as to establish schools, and, as it would seem, to take fees like the professional educators called Sophists.

Plato's physical theories. Of the relations in which the metaphysic of Plato stood to the Socratic search for definitions there are of necessity almost as many theories as there are interpretations of the Platonic system. Hence in this place the writer must content himself with a summary statement of his own views. Initiated into philosophical speculation by the Heraclitean Cratylus, Plato began his intellectual life as an absolute sceptic, the followers of Heraclitus having towards the end of the 5th century pushed to its conclusion the unconscious scepticism of their master. There would have been then nothing to provoke surprise, if, leaving speculation, Plato had given himself to politics. In 407, however, he became acquainted with Socrates, who gave to his thoughts a new direction. Plato now found an occupation for his intellectual energies, as Socrates had done, in the scrutiny of his beliefs and the systematization of his principles of action. But it was not until the catastrophe of 399 that Plato gave himself to his life's work. An exile, cut off from political ambitions, he came forward as the author of dialogues

which aimed at producing upon readers the same effect which the voice of the master had produced upon hearers. For a time he was content thus to follow in the steps of Socrates, and of this period we have records in those dialogues which are commonly designated Socratic. But Plato had too decided a bent for metaphysics to linger long over propædeutic studies. Craving knowledge—not merely provisional and subjective knowledge of ethical concepts, such as that which had satisfied Socrates, but knowledge of the causes and laws of the universe, such as that which the physicists had sought—he asked himself what was necessary that the "right opinion" which Socrates had obtained by abstraction from particular instances might be converted into "knowledge" properly so called. In this way Plato was led to assume for every Socratic universal a corresponding unity, eternal, immutable, suprasensual, to be the cause of those particulars which are called by the common name. On this assumption the Socratic definition or statement of the "what" of the universal, being obtained by the inspection of particulars, in some sort represented the unity, form, or "idea" from which they derived their characteristics, and in so far was valuable; but, inasmuch as the inspection of the particulars was partial and imperfect, the Socratic definition was only a partial and imperfect representation of the eternal, immutable, suprasensual idea. How, then, was the imperfect representation of the idea to be converted into a perfect representation? To this question Plato's answer was vague and tentative. By constant revision of the provisional definitions which imperfectly represented the ideas he hoped to bring them into such shapes that they should culminate in the definition of the supreme principle, the Good, from which the ideas themselves derive their being. If in this way we could pass from uncertified general notions, reflections of ideas, to the Good, so as to be able to say, not only that the Good causes the ideas to be what they are, but also that the Good causes the ideas to be what we conceive them, we might infer, he thought, that our definitions, hitherto provisional, are adequate representations of real existences. But the Platonism of this period had another ingredient. It has been seen that the Eleatic Zeno had rested his denial of plurality upon certain supposed difficulties of predication, and that they continued to perplex Antisthenes as well as perhaps Euclides and others of Plato's contemporaries. These difficulties must be disposed of if the new philosophy was to hold its ground, and accordingly, to the fundamental assertion of the existence of eternal immutable ideas, the objects of knowledge, Plato added two subordinate propositions, namely, (1) "the idea is immanent in the particular," and (2) "there is an idea wherever a plurality of particulars is called by the same name." Of these propositions the one was intended to explain the attribution of various and even inconsistent epithets to the same particular at the same time, whilst the other was necessary to make this explanation available in the case of common terms other than the Socratic universals. Such was the Platonism of the *Republic* and the *Phædo*, a provisional ontology, with a scheme of scientific research, which, as Plato honestly confessed, was no more than an unrealized aspiration. It was the non-Socratic element which made the weakness of this the earlier theory of ideas. Plato soon saw that the hypothesis of the idea's immanence in particulars entailed the sacrifice of its unity, whilst as a theory of predication that hypothesis was insufficient, because applicable to particulars only, not to the ideas themselves. But with clearer views about relations and negations the paradox of Zeno ceased to perplex, and with the consequent withdrawal of the two supplementary articles the development of the fundamental assumption of ideas, eternal, immutable, suprasensual, might be attempted afresh. In the more definite theory which Plato now propounded the idea was no longer a Socratic universal, perfected and hypostatized, but rather the perfect type of a natural kind, to which type its imperfect members were related by imitation, whilst this relation was metaphysically explained by means of a "thoroughgoing idealism" (R. D. Archer-Hind). Thus, whereas in the earlier theory of ideas the ethical universals of Socrates had been held to have a first claim to hypostatization in the world of ideas, they are now peremptorily excluded, whilst the idealism which reconciles plurality and unity gives an entirely new significance to so much of the Socratic element as is still retained.

Plato's ethical theories

The growth of the metaphysical system necessarily influenced Plato's ethical doctrines; but here his final position is less remote from that of Socrates. Content in the purely Socratic period to elaborate and to record ethical definitions such as Socrates himself might have propounded, as soon as the theory of ideas offered itself to Plato's imagination he looked to it for the foundation of ethics as of all other sciences. Though in the earlier ages both of the individual and of the state a sound utilitarian morality of the Socratic sort was useful, nay valuable, the morality of the future should, he thought, rest upon the knowledge of the Good. Such is the teaching of the *Republic*. But with the revision of the metaphysical system came a complete change in the view which Plato took of ethics and its prospects. Whilst in the previous period it had ranked as the first of sciences, it was now no longer a science; because, though Good absolute still occupied the first place, Good relative and all its various forms—justice, temperance, courage, wisdom—not being ideas, were incapable of being "known." Hence it is that the ethical teaching of the later dialogues bears an intelligible, though perhaps unexpected, resemblance to the simple practical teaching of the unphilosophical Socrates.

Yet throughout these revolutions of doctrine Plato was ever true to the Socratic theory of education. His manner indeed changed; for, whereas in the earlier dialogues the characteristics of the master—

> "The soft and intricate discourse,
> The wit that makes us tolerant perforce,
> The mystic legend, and the verse that drops
> As snowflakes shower on wintry forest tops,
> The questions working wedge-like to the proof,
> The threads of prayer from old religion's woof,
> The courteous skill of keen rebukes that chide
> The learner's folly and the sophist's pride"—

are studiously and skilfully preserved, in the later dialogues Socrates first becomes metaphysical, then ceases to be protagonist, and at last disappears from the scene. But in the later dialogues, as in the earlier, Plato's aim is the aim which Socrates in his conversation never lost sight of, namely, the dialectical improvement of the learner.

Bibliography. Of the histories of Greek philosophy enumerated in the article PARMENIDES the most important for the study of Socrates's life and work is Zeller's *Philosophie d. Griechen*. The part in question has been translated into English under the title of *Socrates and the Socratic Schools*, London, 1877. Schwegler's *Geschichte d. griechischen Philosophie* will also be found instructive. It is plainly impossible to supply here such a list of special treatises as is given by Ueberweg in his *Grundriss d. Geschichte d. Philosophie*, and still more so to provide a complete bibliography. But the following sources of information may be mentioned:—F. Schleiermacher, "Ueber d. Werth d. Sokrates als Philosophen," in *Abh. d. Berliner Akad. d. Wissensch.*, 1818, and *Werke*, iii., 2, 287-308, translated into English by C. Thirlwall, in the *Philosophical Museum*, Cambridge, 1833, ii. 538-555; L. F. Lelut, *Du Demon de Socrate*, Paris, 1836, 1856, reviewed by E. Littre in *Medecine et Médecins*, Paris, 1872; G. Grote, *History of Greece*, ch. lxviii., and *Plato and the other Companions of Sokrates*, London, 1865; C. F. Hermann, *De Socratis accusatoribus*, Gottingen, 1854; W. H. Thompson, *The Phædrus of Plato*, London, 1868, Appendix I.; T. Wildauer, *D. Psychologie d. Willens bei Sokrates*, &c., Innsbruck, 1877. For the view taken in the present article with regard to the δαιμόνιον, see the writer's paper "On the δαιμόνιον of Socrates," in the *Journal of Philology*, v., and comp. Chr. Meiners, *Vermischte philosophische Schriften*, Leipsic, 1776—"in moments of 'Schwärmerei' Socrates took for the voice of an attendant genius what was in reality an instantaneous presentiment in regard to the issue of a contemplated act." For a fuller statement of the writer's view of Plato's relations to Socrates, see a paper on Plato's *Republic*, vi. 509 D sq., in the *Journal of Philology*, x., and a series of papers on "Plato's later Theory of Ideas," in vols. x., xi., xiii., xiv. of the same periodical. Comp. SOPHISTS and (by all means) ETHICS. (H. JA.)

SOCRATES, church historian. In the course of the last twenty-five years (425-450) of the reign of Theodosius II (the first thoroughly Byzantine emperor) at least six church histories were written in Greek within the limits of the Eastern empire,—those, namely, of Philostorgius the Arian, of Philippus Sidetes, of Socrates, of Sozomen, of Theodoret, and of Hesychius. Of these the first, no longer extant except in fragments, seems to have been the most important. Those of Philip and of Hesychius (the former an untrustworthy and dreary performance) have also perished. The remaining three are now our main sources for church history from Constantine to Theodosius II. None of them has ventured upon a fresh treatment of the period dealt with by Eusebius; all three begin their narratives about the point where his closes. In the West the *Church History* of that author had already been continued by Rufinus and his *Chronicle* by Jerome, and the work of Rufinus was certainly known to the Byzantines. Nor did these write independently of each other, for SOZOMEN (*q.v.*) certainly had before him the work of Socrates, and THEODORET (*q.v.*) knew one or both of them. The three histories together became known in the West from the 6th century through the selection which Cassiodorus caused to be made from them, and it is to this selection (if we leave Rufinus and Jerome out of account) that the Middle Ages were mainly indebted for all they knew of the Arian controversies, and of the period generally between the councils of Nice and Ephesus.

The Ἐκκλησιαστικὴ Ἱστορία of Socrates, still complete, in several books, embracing the period from 306 to 439, was written about, or at all events not later than, 440. He was born and brought up at Constantinople; the date of his birth is uncertain, but it can hardly have been before 385. Of the facts of his life we know practically nothing, except that he was not a cleric but a "scholasticus" or advocate. Of the occasion, plan, and object of

his work he has himself infoimed us in the prologues to his first, second, fifth, and sixth books It is dedicated to one Theodorus, who had urged him to write such a history He had no thorough preparation for the task, and for the period down to the death of Constantius (361) was practically dependent on Rufinus His work finished, he became a student of Athanasius and came to see how untrustworthy his guide had been He accordingly rewrote his first two books, and it is only this revision that has reached us The chief sources from which he drew were—(1) the *Chuich Histoiy*, the *Life of Constantine*, and the theological works of Eusebius, (2) the *Chuich Histoiy* of Rufinus, (3) the works of Athanasius, (4) the no longer extant Συναγωγὴ τῶν Συνοδικῶν of the Macedonian and semi-Arian Sabinus,—a collection with commentaries of acts of councils, brought down to the reign of Theodosius I (this was a main source), (5) collections of letters by members of the Arian and orthodox parties, (6) the *Ancoiatus* of Epiphanius, (7) works of Archelaus, Gregory of Laodicea, Evagrius, Palladius, orations of Nestorius, &c Theological literature proper—as, for example, the writings of the Cappadocians—he quite neglected On the other hand, he appears to have known some of Origen's work, and the *Apologia pio Oiigene* of Pamphilus It is to Origen and Origen's immediate disciples that he refers when he speaks of "the old church wiiters," or of "the Christian philosophers", the last designation, however, also includes the monks Jeep alleges, but does not adduce any adequate proof, that Socrates made use of Philostorgius As regards profane history his materials were exceedingly defective Thus, for example, he confesses his reason for not relating the political history of Constantine to be that he has been unable to ascertain anything about it Jeep has instituted an examination into the *fasti*, containing historical notes, made use of by our author with the following results His chronological data with the facts he appends to them are of the highest value, especially in those cases where, as sometimes happens, data are preseived which are less precisely given in othei fasti and chronicles Somewhere about the year 395-400 his use of these precisely dated records of profane history comes to an end From this point his information is purely ecclesiastical (dates of ordination and death of bishops and the like), that is to say, he makes use of church fasti The secular fasti of Socrates come down precisely to the same point as those which lay in the first rank before Idatius [1] His reckonings by Olympiads are generally wrong, the error arising not from any systematic souice but merely from carelessness It is not altogether impossible, however, after all that Socrates may have taken the historical data of his fasti at second hand from the profane historians He certainly made use of Eutropius, but that he had any recourse to Eunapius and Olympiodoius is more doubtful, and indeed would be quite improbable if it could be proved that he had Philostorgius before him There is no evidence of his having known the works of Dexippus and Zosimus But he is gieatly indebted to oral tradition and to the testimony of eyewitnesses, especially of members of the Novatian community in Constantinople, something also he has set down from personal knowledge The contents of the closing books are for the most part derived fiom oral tradition, from the narratives of friends and countrymen, fiom what was still generally known and cuiient in the capital about past events, and from the ephemeral literature of the day

The theological position of Sociates, so fai as he can be said to have had one, is at once disclosed in his unlimited admiration for Origen All the enemies of the gieat Alexandiian he iegaids meiely as empty and vain obscuiantists, for the oithodoxy of his hero he appeals to Athanasius Closely connected with his high iegaid for Origen aie his appieciation of science geneially and the modeiation of his judgment on all dogmatic questions Accoiding to him, ελληνική παιδεία is quite indispensable within the chuich, many Gieek philosopheis weie not fai fiom the knowledge of God, as is pioved by theii tiiumphant aiguments against atheists and gainsayeis of divine piovidence The apostles did not set themselves against the study of Gieek liteiatuie and science, Paul had even made a thoiough study of them himself The Sciiptuies, it is true, contain all that appeitains to faith and life, but give no clue to the ait of confuting gainsayeis Greek science, theiefoie, must not be banished fiom the chuich, and the tendency within the church so to deal with it is wiong This point of view was the common one of the majoiity of educated Chiistians at that period, and is not to be iegaided as exceptionally libeial The same holds tiue of the position of Sociates in iegard to dogmatic questions On the one hand, indeed, oithodoxy and heresy aie symbolized to his mind by the wheat and the taies respectively, he clings to the naive opinion of Catholicism, that contempoiaiy orthodoxy has pievailed within the church from the fiist, he iecognizes the tiue faith only in the mystery of the Tiinity, he judges heretics who have been already condemned as inteilopers, as impudent innovators, actuated by bad and self seeking motives, he apologizes for having so much as tieated of Arianism at all in his histoiy of the chuich, he believes in the inspiration of the ecclesiastical councils as much as in that of the Sciiptures themselves But, on the othei hand, he takes absolutely no inteiest in dogmatical subtleties and clerical disputes, he regards them as the souice of great evils, and expiesses his ciaving foi peace "one ought to adore the ineffable mysteiy in silence" This attitude, which was that of most educated Byzantine laymen, has in paiticulai cases made it possible foi him to aiiive at veiy free judgments Even giantıng that some feeble remains of antique reseive may have contiibuted to this, and even although some of it is ceitainly to be set down to his disposition and tempeiament, still it was his religious passivity that here determined the charactei of Socrates and made him a typical example of the latei Byzantine Christianity If Sociates had lived about the yeai 325, he certainly would not have ianked himself on the side of Athanasius, but would have joined the party of mediation But—the ομοούσιος has been laid down, and must be iecognized as coiiectly expressing the mysteiy, only one ought to iest satisfied with that woid and with the iepudiation of Arianism Anything moie, eveiy new distinction, is mischievous The contioveisy in its details is a νυκτομαχία to him, full of misundeistandings Sometimes he gives piominence, and coirectly, to the fact that the disputants paitially failed to undeistand one anothei, because they had sepaiate interests at heait,—those on the one side desiring above eveiything to guaid against polytheism, those on the other being most afiaid of Sabellianism He did not fail, however, to iecognize also that the controveisies fiequently had their ioot in meie emulation, slander, and sophistiy Not unfiequently he passes veiy sharp judgments on whole groups of bishops In the pieface to his fifth book he excuses his tienching on the region of political histoiy on the giound of his desire to spaie his readeis the disgust which peiusal of the endless disputes of the bishops could not fail to excite, and in that to his sixth book he prides himself on nevei having flatteied even the orthodox bishops This attitude of his has given him a ceitain measuie of impaitiality Constantius, and even Julian—not Valens, it is true—aie estimated very faiily The Aiian Goths who died for their ieligion are recognized as genuine martyis His characteiizations of Cyril and Nestoiius, and his naiiative and criticism of the beginnings of the Chiistological controveisy, aie models of candoui and histoiical conscientiousness In fiequent instances, moreovei, he acknowledges his own incompetency to give an opinion and hands the question over to the cleigy Foi the cleigy as a whole, in spite of his ciiticism of individuals, he has the veiy highest respect, as also foi the monks, without himself making any inoidinate ieligious piofessions In a special excuisus of consideiable length he has paid a tribute of the highest oider to monachism, and in his chaiacterization of Theodosius II also (where he has made use of the biightest colouis) he does not fail to point out that in piety the empeior could almost compete with the monks But, apart fiom these two chapteis (iv 23, vii 22), it is but seldom that one could leain fiom the pages of Sociates that there was such a thing as monasticism in those days To his mind the convent is not far iemoved from the chuich, and as a layman he is not at all inclined to accept the piinciples of monachism as applying to himself or to squaie his views of history in accoidance with them He has even gone so far as foimally to expiess his sympathy with Paphnutius, the champion of the iight of bishops to maiiy

As a souice foi the peiiod within which he wiote, the woik of Sociates is of the gieatest value, but as "history" it disappoints even the most modest expectations Eusebius, after all, had some conception of what is meant by "church histoiy," but Sociates has none "As long as theie is peace theie is no mateiial for a histoiy of the chuich", but, on the other hand, neither do heiesies by rights

[1] See Holder-Egger, *Neues Archiv f deutsche Gesch*, ii 61

come into the story. What, then, is left for it? A collection of anecdotes and a series of episodes. In point of fact this is the view actually taken by Socrates. His utter want of care and consistency appears most clearly in his vacillation as to the relations between ecclesiastical and political history. At one time he brings in politics, at another he excuses himself from doing so. He has not failed to observe that church and state act and react upon each other; but he has no notion how the relation ought to be conceived. Nevertheless his whole narrative follows the thread of political—that is to say, of imperial—history. This indeed is characteristic of his Byzantine Christian point of view; church history becomes metamorphosed into a history of the emperors and of the state, because a special church history is at bottom impossible. But even so one hardly hears anything about state or court except great enterprises and anecdotes. Political insight is wholly wanting to Socrates; all the orthodox emperors blaze forth in a uniform light of dazzling splendour; even the miserable Arcadius is praised, and Theodosius II. figures as a saint whose exemplary piety turned the capital into a church. If in addition to all this we bear in mind that in his later books the historian's horizon is confined to the city and patriarchate of Constantinople, that he was exceedingly ill informed on all that related to Rome and the West, that in order to fill out his pages he has introduced narratives of the most unimportant description, that in not a few instances he has evinced his credulity (although when compared with the majority of his contemporaries he is still entitled to be called critical), it becomes sufficiently clear that his *History*, viewed as a whole and as a literary production, can at best take only a secondary place. One great excellence, however, cannot be denied him, his honest and sincere desire to be impartial. He tried also, as far as he could, to distinguish between the certain, the probable, the doubtful, and the untrue. He made no pretence to be a searcher of hearts and frequently declines to analyse motives. He has made frank confession of his nescience, and in certain passages his critical judgment and sober sense and circumspection are quite striking. He writes a plain and unadorned style and shuns superfluous words. Occasionally even there are touches of good humour and of trenchant satire,—always the sign of an honest writer. In short, the rule to be applied in the criticism of Socrates is that his learning and knowledge can be trusted only a little but his good will and straightforwardness a great deal. Considering the circumstances under which he wrote and the miseries of the time, it can only be matter for congratulation that such a man should have become our informant and that his work has been preserved to us.

Finally, it is to be noted that Socrates was either himself originally a Novatianist who had afterwards joined the Catholic Church, or that whether through his ancestors or by education he had stood in most intimate relations with the Novatianist Church. In his *History* he betrays great sympathy with that body, has gone with exactness into its history in Constantinople and Phrygia, and is indebted for much of the material of his work to Novatianist tradition and to his intercourse with prominent members of the sect. Both directly and indirectly he has declared that Novatianists and Catholics are brothers, that as such they ought to seek the closest relations with one another, and that the former ought to enjoy all the privileges of the latter. His efforts, however, had only this result, that he himself afterwards fell under suspicion of Novatianism. For bibliography, see SOZOMEN. (A. HA.)

SODIUM AND SODA. Sodium is one of the two principal alkali metals, regarding the general properties of which the reader is referred to CHEMISTRY (vol. v. p. 521) and the introductory portion of POTASSIUM (vol. xix. p. 588). In combination sodium is a generally diffused and most abundant element. The salt dissolved in sea water consists chiefly of chloride of sodium (NaCl), and according to Dittmar's calculation (see SEA WATER) the oceans of the world contain of sodium calculated as chloride not less than $36,000 \times 10^{12}$ (*i.e.*, 36,000 million million) tons, whilst of potassium calculated as sulphate the amount in sea water is 1141×10^{12} (1141 million million) tons. From sea water have been deposited the enormous beds of rock salt found in many parts of the world (see SALT). Sodium carbonates are also widely dispersed in nature, forming constituents of many mineral waters, and occurring as principal saline components in natron or trona lakes, as efflorescences in Lower Egypt, Persia, and China, and as urao in Mexico, Colombia, and Venezuela. The solid crusts found at the bottom of the salt lakes of the Araxes plain in Armenia contain about 16 per cent. of carbonate and 80 of sulphate of soda. In New Granada there occurs a double salt, $Na_2CO_3 + CaCO_3 + 5H_2O$, known as gay-lussite. In Wyoming, California, and Nevada enormous deposits of carbonates, mixed in some cases with sulphate and with chloride, occur. About Szegedin in Hungary and all over the vast pusztas (steppes) between the Theiss and the Danube, and from the Theiss up to and beyond Debreczin, the soil contains sodium carbonate, which frequently assumes the form of crude alkaline crusts, called "szekso," and of small saline ponds. A purified specimen of such Debreczin soda was found to contain as much as 90 per cent. of real carbonate ($NaCO_3$) and 4 of common salt. Natural sulphate occurs in an anhydrous condition as thenardite (Na_2SO_4) at Tarapaca, Peru, and in the rock-salt deposits at Espartinas near Aranjuez, Spain. Hydrated sulphates occur at several localities in the province of Madrid and in other provinces of Spain, and at Muhlingen in Aargau, and copious deposits of glauberite, the double sulphate of sodium and calcium, are met with in the salt-mines of Villarrubia in Spain, at Stassfurt, and in the province of Tarapaca, Peru, &c. A native nitrate of soda is obtained in great abundance in the district of Atacama and the province of Tarapaca, and is imported into Europe in enormous quantities as cubical nitre for the preparation of saltpetre (see NITROGEN, vol. xvii. p. 518). Cryolite, a fluoride of aluminium and sodium, $AlF_3 + 3NaF$, is extensively mined in Greenland for industrial purposes. These form the principal natural sources of sodium compounds,—the chloride as rock salt and in sea water being of such predominating importance as quite to outweigh all the others. But it is questionable whether taken altogether the mass of sodium they represent is as much as that disseminated throughout the rocky crust in the form of soda felspar (*i.e.*, as silicate of soda) and in other soda-containing rocks. From this source all soils contain small proportions of sodium in soluble forms, hence the ashes of plants, although they preferably imbibe potassium salts, contain traces and sometimes notable quantities of sodium salts. Sodium salts also form essential ingredients in all animal juices.

Considered industrially, by far the most important bodies are the carbonates, the sulphates, and caustic soda (sodium hydrate), the manufacture of which forms the basis of the soda industry. Immense quantities of these bodies are used in the manufacture of soap and glass, and under the name of "washing soda" or "soda crystals" the consumption of the hydrated carbonate for domestic washing is also very great. There are indeed few chemical industries in which soda in one form or another does not play an important part, and the combinations of economic value into which it enters are numberless. It will be convenient to treat of the manufacture as a whole by itself, after speaking of sodium and its salts in their chemical relations.

Sodium, in German *Natrium* (symbol, Na; atomic weight, 23·053; O = 16), is a univalent metal. It occurs nowhere in nature in an uncombined condition, and was first isolated in 1807 by Sir Humphrey Davy through the medium of voltaic electricity. It is prepared by distillation of an intimate mixture of carbonate of soda with charcoal. The process is quite analogous to that followed in making metallic potassium (POTASSIUM, vol. xix. p. 590), but much easier of execution, and free from certain dangers which attend the preparation of the other. The distillation is conducted in cylindrical iron retorts protected against the fire by means of fireclay tubes fitting closely round them. In the charge is included a certain proportion of chalk, which, giving off carbonic acid, aids in driving over the metallic vapour and protects the distillate against oxidation. The metal cast into the form of cakes or ingots is protected from the air by a coating of paraffin and secured in closely fitting soldered-up tinned-iron boxes. Metallic sodium is very similar in properties and appearance to potassium. The principal points of difference are its pure white colour,

its specific gravity (0 9735 at 13° 5 C), and its fusing point (95° 6 C) In thin layers its vapour is colourless, but dense fumes have a purple tint It decomposes water violently, but the hydrogen evolved does not take fire, although the reaction is more dangerous than the corresponding phenomena developed by potassium, because it leads frequently to most violent explosions Yet the process serves in practice for the preparation of pure soda hydrate In this operation a piece of sodium is placed in a silver basin standing in a shallow cold-water bath Drop by drop water is added—the metal between the additions being allowed to expend its energy—till the desired quantity of hydrate is formed The process, in short, is so conducted that, except at first, the metal never touches water in any other form than that of a strong soda lye Sodium is largely made for use as an agent in the manufacture of aluminium and magnesium, and as a reagent in laboratory operations The metal does not affect carbonic oxide at any temperature, it acts on hydrogen as potassium does, but the compound is less stable On ammonia gas it acts, as in the parallel case of potassium, with the formation of NH_2Na, only the reaction is less energetic Sodium has less powerful affinity to oxygen than potassium, in dry air or oxygen it burns into the dioxide Na_2O_2,—a product obtainable also by heating the nitrate or nitrite A white solid soluble in cold water, forming a hydrate, $Na_2O_2 + 8H_2O$, is obtainable in crystals, the solution of which is strongly alkaline With acids it yields sodium salts and peroxide of hydrogen Sodium tetroxide (Na_2O_4) is not known to exist

Caustic Soda (NaHO) is prepared from carbonate by means of caustic lime, just as caustic potash is made from its carbonate (see POTASSIUM) The analogy between the two caustic alkalis is so perfect that we need only summarize the points of difference between them Compared with caustic potash, caustic soda is less easily soluble in water, less caustic, less energetically basilous, less prone when fused in air to pass into peroxide, hence less destructive to platinum, iron, nickel, and silver vessels

Sodium Chloride (NaCl) occurs in nature in a nearly pure state Absolutely pure salt is made from commercial salt by precipitating from a solution the lime and magnesia by pure carbonate of soda, filtering, neutralizing with pure hydrochloric acid, concentrating by evaporation, and then precipitating the pure salt by a stream of hydrochloric acid gas The crystalline precipitate is collected over glass wool, washed with pure fuming hydrochloric acid, and dried by heating in a platinum basin It forms non-hygroscopic crystals, free from combined water, having a specific gravity at 16° C of 2 162 (Stolba), and according to Carnelley fusing at 776° C The solubility of pure salt in water is almost independent of temperature, 100 parts of water dissolve—

at 0°	14°	60°	100°	109° 7 (boiling)	
35 52	35 87	37 25	39 61	40 53	parts of NaCl

Regarding its commercial relations, &c, see SALT

Chlorate of Soda ($NaClO_3$) is a salt of some industrial importance, from its use in the manufacture of aniline black It may be made from the potash salt (*a*) by decomposing this with hydrofluosilicic acid (which precipitates the potassium as fluosilicate and yields a solution of chloric acid), and neutralizing the chloric acid solution with soda, or (*b*) by double decomposition with bitartrate of soda, $NaHC_4H_4O_6$,—the cream of tartar ($KHC_4H_4O_6$) separating out almost completely, whilst the chlorate of soda remains in solution According to Weldon, it is best manufactured from caustic soda by the direct action of chlorine, the two salts NaCl and $NaClO_3$ being separated by crystallization Chlorate of soda forms cubes which often exhibit tetrahedral faces, 100 parts of water dissolve at 0° 81 9, at 20° 99, and at 100° C 233 parts of the salt Hence it is much more soluble than the potash salt, on which account it is preferred for aniline black printing

Sulphate (Na_2SO_4) is the most largely produced of all soda salts in manufacturing operations, although it is regarded principally as an intermediate product The anhydrous salt readily combines with water into a crystalline soluble compound, $Na_2SO_4 + 10H_2O$, known as Glauber's salt This forms large transparent monoclinic crystals, and is characteristically prone to form supersaturated solutions 100 parts of water dissolve—

at 0°	11° 67	25° 05	32° 73	33° 88	
12 17	26 38	99 48	322 1	312 1	parts of $Na_2SO_4 + 10\ H_2O$,
5 02	10 12	28 11	50 65	50 4	parts of $NaSO_4$

As the temperature rises beyond about 33°, the solubility decreases (Gay-Lussac) Glauber's salt, when exposed to dry air, especially in summer heat, gradually falls into a powder of anhydrous sulphate It is much less volatile than the chloride The thiosulphate, $Na_2S_2O_3$ (commercial hyposulphite of soda), and soda salts of other lower sulphur acids, are reserved for SULPHUR

Of all sodium compounds, except common salt, the carbonates are by far the most important, both industrially and chemically These comprise the following

Normal Carbonate, Na_2CO_3 —The anhydrous salt usually presents itself in the form of a white opaque porous solid, specific gravity 2 65 (Karsten) According to Carnelley, it fuses at 818° C (dull red heat) into a colourless liquid On fusing it loses some of its carbonic acid, and at a bright red heat it volatilizes appreciably The porous salt absorbs water from the air, when moistened with water it gives off heat and unites into crystalline hydrates, of which the important compound is

Decahydrate, $Na_2CO_3 + 10H_2O$ —This salt, known as soda crystals or washing soda, forms large transparent monoclinic rhomboidal prisms or double pyramids The salt dissolves readily in water, forming strongly alkaline solutions, which emulsionize fats, though less readily than is done by caustic lyes 100 parts of water dissolve—

at 0°	15°	20	30°	38°	104	
21 33	63 20	92 82	273 6	1142 2	539 6	of crystals,
6 97	16 20	21 71	37 24	51 67	46 47	of Na_2CO_3

(Lowel) According to this observer, the dissolved salt from 38° C upwards assumes the form of lower hydrates, hence the diminution in solubility at higher temperatures A saturated solution, when evaporated down by heat, deposits a granular salt of the composition $Na_2CO_3(H_2O$ or $2H_2O)$ The decahydrate, when exposed to dry air even at ordinary temperatures, loses water, with the formation of monohydrate, $Na_2CO_3H_2O$ It also readily takes up carbonic acid with the formation of

Bicarbonate, $NaHCO_3$ —Its formation may be thus formulated —$Na_2CO_3 + 10H_2O + CO_2 = 2NaHCO_3 + 9H_2O$ The bicarbonate remains as a crystalline mass, while the liberated water runs off with more or less of dissolved carbonate and the saline impurities which may be present Bicarbonate forms small four-sided monoclinic plates with a feebly alkaline taste and reaction 100 parts of water dissolve—

at 0°	20°	40°	60°	
6 90	9 60	12 70	16 40	of $NaHCO_3$

(Dibbits) From about 70° C upwards the solution gives off carbonic acid with formation of *Sesquicarbonate*,—$2Na_2O + 3CO_2 + 4H_2O = Na_2CO_32NaHCO_3 + 3H_2O$ This salt, found in nature as trona or urao, forms in its pure state crystals which do not lose water in the air At 20° C 100 parts of water dissolve 18 3 parts of the salt calculated as anhydride, $2Na_2O3CO_2$ Both bicarbonate and sesquicarbonate when heated dry break up readily (below redness) into normal carbonate, water, and carbonic acid

Other salts of soda which are of importance on account of their acid constituents—nitrate, silicate, phosphate—are dealt with under NITROGEN, SILICA, PHOSPHORUS.

The estimation and analysis of alkalis are sufficiently dealt with at the close of the article POTASSIUM.

Soda Manufacture.

The ancients probably did not know soda in other than its native forms, and till about the end of the 18th century potash was, of the two alkalis, the more abundant and generally used substance. In deed it was not till well into that century that the chemical distinctions of the alkalis were established; they were previously spoken of indifferently as nitrum, natron, kali, alkali, and soda, names simply meaning a fixed alkali. Soda has properly a separate history only from 1736, when Duhamel established the fact that common salt and mineral alkali have the same base,—a body different from the salt of tartar or vegetable alkali. Yet soda, from both mineral and vegetable sources, had long previously been used in Europe, the Arabs having probably brought into Spain a knowledge of the alkali and its sources. Apart from the trona and soda lakes, &c., already alluded to, the only source till the close of the 18th century was the ashes of certain plants which grow on the sea-coast and in salt-impregnated soils. These plants, principally species of *Salsola* and a few other genera of the natural order *Atriplicæ*, on incineration yield an ash containing in some cases about 50 per cent. of carbonate of soda. The ash of these plants, fluxed by red heat into a pasty mass and broken into convenient lumps, forms the barilla of commerce, which in former times was a product of the first importance on the shores of Spain, Sicily, Sardinia, and other coasts of the Mediterranean. In 1834 as much as 12,000 tons of barilla were introduced into England from Spain alone, and, in spite of the cheapness of artificial soda, the manufacture of barilla is still—or at least was till recently—carried on at various localities on the Mediterranean. On the west coasts of Scotland and Ireland large amounts of impure soda carbonate were obtained from the kelp burned from certain sea weeds; but the introduction of artificial soda early extinguished that industry, although in connexion with the production of iodine and other products a small quantity of sea-weed soda continues to be made in Scotland till the present day.

The increasing price of potash salts and the discovery of Duhamel led to strenuous attempts to produce the carbonate from common salt. In 1775 the French Academy of Sciences offered a prize of 2400 livres for a practical method of converting salt into soda. But it was never awarded, although the problem was soon triumphantly solved. Indeed in that same year Scheele succeeded in making soda from common salt by means of litharge. Several claims were made for the prize, the first being based on a process invented by a Benedictine monk, Malherbe, in 1778, which was worked with some success for several years. Some time about or before 1787 De la Méthèrie proposed a plan for calcining with charcoal the sulphate prepared from chloride,—an impracticable proposal, because nearly all the resulting product is sulphide.[1] But this proposal has historical importance, because from the published account of it Le Blanc received in 1787, according to his own statement, the first suggestion of his process,—probably the most valuable and fertile chemical discovery of all times. Nicolas Le Blanc, born at Issoudun (Indre) in 1753, was private surgeon to the duke of Orleans. He was a chemist as well as a surgeon, and the prospect of the Academy prize attracted his attention to the soda problem. He added to the sulphate and charcoal mixture proposed by De la Methérie a certain proportion of chalk, and by fluxing the mixture in crucibles succeeded in effecting the desired transformation. The chemist D'Arcet and his assistant Dizé, having recognized the soundness of the process, the duke of Orleans, early in 1790, agreed to provide a capital of 200,000 francs for working the process. In September 1791 the National Assembly granted Le Blanc a patent for fifteen years, and under the superintendence of Le Blanc himself, with Dizé and Henri Shée, the steward of the duke of Orleans, a work was established at Saint Denis. But on the fall and execution of his patron Le Blanc, and all others owning and working soda processes, were ordered to resign them to the state for the public benefit, he receiving the miserable compensation of 4000 francs. In 1800 his works were reconveyed to him, but in 1806, broken in hope, health, spirit, and resource, he perished by his own hand in a workhouse.

Le Blanc's process continued to hold the field against all competing schemes till within the last few years, and that essentially in its original form. Owing to the raw materials employed in it and the products evolved, it became the basis of a series of important industries, and many interesting collateral processes have been grafted on the manufacture. Its origin was contemporaneous with the introduction of bleaching-powder (see CHLORINE, vol. v. p. 678), and the hydrochloric acid given off in the conversion of chloride into sulphate of soda became the raw material of that industry, the two processes being worked in conjunction. Since the days of Le Blanc many other methods for more directly manufacturing artificial soda have been proposed; but only one—the so-called "ammonia process"—has seriously threatened to supplant it.

Le Blanc's Process.—This consists of two stages. In the first stage common salt is converted into sulphate of soda by the action of sulphuric acid. At first acid sulphate of soda is produced thus—$2NaCl + H_2SO_4 = HCl + NaHSO_4 + NaCl$; but subsequently at a sufficient temperature the acid sulphate decomposes the remainder of the salt thus—$NaHSO_4 + NaCl = Na_2SO_4 + HCl$, so that all the chlorine is expelled as hydrochloric acid with formation of normal sulphate of soda. In the second stage the sulphate mixed with limestone and coal (charcoal in Le Blanc's original proposal) is calcined in a reducing flame, whereby a mixture of sulphide of calcium (CaS) and carbonate of soda is formed, oxygen being generally supposed to pass off as carbonic oxide, CO. According to Lunge, however, the gas produced consists chiefly of carbonic acid, so that the reaction should correspond essentially to the equation $Na_2SO_4 + 2C + CaCO_3 = Na_2CO_3 + CaS + 2CO_2$. The sulphide of calcium being practically insoluble in water and only very slowly acted on by a solution of carbonate of soda at temperatures under 45° C., the carbonate is extracted by systematic lixiviation with water at a temperature under that limit and is recovered from the solution by evaporation. If an excess of lime is used, more or less of the soda assumes the caustic form (NaHO). All crude soda-ash lyes contain some caustic alkali besides the following impurities:—chloride of sodium, sulphate of soda, sulphide of sodium combined with sulphide of iron into a soluble green compound which occasions much trouble to the manufacturer. This solution contains also occasionally cyanide or ferrocyanide of sodium, produced by the action of cyanide on the soluble form of sulphide of iron.

Salt Cake Making.—The conversion of the salt into sulphate, called "salt cake," is effected by means of sulphuric acid of about 60 per cent. (chamber acid), and may be, and still very commonly is, carried out in reverberatory furnaces having flat soles of cast iron, attached to one end of which is a pan of the same material. The waste heat from the reverberatory furnace is utilized to heat the charge placed in the pan, where the first part of the change is effected, the reaction beginning briskly with evolution of copious fumes of hydrochloric acid immediately the acid and salt are mixed. Before the Alkali Act of 1863 hydrochloric acid was freely allowed to escape through the stalk with the smoke and fire gases, carrying destruction to the vegetation of vast tracts around the works; but now all the acid is everywhere carefully collected, both because it is a source of profit and from sanitary considerations. Hence in modern "open roasters," as those reverberatory furnaces are called, the pan and the calcining sole are separated, so that the comparatively pure and undiluted fumes from the pan can be led away and collected by themselves, leaving the mixed air, fire gases, and acid fumes from the furnace hearth to be separately dealt with. In another class of furnace, called a "blind roaster," the calcination of the half finished sulphate is carried out in a muffle, so that none of the hydrochloric acid is mixed with air and fire gases. Certain advantages attend each class of furnace. In working these hand furnaces there is much unpleasant manual labour, to avoid which mechanical furnaces have been devised, in which the stirring of the charge, &c., is accomplished by machinery. The first mechanical roaster actually used was patented by Jones & Walsh in 1875. In it the whole operation from beginning to end is carried out on the sole of a large cast-iron pan heated from above. Through the roof of the chamber enclosing the pan passes a vertical shaft geared to rotate, to which are attached four horizontal arms, and to these slanting rods are fixed which terminate in scrapers. These scrapers are fixed at different lengths from the shaft centre, so that when the shaft is in motion they pass through and turn over the whole of the charge strewn over the sole of the pan. The acid is passed into the pan by a pipe from a tank situated above the roaster. The hot mixture of fire gases and acid fumes is led through a long pipe to cool down before reaching the condensers.

Hargreaves's Process for making sulphate without the direct use of sulphuric acid is based on the employment of sulphurous acid obtained by the ignition of pyrites aided by air and steam. In this way Mr Hargreaves may be said to get his sulphuric acid *ex tempore*. The process has only been elaborated as the result of a most extensive series of investigations and experiments carried out in conjunction with Mr Robinson, their first patent having been obtained in January 1870. The reaction on which the process depends may be thus formulated—$2NaCl + SO_2 + H_2O + O = Na_2SO_4 + 2HCl$. The salt used is rendered porous by first moistening it with water and then redrying it by passing it through a hot-air channel

[1] It is well established, however, that carbonate of soda can be produced in this manner. It was Liebig, we believe, who showed that the first step in the Le Blanc process is approximately thus—$2Na_2SO_4 + 6C = Na_2S_2 + Na_2CO_3 + 5CO$, only the disulphide and the carbonate on continued heating act on each other and on the carbon to form Na_2S—$Na_2S_2 + Na_2CO_3 + 2C = 2Na_2S + 3CO$.

on an endless chain of plates The salt so prepared is distributed in a range of not less than eight cast-iron cylinders, which are pervaded successively by a current of mixed superheated steam and sulphurous acid given off by pyrites The reaction begins at about 400° C and increases in energy with the rise of temperature, but it is impracticable to force the heat beyond 500° to 550°, as the charge then begins to fuse and ceases to be permeable by gases

The condensation of the hydrochloric acid given off in these processes is effected by a variety of means according to the purpose in view in securing the gas In Continental works a favourite method is to pass the gas through a range of Woulfe's bottles arranged in an ascending series,—fresh water entering the topmost and passing through the whole, till in the last and lowest, highly charged with acid, it meets the gas coming direct from the roaster After leaving the last and highest bottle the gas is generally washed thoroughly out by passing it into a small coke tower, in which it meets a downward trickle of water In English works Woulfe's bottles are not employed, and the gases are commonly conducted by a long range of piping, in which they are cooled, to one or a series of coke towers, in which they are exposed to an enormously extended condensing surface of water trickling over the coke, stones, or brick with which the interiors of the towers are filled

Black Ash Making —The conversion of the crude sulphate or salt cake into carbonate of soda, peculiarly the process of Le Blanc, is conducted in what is termed a "balling furnace" In its simplest form this consists of a long reverberatory furnace in which the fuel occupies a lower grating at one extremity of the flat sole, on which the whole reaction is carried out This sole has usually two beds, that more distant from the fire-bridge being a little higher than the front division, and on front and back beds two separate charges at different stages of advancement are treated simultaneously The salt-cake is taken as it comes from the roaster, mixed with limestone or chalk (crushed to pieces not bigger than a walnut) and with coal or anthracite in the form of slack or culm The proportions of these ingredients used in different works vary widely, but, generally stated, to each 100 parts of sulphate there are added from 100 to 140 parts of chalk or limestone and from 40 to 70 of coal These ingredients roughly mixed are passed by a hopper into the back bed of the furnace, where they become dried and heated, while a previous charge is being finished on the hot front or working bed When the charge on the working bed has been withdrawn, the mixture on the back bed is pushed forward and spread over the highly heated sole During the time it is exposed to the flames the ball-furnaceman is constantly at work with a paddle or rake turning over and exposing equally the whole charge to the action of the flame Very soon the mixture begins to soften and fuse on the surface, and by degrees the whole mass assumes a stiff pasty form Meantime bubbles of carbonic acid gas are copiously given off, the material becoming of thinner consistence, but afterwards the charge becomes again stiff, and carbonic oxide instead of carbonic acid is evolved, which as it is given off burns in long pointed flames, called "pipes" or "candles" The copious appearance of these flames indicates the completion of the operation, and the ball of black ash must now be withdrawn without delay The time required for working off a charge is from forty to fifty minutes

The manual labour of black ash balling is extremely hard and trying, while it demands for its success considerable judgment and experience On these accounts the efforts of manufacturers were early directed to the introduction of mechanical furnaces, and in 1848 W W Pattinson patented a rotating ball-furnace, which, however, owing to severe tear and wear, was unsuccessful Improvements on the revolving furnace were effected by Elliot & Russell, Stevenson & Williamson, Mactear, and others, which have rendered the working of revolvers a complete success In its general features a revolver consists of a large boiler-like cylinder of cast iron, lined internally with fire-bricks, and suspended horizontally so that it can be made to rotate about its axis One of the two open ends communicates with a furnace, which sends its flame through the cylinder From the other end the hot gases are led away for evaporating black-ash liquor The cylinder is surmounted by a platform or railway from which it receives the charge through a manhole in its side The charge is made in two separate instalments,—the whole of the chalk and two-thirds of the coal being first introduced, and the cylinder slowly rotated till a portion of the chalk has been burned to lime Then the sulphate and the remainder of the coal, well mixed, are added, the revolver going slowly at first, but more rapidly as the end approaches, the whole balling being completed in from two to two and a half hours The manhole door being opened, the revolver is turned round to allow the fluid black ash to pour out by it into a series of vessels placed beneath it Under Mactear's improved process the whole of the charge is introduced into the revolver at first, and after the decomposition is complete a small proportion of caustic lime is thrown in and quickly mixed with the charge, which is thereon at once drawn

The lixiviation of the black ash is conducted in a systematic manner so as to extract all the soda with the minimum of water The apparatus generally employed—the Buff-Dunlop system—consists of a series of at least four tanks each provided with a false bottom and two outlet pipes, and so arranged that the liquid part of the contents can be made to flow from any one of the tanks into any other The method of working consists in making fresh water meet nearly exhausted ash, and the liquid, passing on through the series of tanks and becoming gradually stronger, meets ash less and less exhausted, till in the last tank of the series the watery solution in its most concentrated state comes in contact with fresh black ash As soon as the ash in the first tank is completely exhausted the waste residue is withdrawn and a fresh charge introduced It then becomes the last of the series, number two taking the first place, and so the work goes on in regular rotation The lye obtained is allowed to clear in large tanks, from which it is drawn for evaporation

Boiling Down —The evaporation of the tank-liquor is generally effected in flat iron pans, heated from the top by the waste heat of the black ash furnaces So soon as a certain degree of concentration is passed, soda begins to separate out in the form of granular crystals These are ladled out and allowed to drain for subsequent calcination and conversion into soda ash The purity of the granular salt decreases as the evaporation proceeds, chloride and sulphate of sodium, with the sulphides of iron and sodium, separating out with the carbonate The red liquor which remains with the salt owes its colour to the iron sulphide it contains It is intensely caustic, containing much caustic soda In draining from the soda it carries off with it much of the sulphide and minor impurities from the tanks The impure soda obtained from the evaporating pans is known as black salt and consists essentially of a monohydrate, $Na_2CO_3 + H_2O$ A process for evaporation from the bottom is also worked in Lancashire and on the Continent

Carbonating —Salts that are fished out of the evaporating pan in the early stage of boiling down, being comparatively pure, require little treatment for finishing as soda ash They have simply to be dried at a moderate heat to expel the water of crystallization But with the ordinary black salt, which contains a considerable amount of both caustic soda and sodium sulphide, a special purifying and finishing treatment, called "carbonating," has to be adopted For carbonating black salt the strong lye in the evaporating tanks is mixed with sawdust and evaporated down to dryness The mixture is then introduced into a carbonating furnace, where the heat is gradually raised till the whole of the sawdust it contains is burnt off, and by the agency of the carbonic acid given off in its combustion the sulphide of sodium and the caustic soda present are converted into carbonate Mechanical carbonating furnaces have been introduced, the most successful of which is that of Mactear, in which there is a rotating circular hearth acted on by scrapers or ploughs Ordinary soda ash is at best an impure product containing always some caustic soda, which, however, considering the purposes for which it is used, can scarcely be regarded as an impurity or defect Its value is determined by analysis and is calculated from the amount of anhydrous soda (Na_2O) it contains as carbonate or hydrate

In many soda-works the black-ash process is purposely so conducted as to produce much caustic soda, and the red liquor is then worked up into caustic soda in the following manner It is first highly concentrated by boiling in a deep iron pan To the concentrated solution nitrate of soda is added, which decomposes the sulphide present with evolution of ammonia and formation of sulphate, thus $Na_2S + NaNO_3 + 2H_2O = Na_2SO_4 + NH_3 + NaHO$ The evaporation is continued till practically all the water is expelled, and the heat is forced till fusion sets in Then the remaining sulphide of sodium with the cyanide is oxidized by the nitrate, which breaks up thus—$2NaNO_3 = Na_2O + 2N + 5O$, with formation of sulphate of soda and oxide of iron Part of the carbon of the cyanogen separates as graphite (Pauli) The fused mass is allowed to stand, when the suspended matter, including, singularly, most of the alumina, settles down, leaving a perfectly clear liquid, which is run into iron drums, where it solidifies By means of this process, which has been principally elaborated by Herr Ph Pauli of Hochst near Wiesbaden, a remarkably pure product can be obtained from a very dirty liquor

Refined Alkali —Ordinary soda ash is sufficiently pure for most purposes for which the alkali is required in bulk, but for glass making, &c, it is necessary to remove all traces of iron For this purpose the ash is dissolved in water, and if a well-carbonated ash is under treatment it is merely well agitated and allowed to stand quietly till impurities settle By some manufacturers a small amount of carbonate of lime is added to the settling tank to carry down the impurities Ash containing iron salts, sulphide, and coloured impurities is treated with a small proportion of chloride of lime to oxidize the iron and cause its precipitation as hydrated ferric oxide The settled liquor is boiled down, the crystals drained, dried, and heated in a reverberatory furnace, and finally ground for the market

Soda Crystals (washing soda) are similarly prepared, by forming a strong solution of soda ash, allowing the liquor to settle, and running it into large coolers or crystallizing cones, in which the crystals form in from one to two weeks, according to the coolness of the position When the crystallization is complete the crust is

broken, the mother liquor, still holding a large amount of soda, is run off for future use, and the crystals are broken up, drained, and dried for packing and use. Soda crystals contain 63 per cent of water, and their principal employment is for domestic washing, for which their comparative non causticity well fits them.

Sulphur Recovery.—Of the several raw materials of the Le Blanc process, sulphur, now always used in the form of pyrites, is by far the most expensive. The sulphuric acid employed passes out in valueless combination as crude sulphide of calcium, and accumulates in huge mounds. Under the influence of rain sulphide of calcium in these heaps gradually assumes the forms of sulphide of hydrogen and hydrated oxide of calcium,—$CaS + 2H_2O = CaOH_2O + H_2S$. The hydrogen sulphide combines in its turn with another quantity of sulphide of calcium into CaS_2H_2, which being soluble in water runs off as yellow liquor to contaminate streams and give off sulphuretted hydrogen gas with its disgusting smell. By the action of atmospheric oxygen part of the CaS_2H_2 loses its hydrogen as water, and the remaining CaS_2 passes into thiosulphate of calcium CaS_2O_3, with simultaneous formation of polysulphides. Upon this latter tendency Mond founded his original method for recovering sulphur. He hastened the oxidation by blowing air through the moist waste till a certain proportion of the sulphide was converted into thiosulphate, and the residue into sulphhydrate CaH_2S_2, or polysulphide. The mass is lixiviated with water, the liquor decanted off, and mixed with excess of hydrochloric acid, which produces H_2S, and in general sulphur, from the sulphhydrate and sulphides of calcium, with SO_2 and sulphur from the thiosulphate. But $2H_2S + SO_2$ decompose each other into $3S + 2H_2O$. Hence it is obvious that, if the process of oxidation is stopped at the right point, the whole of the sulphur will be recovered as such. The precipitated sulphur is mixed with water placed in a closed cylinder and fused by raising the temperature of water round it in an outer casing above the melting point of sulphur. The sulphur then runs together in the lower part of the cylinder, whence it is drawn off by a pipe and cast into rolls. The Mond process, of all the many sulphur-recovery processes yet introduced, is the best; but even it no more than pays working expenses, and enables the manufacturer to end his process with an innocuous chloride of calcium ($CaCl_2$) without actual loss of money.

About 1880 considerable excitement was caused by a sulphur-recovery process patented by Schaffner and Helbig in 1878, which was expected to revolutionize the soda trade. As these hopes have not been realized, we merely state the principle of the process. The soda waste is digested with a solution of chloride of magnesium, which in the first instance leads to the formation of $CaCl_2$ and MgS. But the latter is at once decomposed, with formation of magnesia and sulphuretted hydrogen,—$MgS + 2H_2O = MgOH_2O + H_2S$. The sulphuretted hydrogen is caused to act on sulphurous acid within a solution of chloride of calcium, when the sulphur settles in a filtrable form. The liquor remaining after the expulsion of H_2S from the mixture of waste and chloride of magnesium consists of a precipitate of magnesia and a solution of chloride of calcium. By blowing carbonic acid into the mixture the following decomposition is effected—$MgO + CO_2 + CaCl_2 = CaCO_3 + MgCl_2$—so that the magnesium is recovered in its original form and the calcium of the waste obtained as carbonate, which may again be returned to the black ash roaster. This very pretty and complete process might probably have been worked out as a practical success had the conviction not arisen that even with profitable sulphur recovery the Le Blanc process will not long be able to hold its own against the ammonia process.

Ammonia Soda Process.—This process is based on the fact that bicarbonate of ammonia, when added to a strong solution of common salt, decomposes the salt with formation of a precipitate of bicarbonate of soda and a solution of ammonium chloride (sal-ammoniac), thus $NaCl + (NH_4)HCO_3 = NH_4Cl + NaHCO_3$. The ammonia is recoverable from the sal-ammoniac by distillation with lime, and, supposing no waste to occur, is usable *ad infinitum*. From bicarbonate the normal salt is easily prepared by the application of heat—$2NaHCO_3 = Na_2CO_3 + CO_2 + H_2O$. Thus by theory one-half of the carbonic acid is recovered, and, supposing the quicklime for the decomposition of the sal ammoniac to be made by heating limestone, the loss of carbonic acid is made up incidentally from that source. The only waste product which remains for disposal is the entirely innocuous chloride of calcium made in recovering ammonia by means of lime from sal ammoniac. The ammonia process was first enunciated and patented in England by Dyar & Hemming in 1838, and works on the system were established in Cheshire and some localities on the Continent, where it attracted great attention. Numerous patents, both English and Continental, followed, and many experimental works were erected, which all failed to sustain themselves in competition with the Le Blanc works. The principal difficulties to be overcome were imperfect conversion of the salt, and more especially the loss of ammonia; and it was not till 1861 that real economical success in the ammonia recovery apparatus was attained by Ernest Solvay of Couillet near Charleroi, Belgium. Works on the Solvay principle were established at Couillet in 1863; and since that date by the inventor and others, among whom ought to be mentioned Ludwig Mond, the process has been so perfected that its general adoption now appears to be only a matter of time. Already on the Continent it has practically displaced the Le Blanc process, but in the United Kingdom there is as yet only one establishment manufacturing ammonia soda.

The first essential stage in Solvay's process consists in saturating the brine with ammonia. The brine, treated with milk of lime and ammonium carbonate to precipitate magnesium and calcium salts, and of proper density, is placed in two cylindrical close iron tanks, which communicate by pipes at top and bottom with the ammonia dissolver placed between them. The ammonia dissolver is a cylindrical vessel having the same height as the tanks and provided with a perforated false bottom, down to which a tube is led through the centre of the vessel, and by this tube the ammonia gas is introduced. Coiled within the cylinder is a worm pipe, through which cold water circulates. Each brine tank is put alternately in connexion with the dissolver. Circulation from the brine tank into the dissolver is kept up by mechanical agitation. As the ammonia becomes absorbed by the brine the temperature of the liquid rises rapidly, and the cold water circulating within the coiled pipe keeps the temperature down. As soon as sufficient ammonia has been passed into the brine the stirrers in the brine tank are stopped; the sludge of lime and magnesia precipitate is drawn off as it settles at the bottom of the brine tank, or when such precipitate is abundant it is settled and withdrawn in a special decanting tank. The decanted liquor is filtered through fine cloth by pressure, and the filtrate is cooled down in a refrigerating apparatus previous to the next operation.

Treating the Ammoniacal Brine with Carbonic Acid.—For this purpose a cylindrical tower is employed, divided internally into a series of superimposed segments by diaphragms consisting of perforated dome-shaped plates. The tower is about 40 to 50 feet in height and is kept nearly full of liquid, which is introduced by a pipe half way up its side. Carbonic acid under a pressure 1.5 to 2 atmospheres is forced in at the bottom of the tower and works its way gradually upwards through the perforations in the diaphragms, thus coming into intimate contact with the ammoniacal brine. Every half hour a part of the pasty mixture of bicarbonate of soda and ammonium chloride solution is drawn off and replaced by fresh liquor. The solid bicarbonate is separated out either by centrifugal action or by a vacuum filter; as thus obtained it is still contaminated with ammonia, of which it smells. To free the bicarbonate from this impurity water is squirted over it till the smell almost entirely disappears.

Conversion into Soda Ash of the bicarbonate is essential, because there is a comparatively limited demand for bicarbonate, and that salt, moreover, obstinately retains an ammoniacal odour, which lessens its value. The preparation of soda ash is attended with considerable practical difficulties, owing to the necessity of retaining the contained ammonia. The bicarbonate is first exposed to a comparatively low heat in a closed roaster, after which it is finished in a muffle furnace at a bright red heat. The gases given off are drawn by an air-pump into a washing apparatus, where the ammonia is retained, and the carbonic acid, which passes on, is conducted to the absorption tower for again impregnating the ammoniacal brine. By this process the whole of the chlorine of common salt comes away as waste in the form of chloride of calcium. To obtain that body in combination as hydrochloric acid, Solvay proposed in his patent of 1872 to employ magnesia in place of lime in the decomposition of the sal ammoniac, the solution of chloride of magnesium remaining after the distillation is boiled to dryness, and being by the action of steam separated into magnesia and hydrochloric acid,—$MgCl_2 + H_2O = MgO + 2HCl$. The magnesia theoretically works in a circle, being changed into chloride on the liberation of the ammonia from the sal-ammoniac, and recovered again as magnesia with the formation of hydrochloric acid, as above indicated. But the expense of the process has hitherto been greater than the value of the product obtained, and the one weak point of the Solvay process is the loss of the hydrochloric acid, which forms an important element in the Le Blanc cycle. The loss of ammonia calculated as sulphate in the early days of the Solvay process was as much as 9 per cent on the carbonate of soda produced; but by successive improvements it has been reduced to not more than 5 per cent. The Solvay plant is very expensive, amounting, according to his own estimate, to £1600 per ton of soda ash produced daily; but other authorities put the capital expenditure as high as £2400 per ton worked daily.

Cryolite Soda.—Of the many processes other than those above mentioned, which have been proposed for soda-making, the only one practically employed is that in which cryolite forms the raw material. Cryolite, a fluoride of aluminium and sodium, $AlF_3 + 3NaF$, is a mineral substance found in extensive deposits at Ivikat (Ivigtut) (61° 34′ N. lat.) in south-west Greenland. For soda-making the mineral is treated by a process discovered in 1850 by Professor Julius Thomsen of Copenhagen. It is ignited with chalk or limestone, whereby carbonic acid is driven off and fluoride of calcium and aluminate of soda are formed—$2(AlF_3 + 3NaF) + 6CaCO_3 = 6CaF_2 + 3Na_2O, Al_2O_3 + 6CO_2$. The aluminate of soda is

separated from the artificial fluoride of calcium by lixiviation, and the solution so obtained is decomposed by treatment with carbonic acid, which produces a precipitate of alumina available for alum making, &c, leaving a solution of carbonate of soda About 8000 tons of cryolite are annually treated in Pennsylvania and in Denmark

Statistics of Soda Trade—No means exist for obtaining an accurate statement of the extent of the soda trade, and such estimates as are published can only be accepted as approximations based on knowledge of the productive capacity of existing works and the general course of trade Speaking at the Society of Chemical Industry (London section) in January 1883, the late Walter Weldon gave the following estimate (in tons) of the soda production of the world at that date —

	Le Blanc Soda	Ammonia Soda	Total
Great Britain	380,000	52,000	432,000
France	70,000	57 125	127,125
Germany	56,500	44,000	100,500
Austria	39,000	1,000	40,000
Belgium		8,000	8,000
United States		1,100	1,100
	545,500	163,225	708,725

In these figures the whole of the products made—soda ash crystals, bicarbonate, caustic soda, &c —are calculated in terms of pure carbonate, $NaCO_3$ Assuming the fairness of the calculation, we are warranted in stating the present (1887) production of alkali, as pure carbonate, to be not less than three quarters of a million of tons annually (W D—J PA)

SODOM AND GOMORRAH See DEAD SEA, vol VII pp 1-3, comp PHŒNICIA, vol XVIII p 803, and LOT

SODOMA, IL, or, more properly, SODONA (*c* 1479-1549), Italian painter GIANNANTONIO BAZZI (who until recent years was erroneously named RAZZI) appears to have borne also the name of "Sodona" as a family name, it is signed upon some of his pictures While "Bazzi" was corrupted into "Razzi," "Sodona" was corrupted into "Sodoma", and Vasari, followed by other writers on art, accounts for the latter name by giving various and explicit details which we leave undiscussed, for, if the painter did not really pass by the appellation of "Sodoma," we may fairly infer that explanations which would have been germane to that appellation are not germane to the man himself Bazzi was born at Vercelli in Piedmont towards 1479, and appears to have been in his native place a scholar of the painter Giovenone Acquiring thus the strong colouring and other distinctive marks of the Lombard school, he was brought to Siena towards the close of the 15th century by some agents of the Spannocchi family, and, as the bulk of his professional life was passed in this Tuscan city, he counts as a member of the Sienese school, although not strictly affined to it in point of style He does not seem to have been a steady or laborious student in Siena, apart from some attention which he bestowed upon the sculptures of Jacopo della Quercia Along with Pinturicchio, he was one of the first to establish there the matured style of the *Cinquecento* His earliest works of repute are seventeen frescos in the Benedictine monastery of Monte Oliveto, on the road from Siena to Rome, illustrating the life of St Benedict, in continuation of the series which Luca Signorelli had begun in 1498, Bazzi completed the set in 1502 Hence he was invited to Rome by the celebrated Sienese merchant Agostino Chigi, and was employed by Pope Julius II in the Camera della Segnatura in the Vatican He executed two great compositions and various ornaments and grotesques The latter are still extant, but the larger works did not satisfy the pope, who engaged Raphael to substitute his Justice, Poetry, and Theology In the Chigi palace (now Farnesina) Sodona painted some subjects from the life of Alexander the Great, Alexander in the Tent of Darius and the Nuptials of the Conqueror with Roxana are more particularly noticed When Leo X was made pope (1513) Bazzi presented him with a picture of the Death of Lucretia (or of Cleopatra, according to some accounts), Leo gave him a large sum of money in recompense and created him a cavaliere Bazzi afterwards returned to Siena, and at a later date went in quest of work to Pisa, Volterra, and Lucca From Lucca he returned to Siena, not long before his death, which took place on 14th February 1549 (the older narratives say 1554) He had squandered his property and died in penury in the great hospital of Siena Bazzi had married in youth a lady of good position, but the spouses disagreed and separated pretty soon afterwards A daughter of theirs married Bartolommeo Neroni, named also Riccio Sanese or Maestro Riccio, one of Bazzi's principal pupils

It is said that Bazzi jeered at the *History of the Painters* written by Vasari, and that Vasari consequently traduced him, certainly he gives a bad account of Bazzi's morals and demeanour, and is niggardly towards the merits of his art According to Vasari, the ordinary name by which Sodona was known was "Il Mattaccio" (the Madcap, the Maniac),—this epithet being first bestowed upon him by the monks of Monte Oliveto He dressed gaudily, like a mountebank, his house was a perfect Noah's ark, owing to the strange miscellany of animals which he kept there He was a cracker of jokes and fond of music, and sang some poems composed by himself on indecorous subjects In his art Vasari alleges that Bazzi was always negligent,—his early success in Siena, where he painted many portraits, being partly due to want of competition As he advanced in age he became too lazy to make any cartoons for his frescos, but daubed them straight off upon the wall Vasari admits, nevertheless, that Bazzi produced at intervals some works of very fine quality, and during his lifetime his reputation stood high

The general verdict is that Sodona was an able master in expression, motion, and colour His taste was something like that of Da Vinci, especially in the figures of women, which have grace, sweetness, and uncommon earnestness He is not eminent for drawing, grouping, or general elegance of form His easel pictures are rare His most celebrated works are in Siena In S Domenico, in the chapel of St Catherine of Siena, are two frescos painted in 1526, showing Catherine in ecstasy and fainting as she is about to receive the Eucharist from an angel —a beautiful and pathetic treatment In the oratory of S Bernardino, scenes from the history of the Madonna, painted by Bazzi in conjunction with Pacchia and Beccafumi (1536 to 1538)—the Visitation and the Assumption—are noticeable In S Francesco are the Deposition from the Cross (1513) and Christ Scourged, by many critics one or other of these paintings is regarded as Bazzi's masterpiece In the choir of the cathedral at Pisa is the Sacrifice of Abraham, and in the gallery of Florence a St Sebastian

SOEST, an ancient industrial town in Westphalia, Prussia, is situated in a fertile plain (*Soester Borde*), 27 miles to the east of Dortmund and 34 to the south-east of Munster Its early importance is borne witness to by its six fine churches, of which the most striking are St Peter's, St Mary-in-the-Fields, founded in 1314 and restored in 1850-52, and the Roman Catholic cathedral, founded in the 10th century by Bruno, brother of Otho the Great, though the present building was erected in the 12th century This last, with its very original façade, is one of the noblest ecclesiastical monuments of Germany Remains of the broad wall (now partly enclosing gardens and fields) and one of the gates still remain, but the thirty-six strong towers which once defended the town have disappeared and the moats have been converted into promenades Iron-working, the manufacture of soap, hats, cigars, and bricks and tiles, linen-weaving, tanning, and brewing, together with market-gardening and farming in the neighbourhood, and trade in cattle and grain, are the leading industries The population in 1880 was 13,985, and in 1885 14,848, of whom about 6000 were Roman Catholics

Mentioned in documents as early as the 9th century, Soest was one of the largest and most important Hanseatic towns in the Middle Ages, with a population estimated at from 30,000 to 60,000 It was one of the chief emporiums on the early trading route between Westphalia and Lower Saxony Its code of municipal laws (*Schram, jus susatense*), dating from 1144 to 1165, was one of the earliest and best, and served as a model even to Lubeck On the fall of Henry the Lion, duke of Saxony, Soest passed with the rest of Angria to Cologne In the 15th century the strife between the townsmen and the archbishops broke out in open war, and in 1444

the strong fortifications of the town withstood a long siege by an army of 60,000 men The women of Soest are said to have distinguished themselves in this contest (*Soester Fehde*) Papal intervention ended the strife and Soest was permitted to remain under the protection of the dukes of Cleves The prosperity of the town waned in more modern times in 1763 its population was only 3800, in 1816 it was 6687

SOFÁLA, a seaport town on the east coast of Africa, at the mouth of a river of the same name to the south of 20° S lat, the seat of a Portuguese commandant It is now a wretched place of about 1000 inhabitants, with not more than twenty European residents, and, as its port is obstructed with sandbanks, there is only a small coasting trade with Chiluan and Inhambane But Sofála was formerly a town of considerable importance, with a harbour capable of holding a hundred large vessels Previous to its conquest by the Portuguese in 1505 it was the chief and populous centre of a wealthy Mohammedan state, and the first governors of the Portuguese East African possessions were entitled captains-general of Sofala The identification of Sofala with Solomon's Ophir, to which Milton alludes (*Par Lost*, xi 399-401), is untenable

See *Bull Geogr Soc Moçambique* (1882) for an account of the Sofála mines, and, generally, Edrisí, *Climate* i, 8th section, Dapper, Baines, *The Gold Regions of South Africa* (1877), and Burton's notes to his edition of Camoens

SOFIA, since 1878 the capital of Bulgaria, though previously only a district town of the Tuna (Danube) vilayet of Turkey, is situated 1755 feet above the sea, in the midst of a dreary plain between the Stara Planina or main range of the Western Balkans and the bare but imposing granite mass of the Vitosh Mountains (3400 feet) It stands at the meeting of five great routes from Nish and Belgrade, Lom and Vidin, Plevna and Rustchuk, Philippopolis and Constantinople, and Kostendil and Salonica At present (1887) it is two days' journey from the nearest railway station (Tatar-bazarjik), and as the seat of government is inconveniently near the south-west extremity of the kingdom, but it lies on the prospective great railway route between Constantinople and Belgrade, and was in the eyes of those who selected it the prospective capital of a much more extensive territory The climate of Sofia is subject to severe seasonal and diurnal changes in January the thermometer sinks 4° below zero and in August approaches 100°, and the daily range is frequently 27 or 28 degrees Minarets and gardens give a certain beauty to the aspect of the town itself, but the outskirts are painfully destitute of foliage In an eastern suburb stands the royal palace, a vast building which cost more than 4,000,000 francs, and in that neighbourhood, on the site of an abandoned Turkish quarter, quite a new "European" town has sprung up The rest of Sofia retains its Turkish character, with tortuous streets and mean wooden houses The modern cathedral and the archbishop's palace are both large edifices of no special note Of the many mosques the most striking is the Buyuk-Jami, with its nine metal cupolas, but more historical interest attaches to the Sophia mosque, occupying the highest point in the town to which it gave its name It is now completely in ruins (the result of an earthquake), but tradition, which in this case is confirmed by the architecture of the building, asserts that it was a Christian church erected by a certain Byzantine princess Sophia Kanitz in 1871 still observed remains of old Byzantine frescos in the narthex The public baths occupy a very extensive building, with separate suites of apartments for different nationalities or rather religions The water as it issues from the springs has a temperature of 117° Sofia exports hides and skins to Vienna, &c, and especially goat-skins to Marseilles, its principal imports are Indian corn, wheat, and alcoholic liquors—the last a very large item Formerly the population was 50,000 In 1870 Kanitz found 19,000—a liberal estimate—8000 being Bulgarians, 5000 Turks, 5000 Jews (a colony dating from the expulsion from Spain), 900 Gipsies At present (1887) the total is 20,000 Close to the north of the town are extensive remains of strong Roman fortifications

Sofia is the *Serdica* or *Sardica* of the Romans and Greeks (so called after the Serds or Sards), the *Triaditza* of the Byzantine writers, and the *Sredec* of the Slavs "Sardica is my Rome," said Constantine before he thought of his new capital on the Bosphorus It had already been made the capital of Dacia Ripensis by Aurelian, and about 343 it became famous as the seat of a church council The town was plundered by Attila, and in 809 it was captured by the Bulgarians, who held it until the Turks got possession of it by stratagem in 1378, or more probably 1382 In 1443 Sofia was for a brief period occupied by the Hungarian John Hunyady (Corvinus), and on the defeat of his enterprise was laid waste by the retreating army In 1829 it was the headquarters of Mustapha Pasha of Scutari, whose ravages have made the name of Albanian a word of terror to the children in Sofia even now The Russians entered Sofia on 4th January 1878, after Gourko's passage of the Balkans

See Kanitz, *Donau Bulgarien*, 1877, Laveleye, *La Péninsule des Balkans*, 1886

SOGDIANA, or SOGDIANE, in Old Persian *Sughuda*, a province of the Achæmenian empire, the eighteenth in the list in the Behistun inscription of Darius (i 16), corresponded to the modern districts of Samarkand and Bokhara, that is, it lay north of Bactriana between the Oxus and the Jaxartes and embraced the fertile valley of the Polytimetus or Zarafshan Under the Greeks Sogdiana was united in one satrapy with Bactria, and subsequently it formed part of the Bactrian Greek kingdom till the "Scythians" (the Yue-chi) occupied it in the middle of the 2d century B C (comp vol xviii pp 586 *sq*, 592 *sq*) The valley of the Zarafshan about Samarkand retained even in the Middle Ages the name of the Soghd of Samarkand Arabic geographers reckon it as one of the four fairest spots in the world

ṢOHÁR, the second port of 'Omán, Arabia, situated on the Gulf of 'Omán in 24° 22′ N lat and 56° 45′ E long It is a place of considerable trade and industry, well built, fortified with walls and a castle, and inhabited by a hospitable and far from bigoted population of the 'Ibádí sect The anchorage is good, sheltered between two promontories, and the surrounding country is populous and fertile Indeed the coast-land of 'Omán is naturally the most favoured part of Arabia

The town of Sohár is older than Islam, and its cloths are mentioned in the life of Mohammed (Ibn Hisham, p 1019) Before the Moslem conquest it was in the hands of the Persians, and the Persian name Mazūn is not uncommonly applied to it by older Arabic writers Under Islam it became the capital of 'Omán, and it is sometimes called 'Omán, from which fact it has sometimes, but very precariously, been identified with the Omana of classical writers In the earlier Middle Ages Sohar was one of the first commercial cities of Islam on the Indian Ocean and had an active part in the China trade This prosperity was unabated when Mokaddasí wrote of it (p 92) towards the close of the 10th century, in the 12th century, when Edrisí wrote, the China trade was a thing of the past, and about 1230 Ibn Mojáwir describes it as a ruin inhabited by the demons of the desert Its decay appears to be connected with the rise of other ports—Kalhát on the Arabian and Ormuz on the Persian side of the Persian Gulf—but more especially with the political convulsions of 'Omán This district, which has always had an isolated position in Eastern history, early became a stronghold of the Khawárij ('Ibádíya) and paid very intermittent obedience to the caliphs till it was reduced by Mo'tadid about the year 900 Even after this conquest the native imams held their ground in the mountainous inland country at Nazwa (Istakhrí, p 26), and renewed the struggle for independence with the Buwaihid and Seljúk sovereigns of Fars, who succeeded in these regions to the power of the caliphate Ibn Mojáwir connects the destruction of Sohár with these struggles, and, though he seems to imply a later date, it is possible that his statement is to be combined with what Ibn al Athír (ix 387) tells of the rising of Al Ráshid billáh about 1050 After this event there is a period of obscurity in the annals of 'Omán, the independence of the country was ultimately secured under the native (Azdite) princes of Nazwa, but Sohár never recovered its importance It is mentioned, however, by Marco Polo, under the name of Soer, as trading in horses with Malabar, and also by Ibn Batúta, and must therefore have been resettled soon after the time of Ibn Mojáwir Sohár was seized by

the Portuguese in 1508 and held by them till about 1650. In the 18th century Niebuhr speaks of it as a quite unimportant place; Wellsted in 1836 assigned to it a population of 9000; Palgrave in 1863 estimated the population at 24,000, an estimate the more remarkable that in the interval the town had suffered severely from the Wahhabis. The *Red Sea Pilot* (1883) gives the more probable figure of 4000 to 5000.

SOISSONS, a city of France, in the department of Aisne, the seat of a bishopric and a fortified post on the left bank of the Aisne at the junction of the Crise, lies 65 miles north-east of Paris by the railway to Laon. The population in 1881 was 10,895 (11,112 in the commune). The cathedral of Notre Dame St Gervais and St Protais, begun in the second half of the 12th century and finished about the end of the 13th, is 328 feet long and 87 wide; the vaulting of the nave is 100 feet above the pavement. The single tower dates from the middle of the 13th century and is a fairly good imitation of those of Notre Dame of Paris, which it equals in height (216 feet). The transepts are of different dates and dissimilar in their arrangement. In the north transept there is a very fine door on the east; the south transept is the oldest and most graceful portion of the whole edifice. The choir is surrounded with eight square chapels, and the apse with five large polygonal chapels, of which the three in the middle (as well as the high windows of the choir) still retain their fine 13th-century glass. The rose-window of the north transept represents the life of the Virgin in twelve medallions. The high altar is flanked by two marble figures representing the annunciation and above it is an Adoration of the Shepherds ascribed to Rubens; the cathedral also has some rich 16th-century tapestries. Considerable remains still exist of the magnificent abbey of St Jean des Vignes, where Thomas a Becket resided from 1161 to 1170, and which was rebuilt in the 13th century; these include the ruins of two cloisters (the smaller dating from the Renaissance), the refectory, and above all the cathedral-like façade of the church (recently restored). Of the three portals with twisted columns the central one is adorned with statues; above them runs a gallery, over which again is a large window; the two unequal towers (230 and 246 feet) of the 15th and 16th centuries are surmounted by beautiful stone spires, which command the town. The ruins of this fine building are unfortunately occupied by the military authorities. The church of St Léger, erected in 1139 and rebuilt at the beginning of the 13th century, was formerly attached to an abbey of the Génovéfains. Beneath are two crypts of the 12th and 13th centuries. Of the abbey church of St Pierre, built in the 12th century in the Romanesque style, the only remains are the façade and two bays of the choir. The royal abbey of Notre Dame was founded in 660 for monks and nuns by Leutrade, wife of Ebroin, the celebrated mayor of the palace. The number of the nuns (216 in 858), the wealth of the library in manuscripts, the valuable relics, the high birth of the abbesses, the popularity of the pilgrimages, all contributed to the importance of this abbey, of which there exist only some inconsiderable remains. The wealthiest of all the abbeys in Soissons and one of the most important of all France during the first two dynasties was that of St Médard, on the right bank of the Aisne, founded in 560 by Lothaire I, beside the villa of Syagrius, which had become the palace of the Frankish kings. St Médard, apostle of Vermandois, and Kings Lothaire and Sigebert were buried in the monastery, which became the residence of 400 monks and the meeting-place of several councils. It was there that Childeric III, the last Merovingian, was deposed and Pippin the Short was crowned by the papal legate; and there Louis the Pious was kept in captivity in 833. The abbots of St Médard coined money, and in Abelard's time (12th century) were lords of 220 villages, farms, and manors. At the battle of Bouvines (1214) the abbot commanded 150 vassals. In 1530 St Médard was visited by a procession of 300,000 pilgrims. But the religious wars ruined the abbey, and, although it was restored by the Benedictines in 1637, it never recovered its former splendour. Of the seven churches and the conventual buildings of the ancient foundation there hardly remains a trace. The site is occupied by a deaf and dumb institution, the chapel of which stands over the crypt of the great abbey church, which was altered in the 12th century. In the crypt is a stone coffin, said to have been Lothaire's, and close at hand is an underground chamber, reputed to have been the place of captivity of Louis the Pious. The civil buildings of Soissons are not of much interest. The hôtel de ville contains a museum with scientific and archæological collections; the hôtel dieu goes back to the 13th century; the library contains 40,000 volumes and curious manuscripts. Among the industrial establishments are tanneries, saw-mills, and foundries and factories for the production of stoves, agricultural implements, candles, and chocolate. Grain, flour, haricot beans of exceptional quality, pease, wool, hemp, flax, cattle, timber, and charcoal are the principal articles of trade. There is also a large bottle factory, and work is done for the flannel and blanket factories of Rheims.

Soissons is generally believed to occupy the site of the oppidum of Gallia Belgica called *Noviodunum* by Cæsar; but some writers identify this place with Noyon, Noyant, or Nouvion. One thing is clear, that this oppidum was the capital of the Suessiones, who occupied twelve towns and whose king, Divitiacus, one of the most powerful in Gaul, had extended his authority even beyond the sea among the Britons. In 58 B.C. Galba, king of the Suessiones, separated from the confederation of the Belgians and submitted to the Romans. At the beginning of the empire Noviodunum took the name of *Augusta Suessionum*, and afterwards that of *Suessiona*, and became the second capital of Gallia Belgica, of which Rheims was the metropolis. The town was before long surrounded with a regular wall and defended by a citadel; and it became the starting-point of several military roads (to Rheims, Château-Thierry, Meaux, Paris, Amiens, and St Quentin). Christianity was introduced by St Crispin and St Crispinian, men of noble birth, who, however, earned their livelihood by shoemaking, and thus became patrons of that craft. After their martyrdom in 297 their work was continued by St Sinitius, the first bishop of Soissons. After the barbarians had crossed the Rhine and the Meuse Soissons became the metropolis of the Roman possessions in the north of Gaul, and on the defeat of Syagrius by Clovis the Franks seized the town. It was at Soissons that Clovis married Clotilde, and, though he afterwards settled at Paris, Soissons was the capital of his eldest son Lothaire, and afterwards of Chilperic I, king of Neustria. It was not till the time of Chilperic's son, Lothaire II, that the kingdom of Soissons was incorporated with that of Paris. In 752 Pippin the Short was at Soissons proclaimed king by an assembly of *leudes* and bishops, and he was there crowned by the papal legate St Boniface before being crowned at Saint Denis by the pope himself. Louis the Pious did penance there after being deposed by the assembly at Compiegne. Under Charles the Fat (886) the Normans failed in an attempt against the town, but laid waste St Médard and the neighbourhood. In 923 Charles the Simple was defeated outside the walls by the supporters of Rudolph of Burgundy, and Hugh the Great besieged and partly burned the town in 948. Under the first Capets Soissons was held by hereditary counts, frequently at war with the king or the citizens. Thus the latter bought in 1131 a communal charter from Louis VI and their bishop. In 1155, at an assembly of prelates and barons held at Soissons, Louis VII issued a famous decree forbidding all private wars for a space of ten years; and in 1325 Charles the Fair replaced the mayor of Soissons by a royal provost dependent on the bailiwick of Vermandois, the inhabitants retaining only the right of electing four *échevins*. Louis of Châtillon, count of Soissons, was killed at Crécy, and his son, a hostage for King John in England, sold his countship to Enguerrand de Coucy to obtain money for his ransom in 1367. Finally the last count of Soissons, sprung from a branch of the house of Bourbon, rebelled against Louis XIII, and defeated the royal troops at La Marfée in 1641, but perished in the battle. The town had to suffer severely during the war of the Hundred Years; in 1414, when it was held by the Burgundians, it was captured and sacked by the Armagnacs under the dauphin; and this same fate again befell it six times within twenty years. The treaty of Arras (1435) brought it again under the royal authority. It was sacked by Charles V in 1544 and in 1565 by the Huguenots, who

laid the churches in ruins and, supported by the prince of Condé, count of Soissons, kept possession of the town for six months. During the League Soissons eagerly joined the Catholic party. Mayenne made the town his principal residence, and he died there in 1611. A European congress was held there in 1728. In 1814 Soissons was captured and recaptured by the allies and the French. In 1815, after Waterloo, it was a rallying point for the vanquished, and it was not occupied by the Russians till the 14th of August. In 1870 it capitulated to the Germans after a bombardment of three days.

SOKOTO, an important Fulah kingdom or empire in Central Soudan, comprising what are frequently called the Haussa states. Its boundaries (see vol. i. pl. II.) are irregularly marked off by the plateau lands of Air or Asben on the north, the kindred Fulah state of Gandu on the west, while the river Binué practically forms its southern limit as far as the meridian of 10° E., beyond this it runs south into the Congo basin. On the east lies the kingdom of Bornu. From north-west to south-east Sokoto has a length little short of 900 English miles and its average breadth is about 280. The whole area has been roughly computed to be equal to that of Spain (about 195,000 square miles), and to have a population of from ten to twelve millions. The country may be described as a great undulating plain, rarely exceeding 1000 feet in height, with the exception of the province of Bauchi in the centre, which runs into a highland region with heights of 3000 feet, and the still more imposing masses of Adamawa in the south, which are said to attain an altitude of 10,000 feet in Mount Alantika. In other respects Sokoto presents more varied features, chiefly determined by the amount of rainfall, though the varying fertility of the soil is a not unimportant factor. In the southern parts, where there are almost perpetual rains, large streams and rivers are numerous,—the feeders of the Binué, the great eastern (left-hand) tributary of the Niger. Here grow the virgin forests with giant growths and exuberant foliage, with creepers, with bananas and plantains, palm-oil trees and yams. In the more temperate—because more elevated—districts of the middle area, with a smaller rainfall, the vegetation is less luxuriant, and such fruits as the date, lime, and pomegranate are cultivated. In the northern parts the climate is still more arid, and the country is burned up for the greater part of the year. This is the region of acacias and mimosas, of baobabs, of the branching dûm palm and the curiously bulged deléb. Here are no forests nor rank grass, while the exigencies of a dense population have caused the clearing away of the bush except on the most barren spots, where it supplies the necessary fuel for domestic purposes. In this northern district there are no streams except in the wet season, and the wants of the people are supplied by fountains in the more favoured places, and by wells—frequently very deep—in those not so advantageously situated. Lying within the tropics, Sokoto is subject to excessive heat,—damp and steamy in the south, dry and furnace-like in the north, where it suffers from the hot winds from the Sahara. In Adamawa the rainy season—or, to be more correct, the season of excessive rains—commences in April and lasts till October or later, while in Gober in the north the rains commence in June and seldom last more than three months, during which the country becomes transformed from a repellent desert into a well-cultivated nursery garden.

For Central Africa Sokoto may be described as fairly healthy, though, as may be expected from a conjunction of excessive heat with excessive rain, fevers are not uncommon in the southern parts, while ophthalmia is prevalent in the north, especially among the poorer classes, who are compelled to expose themselves to the blinding dust from the deserts and the excessive glare of the sun reflected from the burning sands.

The natural productions of Sokoto are such as are more or less common throughout the whole of the SOUDAN (*q.v.*). Among cereals rice and wheat are cultivated in many parts, though the staple productions are Kaffir corn, millet, and maize. Sweet potatoes, ground nuts, yams, onions, and other vegetables are largely grown. Of fruits dates, pomegranates, citrons, and bananas abound in more restricted areas. The Shea butter tree supplies an excellent oil for lamps, and also for cooking, though it is only used by the poorer classes. The palm oil tree is only found in the damp basin of the Binué. The most important vegetable products are cotton and indigo, which are universally grown. The cotton is manufactured into cloth, being used by the native population as well as largely exported to neighbouring countries. In some parts a species of silk found in the forests is largely used, and the people of Yakoba in Bauchi are said to rear the silkworm. Of mineral products there seem to be few, though it is known that both silver and lead occur in the Binué area. Iron is extensively diffused and of excellent quality.

The inhabitants of this extensive region, held together by a conquering race and not by any natural tie into one common kingdom, are of diverse tribes and affinities. They, however, may be roughly divided into three groups. (1) First come the pure Negro races of Adamawa, of which the chief tribe is the Batta. (2) The Haussa form the mass of the population except in Adamawa. They are pre-eminent among Negroes for their physical appearance and intellectual abilities. They are wonderfully skilled in various arts and industries and noted for their commercial genius and enterprise. Mohammedanism is their religion, and indeed in all respects they are well advanced on the road to civilization. They are very fond of voluminous clothes. (3) The Fulahs are a Hamitic race, who from being simple herdsmen in the beginning of the 19th century have become the rulers and masters over a hundred alien races between the Atlantic and Lake Tchad. They have not the commercial or industrial skill of the Haussa, but in other respects have reached a higher level. They are of slender build and are distinguished by their light coppery colour. The inhabitants of Sokoto live mostly in large towns, many of which contain from 10,000 to 20,000 inhabitants. These towns are all protected by strong mud walls and outer dry moats. Their interior is divided into a series of compounds, each entered through a flat roofed audience chamber. Inside are the beehive shaped huts of the household. The gateways are also strongly fortified. The ruler over Sokoto is a Fulah sultan, whose power is absolute, though tempered by a species of feudal system. The governors of some of the larger provinces, though owning allegiance to the sovereign, are mostly hereditary, and beyond sending a yearly tribute are practically independent. The tie indeed is more religious than anything else. The great weakness of the empire is its want of coherence and the absence of a strong central Government. Yet, though always appearing to be on the point of falling to pieces, it contrives to keep together. The condition in which Barth found it in 1855 was practically the same as when the present writer visited it in 1885.

The chief provinces of Sokoto are Zamphoro, Zaria, Katsena, Bauchi, Kano, and Adamawa. The most important towns are—Sokoto, the acknowledged capital of the empire, famed chiefly for its leather-work and straw hats (it divides with Wurnu the distinction of being the residence of the sultan; Clapperton died here in 1837), Wurnu, about 18 miles farther east, the present (1887) headquarters of the court, Kano, the great commercial emporium of Central Soudan, and Yakoba, chiefly noted for its large size,—said to contain 150,000 inhabitants.

The history of Sokoto may be said to have commenced with the 19th century. Previous to that date little is known further than that the country was divided among a number of small chiefs, a prey to the powerful kings of Bornu, Kebbi, and Songhwai (Songhai). In 1802 the Fulahs, then little regarded and semi-serfs in position, were scattered all over the country, apparently without any national tie to unite them to common action. At last, however, an imâm—one Othman dan Fodio—appeared, who with the watchword of Islam gave a new life to his tribesmen and in an incredibly short time transformed them from peaceable nomads into soldiers of the Crescent, and after a few initial reverses swept like a whirlwind over an enormous area, establishing himself as ruler and Mohammedanism as the religion of the whole of Central Soudan. At his death the parts now known as Sokoto fell to the share of his son Bello, and in the family of Othman the reins of government have since remained, though the descent is not as a rule from father to son, but either to a brother or a brother's son. The latest phase in the history is the proclaiming of a protectorate over a part of Sokoto on the Binué by the British Government, and the handing over of the administration of the Niger region to the Royal Niger Company. To this company the sultan has conceded all his rights on the Binué and a monopoly of trade throughout his dominions, thus making them practically masters of all foreign intercourse.

The most important sources of information regarding Sokoto are—Clapperton's *Journeys* in the early part of the 19th century, Barth's *Travels in Central Africa* between 1849 and 1855—a perfect mine of information, and Rohlfs's *Reise durch Nordafrika vom Mittelmeer nach dem Tschad-See* in 1866-67. Among later and minor travellers have been Flegel, who visited Sokoto in 1880, and Thomson, who conducted a commercial and political mission to the court of the sultan in 1885. (J. TH.)

SOLAN GOOSE See GANNET

SOLARIO, ANTONIO (c 1382–1455), a painter of leading importance in the Neapolitan school, is commonly called Lo Zingaro, or The Gipsy His father is said to have been a travelling smith To all appearance Antonio was born at Civita in the Abruzzi, although it is true that one of his pictures is signed "Antonio de Solario Venetus," which may possibly be accounted for on the ground that the signature is not genuine Solario is said to have gone through a love-adventure similar to that of the Flemish painter, Quintin Massys He was at first a smith, and did a job of work in the house of the prime Neapolitan painter Colantonio del Fiore, he fell in love with Colantonio's daughter, and she with him, and the father, to stave him off, said if he would come back in ten years an accomplished painter the young lady should be his Solario studied the art, returned in nine years, and claimed and obtained his bride The fact is that Colantonio del Fiore is one of those painters who never existed, consequently his daughter never existed, and the whole story, as relating to these particular personages, must be untrue Whether it has any truth, in relation to some unidentified painter and his daughter, is a separate question which we cannot decide Solario made an extensive round of study,—first with Lippo Dalmasio in Bologna, and afterwards in Venice, Ferrara, Florence, and Rome On returning to Naples he rapidly took the first place in his art His principal performance is in the court of the monastery of S Severino—twenty large frescos illustrating the life of St Benedict, now greatly decayed, they present a vast variety of figures and details, with dexterous modelling and colouring Sometimes, however, Lo Zingaro's colour is crude, and he generally shows weakness of draughtsmanship in hands and feet His tendency is that of a naturalist,—the heads life-like and individual, and the landscape backgrounds better invented and cared for than in any contemporary In the Studj gallery of Naples are three pictures attributed to this master, the most remarkable one being a Madonna and Child Enthroned with Saints The heads here are reputed to be mostly portraits Solario initiated a mode of art new in Naples, and the works painted between his time and that of Tesauro are locally termed "Zingareschi" He had many scholars, but not of pre-eminent standing—Nicola Vito, Simone Papa, Angiolillo Roccadirame, Pietro and Ippolito dal Donzello It has often been said that Solario painted in oil, but of this there is no evidence

SOLDER is a metallic alloy or metal employed for cementing or binding together two metallic surfaces The solder is applied to the surfaces to be united in a molten state, and it is therefore generally either a more fusible body than the metal to be acted on or it is presented in a more fusible condition The process of autogenous soldering consists in uniting the individual metallic edges themselves by melting and fusing them in the heat of the oxyhydrogen blowpipe or by means of an ignited blast of mixed coal gas and air Autogenous soldering is extensively used in connexion with large plumber work Ordinary solders are divided into hard and soft classes, the hard comprising such as require a red heat for their melting The soft solders used by plumbers and tinsmiths consist of variable mixtures of lead and tin, and for pewterers' use bismuth is added to these The hardest brazing solder has equal parts of copper and zinc, and for softer qualities increased amounts of zinc with tin and sometimes antimony are employed For fine jewellery alloys of gold, silver, and copper are used, silver solder is employed for inferior qualities, and even common soft solder finds extensive employment in the jewellery trade Silver is the proper solder for German silver manufactures also, and gold is the medium for joining the edges of platinum vessels In soldering, the metallic edges to be united must be free from oxidation and dirt, and to keep them unoxidized during the operation several fluxes are used, such as borax in brass soldering, rosin and solution of zinc chloride for tin-plate, zinc chloride for zinc, rosin and tallow for lead and tin, and olive oil in pewter work Special machinery has been devised for the soldering of the tinned cases now so extensively employed in the preserved food trade In common soft soldering the solder is melted and applied to the joint by a heated iron or copper soldering bolt, but solders are also applied by being melted on in the open fire, or in the muffle furnace, by immersing the joint in a bath of molten solder, or by pouring the molten material on the joint In dealing with hard solders the heat of the blowpipe flame is used

SOLE Soles are a group of Flat-Fishes (*Pleuronectidæ*), which is represented by numerous species in all suitable localities within the temperate and tropical zones, they become, however, scarce in the southern parts of the southern temperate zone, and are absent altogether in some districts—for instance, on the coasts of southern Australia Many of the species enter fresh water freely, and some have become thoroughly acclimatized in it Soles are a highly specialized type of flat-fish, their mouth is very narrow, twisted round to the blind side, and small teeth are developed on that side only As they always lie or swim on one side, the pectoral fins have ceased to have a function, and consequently these organs are reduced in size, and in many of the species are mere rudiments or are lost entirely The eyes are small, invariably on the right side of the fish, the upper occupying a position more or less in advance of the lower Soles are littoral fishes, inhabiting sandy bottoms, shifting with the season from shallow into somewhat deeper water Like all flat-fishes they are carnivorous, but feed on small animals only, none attain to a large size, scarcely exceeding that of 2 feet Of the forty species known of the genus *Solea*, four are found on the British coast, the one most generally known and commercially most important is the Common Sole (*Solea solea*), it seems to occur in greater or less abundance on all flat coasts of Europe, but its numbers have been considerably thinned within the last quarter of a century, at least on the British coasts, doubtless in consequence of the introduction of the trawl At any rate, that over-fishing is the cause of the decrease of this valuable table fish is amply proved by the fact that simultaneously with the quantity the average weight of the fish has been diminished, soles of 12 inches in length and of 8 ounces in weight being now in many localities the largest that can be obtained At present young specimens form the majority of the soles in the market, and are sold under the names of "slips" or "tongues" During the breeding-season, which falls in the months from February to April, soles lose much of their flavour It is a singular fact that male soles seem to be almost unknown, and some ichthyologists account for it by supposing that the males remain much smaller than the females, and are overlooked in consequence The Lemon Sole (*Solea aurantiaca*) is much less esteemed than the common sole, and more rarely seen in the market, probably because it is locally distributed in deeper water. It is of a yellow colour, marbled with brown and irregularly spotted with black, the pectoral fin is ornamented with an ovate black spot on its hinder half Even when this bright coloration has disappeared in the fish after death, it may always be distinguished from the common sole by its large dilated nasal opening on the blind side, which is surrounded by a broad fringe The Variegated Sole (*Solea variegata*) is at times taken in considerable numbers

on the south coast by means of the trawl, and esteemed as a table fish It differs from the two preceding species by the rudimentary condition of the pectoral fins, that of the blind side being minute The colour is brown, darker bands cross the body, and are darkest on the dorsal and anal fins, where they appear as a row of about six large spots It does not appear to grow to the same size as the common sole The fourth British species, *Solea minuta*, is still smaller, not much exceeding 5 inches in length, it is therefore not of commercial importance, although it may be caught at times in the trawl in large numbers As in the preceding species, the pectoral on the blind side is minute, but that of the right side is large enough to show a distinct black spot The colour of the body is brownish or greyish, with small black spots, and every sixth or seventh ray of the dorsal and anal fins is black

Flat-fishes resembling soles abound on the shores of the Indian Ocean beside the true soles, but they have the eyes on the left side of the head and lack pectoral fins altogether They have been referred, therefore, to distinct genera, such as *Plagusia* and *Cynoglossus*

SOLEURE, or SOLOTHURN, is one of the cantons of Switzerland, ranking as tenth in the Confederation, and taking its name from its chief town As it consists simply of the territories won by the city, its irregular shape is easily accounted for It takes in most of the valley of the Aar between the towns of Soleure and Olten, but stretches across the eastern Jura to Dornach not far from Basel, while to the south it tends in the direction of Bern The total area is 305 9 square miles, of which all but 25 4 square miles is classed as "productive," 103 3 square miles of this being covered by forests In other words, 91 7 per cent is fertile The highest point in the canton is the Hasenmatte (4754 feet), in the range behind the town of Soleure, in which too is the Weissenstein (4213 feet), so well known as a great centre for the air and whey cure, as also for its fine view In 1880 the population of the canton was 80,424 (an increase of 5754 on the census of 1870), the women outnumbering the men by 1704 Of these no fewer than 79,514 are German-speaking

Soleure now includes 63,037 Roman Catholics to 17,114 Protestants, but in the ten years 1870–1880 the latter increased by 4666, the former only by 965 Ecclesiastically the districts now forming part of the canton belonged till 1814 to the dioceses of Lausanne, Basel, and Constance, but since the complete reorganization of 1828 it is part of the diocese of Basel, and the bishop of Basel lives in the city of Soleure

The only places of any size in the canton are its capital, Soleure (7668 inhabitants), which possesses the finest armoury in Switzerland, and Olten (3979) It is counted as one of the most fertile and productive cantons in the Confederation, and exports iron, wood, marl, marble, glass, &c In educational matters it takes a high place, and its two chief towns are connected by a railway, Olten being one of the principal railway junctions in Switzerland, and the meeting place of the St Gotthard railway with the main lines branching off to the north, east, and west

An old rhyme claims for the town of Soleure the fame of being the oldest place in "Gallia" save Treves Certainly its name "Salodurum" is found in Roman inscriptions (the termination possibly pointing to a Celtic origin), and its position as commanding the approach to the Rhine from the south west has led to its being more than once strongly fortified Situated just on the borders of Alamannia and Burgundy, it seems to have inclined to the latter allegiance, and it was at Soleure that in 1038 the Burgundian nobles made their final submission to the emperor Conrad II The mediæval town grew up round the house of secular canons founded in honour of St Ursus and St Victor (two of the Theban legion who are said to have been martyred here in the 3d century) by Queen Bertha, either the mother of Charlemagne and wife of Pippin (8th century) or the more famous wife of Rudolph II., king of Burgundy (10th century), and was naturally in the diocese of Lausanne The prior and canons had many rights over the town, but criminal jurisdiction and the "advocatia" of the house remained with the kings of Burgundy, passed to the Zäringen dynasty, and on its extinction in 1218 reverted to the emperor The city thus became a free imperial city, and in 1252 shook off the jurisdiction of the canons and took them under its protection In 1295 we find it allied with Bern, and this connexion is the key to its later history It helped Bern in 1298 in the great fight against the nobles at the Dornbuhl, and again at Laupen in 1339 against the jealous Burgundian nobles It was besieged in 1322 by Duke Leopold of Austria (the defeated of Morgarten) during the struggle for the empire, but he was compelled to withdraw In the 14th century the government of the town fell into the hands of the guilds, which practically filled all the public offices Through Bern (which became a member in 1353) Soleure was drawn into association with the Swiss Confederation An attempt to surprise it in 1382, made by the decaying Kyburg branch of the Hapsburgs, was foiled, and resulted in the admittance of Soleure in 1385 into the Swabian League and in its sharing in the Sempach war Though Soleure took no part in that battle, she is included in the Sempach ordinance of 1393 and in the great treaty of 1394 by which the Hapsburgs renounced their claims to all territories within the Confederation In 1411 she in vain sought to be admitted into the Confederation, a privilege only granted to her in 1481 at the diet of Stanz, after she had taken part in the Aargau, Italian, Toggenburg, and Burgundian wars It was also in the 15th century that by purchase or conquest the town acquired the main part of the territories forming the present canton In 1529 the majority of the "communes" went over to the Reformers, and men were sent to fight on Zwingli's side at Kappel (1531), but in 1533 the old faith regained its sway, and in 1586 Soleure was a member of the Golden or Borromean League Though the city ruled the surrounding districts, the peasants were fairly treated, and hence their revolt in 1653 was not so desperate as in other places Soleure was the usual residence of the French ambassador, and no doubt this helped on the formation of a "patriciate," for after 1681 no fresh citizens were admitted, and later we find only twenty-five ruling families distributed over the eleven guilds Serfage was abolished by Soleure in 1785 The old system of the city ruling over eleven bailiwicks came to an end in March 1798, when Soleure opened its gates to the French army She was one of the six "directorial" cantons under the 1803 constitution In 1814 the old aristocratic government was set up again, but this was finally broken down in 1839, Soleure in 1832 joining the League of the Seven to guarantee the maintenance of the new cantonal constitutions Though distinctly a Roman Catholic canton, she did not join the "Sonderbund," and voted in favour of the federal constitutions of 1848 and 1874 Since 1830 she has revised her constitution in 1840, 1850, 1856, and 1875, besides three partial revisions of 1867, 1869, and 1881 The present constitution may be described as an ultramontane democracy, the priests having very great influence The "Kantonsrath" or legislative assembly is elected by all citizens over twenty years of age, in the proportion of one member to 800 inhabitants This assembly selects the "Regierungsrath" or executive, consisting of five members In both cases the period of office is five years, though on the demand of 4000 citizens a popular vote must be taken as to whether the existing members shall continue to sit or not In the canton the "obligatory referendum" and the "initiative" are legal By the former all laws passed by the assembly, and all financial resolutions involving the expenditure of 100,000 francs or of an annual sum of 20,000 francs, must be approved by a popular vote By the latter 2000 citizens can compel the assembly to consider any proposal for making a new law or for amending an old one Further, the demand of the majority of the assembly or of 3000 citizens is sufficient to necessitate a popular vote as to the advisability of revising the constitution, the revised draft itself requiring a further popular vote

SOLI, an ancient town of Asia Minor, on the coast of Cilicia, between the rivers Lamus and Pyramus, from each of which it is about 62 miles distant Colonists from Argos in Greece and Lindus in Rhodes are described as the founders of the town, which is first mentioned in history at the time of the expedition of the younger Cyrus In the days of Alexander the Great it was so wealthy that that conqueror exacted from its inhabitants a fine of 200 talents In the war between Mithradates and the Romans Soli was destroyed by Tigranes, but it was subsequently rebuilt by Pompey, who settled there many of the pirates whom he had captured, and called the town after himself, Pompeiopolis Soli was the birthplace of Chrysippus the Stoic and of the poets Philemon and Aratus The bad Greek spoken there gave rise to the

term σολοικισμός, "solecism," which has found its way into all the modern languages of Europe. Extensive ruins still mark the site of the town; the place is now called Mezetlu.

SOLICITOR. See ATTORNEY. It should be noticed that by the Supreme Court of Judicature Act, 1873, § 87, all persons admitted as solicitors, attorneys, or proctors of any English court, the jurisdiction of which was transferred by the Act to the High Court of Justice or the Court of Appeal, were thenceforth to be called solicitors of the supreme court. The title of attorney-general, however, still remains as that of the highest law officer of the crown. The Legal Practitioners Act, 1876, and the Solicitors Act, 1877, enabled solicitors to practice as proctors in the ecclesiastical courts (see PROCTOR). The Conveyancing Act, 1881, having made great changes in the practice of conveyancing, it became necessary to place the remuneration of solicitors upon a new basis. This was done by the Solicitors Remuneration Act, passed on the same day as the Conveyancing Act. It provides for the framing of general orders, fixing the principles of remuneration with reference *inter alia* to the skill and responsibility involved, not, as was generally the case before, with reference simply to the length of the documents perused or prepared. General orders in pursuance of the Act were issued in 1882.

In Scotland solicitors in the supreme court are not, as in England, the only persons entitled to act as law agents. They share the privilege with writers to the signet in the supreme court, with solicitors at law and procurators in the inferior courts. This difference is, however, now of little importance, as by the Law Agents Act, 1873, any person duly admitted a law agent is entitled to practise before any court in Scotland. In the United States the term solicitor is used in some States in the sense which it bore in England before the Judicature Act, viz., a law agent practising before a court of equity.

Many of the great public offices in England and the United States have their solicitors. In England the treasury solicitor fills an especially important position. He is responsible for the enforcement of payments due to the treasury. The office of queen's proctor is now combined with that of treasury solicitor. Under his powers as queen's proctor the treasury solicitor acts as administrator of the personal estate of an intestate which has lapsed to the crown, and intervenes in cases of divorce where collusion is alleged (see DIVORCE). Since the Prosecution of Offences Act, 1884, he has also acted as director of public prosecutions. In the United States the office of solicitor to the treasury was created by Act of Congress in 1830. His principal duties are to take measures for protecting the revenue and to deal with lands acquired by the United States by judicial process or vested in them by security for payment of debts.

SOLICITOR-GENERAL. See ATTORNEY-GENERAL. The position of the solicitor-general for Scotland in the main corresponds with that of the English solicitor-general. He is next in rank to the lord-advocate. In the United States the office of solicitor-general of the United States was created by Act of Congress in 1870.

SOLIMAN, or SULEIMAN, sultan of the Ottomans, surnamed The Magnificent, born about 1490, was the only son of Selim I., whom he succeeded in 1520. He died while he was besieging Szigetin Hungary, on September 5, 1566. See TURKEY.

SOLIMAN, or SULEIMAN, shah of Persia. See PERSIA, vol. xviii. p. 639.

SOLINGEN, a Prussian town, in the province of the Rhine, stands on a height near the Wupper, 13 miles east-by-south of Düsseldorf. It is one of the chief seats of the German iron and steel industry, its specialty consisting in all kinds of cutting implements of steel. Solingen sword-blades have been celebrated for centuries, and probably form part of the equipment of every modern army, while bayonets, knives, scissors, surgical instruments, files, steel frames, and the like are also produced in enormous quantities. These articles are largely made by the workmen at their own homes and supplied to the depôts of the large dealers; there are about 30,000 workers in steel in Solingen and its vicinity. The population of the town in 1885 was 18,643, of whom three-fourths were Protestants.

Solingen is an ancient place, and received its town charter in 1374. Sword blades have been made here since the early part of the Middle Ages, and tradition affirms that the art was introduced during the crusades by smiths from Damascus.

SOLIS, ANTONIO DE (1610-1686), Spanish dramatist and historian, was born in 1610 at Alcala de Henares, and studied law at Salamanca, where he is said to have produced a comedy which was acted in 1627. About 1640 he became secretary to the duke of Oropesa, whom he accompanied in various official missions; in 1654 he became one of the secretaries of Philip IV., and afterwards he was appointed chronicler. In his later years he joined one of the religious orders. He died at Madrid in 1686.

Of the nine extant plays of Solis two at least have some place in the history of the drama,—*El Amor al Uso* ("Love à la Mode") having afterwards been adapted by T. Corneille, while *La Gitanilla de Madrid* ("The Gipsy of Madrid"), itself founded on the "novela" of Cervantes, has been made use of by Rowley and Middleton, P. A. Wolff, and, directly or indirectly, by other more recent authors. The titles of the remaining seven are *Triunfos de Amor y Fortuna*, *Eurudice y Orfeo*, *El Alcazar del Secreto*, *Las Amazonas*, *El Doctor Carlino*, *Un Bobo haze ciento*, and *Amparar al Enemigo*. The *Historia de la Conquista de Mejico*, covering the three years between the appointment of Cortes to command the invading force and the fall of the city, deservedly ranks as a Spanish prose classic. It first appeared in 1684; there have been numerous reprints, the most recent being that published with notes by Revilla (Paris, 1858); an English translation by Townshend appeared in 1724. A volume of *Poesias sagradas y humanas* by Solis was published in 1692, and several unimportant letters of his may be read in the *Epistolario Español* of Rivadeneyra.

SOLOMON (Hebrew שלמה, *Shĕlōmō* for Shĕlōmōn, "man of peace"; the English form follows the Σολόμων of N. T. and Josephus; the Latin *Salomo* agrees with Σαλώμων, one of several variant forms shown in MSS. of the LXX.), son of David by Bathsheba, and his successor in the kingdom of Israel. The reign of Solomon has been sketched in ISRAEL (vol. xiii. p. 405), and his relation to the philosophical and proverbial literature of the Hebrews, the so-called *chokma*, or "wisdom," has been critically considered in the article PROVERBS. The political system of Solomon fell to pieces at his death, but the fame of his wisdom and splendour in succeeding generations was all the greater that none of his successors at Jerusalem was in a position to rival him. The many floating and fragmentary notes of various dates that have found a place in the account of his reign in the book of KINGS (*q.v.*) show how much Hebrew tradition was occupied with the monarch under whom the throne of Israel reached its highest glory; and that time only magnified in popular imagination the proportions of so striking a figure appears alike in the unfriendly picture of Solomon in the Song of Solomon (originally, it would seem, sketched in the Northern kingdom, however much it may have been retouched and overlaid by additions of later date—see CANTICLES) and in the monologue of ECCLESIASTES (*q.v.*) placed in the mouth of the wise king who had tasted all that life can offer by one of the latest writers of the Old Testament. In the apocryphal book of Wisdom, again, the composition of an Egyptian Hellenist, who from internal evidence is judged to have lived somewhat earlier than Philo, Solomon is introduced uttering words of admonition, imbued with the spirit of Greek philosophers, to heathen sovereigns. The so-called Psalter of Solomon, on the other hand, a collection of Pharisee psalms written in Hebrew soon after the taking of Jerusalem by Pompey, and preserved to us only in a Greek version, has nothing to do with Solomon or the traditional conception of his person, and seems to owe its name to a transcriber who thus distinguished these newer pieces from the older "Psalms

of David."[1] In New Testament times Solomon was the current type alike of magnificence and of wisdom (Matt. vi. 29; Luke xi. 31). But Jewish legend was not content with this, and, starting from a false interpretation of Eccles. ii. 8, gave him sovereignty over demons, to which were added (by a perversion of 1 Kings iv. 33) lordship over all beasts and birds, and the power of understanding their speech. These fables passed to the Arabs before the time of Mohammed (Nábigha, i. 22), found a place in the Koran, and gave Solomon (Suleimán) a lasting fame throughout the Moslem East. The story of Solomon, the hoopoe, and the queen of Sheba in sur. xxvii. of the Koran closely follows the second Targum to Esther i. 2, where the Jewish fables about him may be read at large. Solomon was supposed to owe his sovereignty over demons to the possession of a seal on which the "most great name of God" was engraved. See Lane, *Arabian Nights*, introd., note 21, and chap. i. note 15.

SOLOMON, SONG OF. See CANTICLES.

SOLOMON, WISDOM OF. See APOCRYPHA.

SOLOMON ISLANDS, an extensive group of islands, the largest and as yet least known of any in the Pacific Ocean, though among the very first that were discovered. They form a double chain of seven large and many small islands, extending for over 600 miles in a north-west and south-east direction between 5° S. lat., 154° 40′ E. long., and 10° 54′ S. lat., 162° 30′ E. long. The northern extremity stretches to within 120 miles of New Ireland, the south-eastern point to 200 miles west of Santa Cruz, and the nearest portion of New Guinea lies about 400 miles to the south-west of the group.[2] See vol. xix. Plate III.

The Solomon Islands vary considerably both in size and character. It is as yet doubtful which of them is the largest, but seven are from 50 to over 100 miles in length and from 15 to 30 miles in breadth; several must therefore equal the county of Cornwall in area. They are well watered, though the streams seem to be small; their coasts afford some good harbours.[3] All the large and some of the smaller islands appear to be composed of ancient volcanic rock, with an incrustation of coral limestone showing here and there along the coast. Their interior is mountainous, and Guadalcanal, where there is an active volcano, reaches an altitude of 8000 feet. Malanta and Christoval are over 4000, Ysabel and Choiseul 2000 feet high. The mountains of the latter fall steep to the sea, and the whole of its north-east portion forms an elevated wooded plain. There is some level land in Bougainville, which is also said to possess an active volcano. Every traveller has extolled the beauty and fertility of the islands. In San Christoval deep valleys separate the gently-rounded ridges of its forest-clad mountains; lofty spurs descend from the interior, and, running down to the sea, terminate, on the north, in bold rocky headlands 800 to 1000 feet in height, while, on the south, they form and shelter bays of deep water. On the small high island of Florida there is much undulating grass land, interspersed with fine clumps of trees; but patches of cultivated land surround its numerous villages, and plantations on the hill-sides testify to the richness of its soil. To the south of Choiseul lies a small cliff-girt islet, Simba (Shortland's Eddystone), with a peak ending in a crater 1200 feet high, on the side of which are a solfatara and two boiling springs. It is inhabited, and has a small safe harbour. Surgeon Guppy, late of H.M.S. "Lark," has recently made valuable geological observations in the north and south of the group. The whole chain of islands appear to be rising steadily, and traces of ancient upheaval are very general,—for instance, Treasury Island, where a coral-encrusted volcanic peak has been raised 1200 feet, and the atoll of Sta Anna, the ring of which now stands hundreds of feet above the present level of the sea. Some of the smaller islands are of recent calcareous formation. Barrier and fringing reefs, as well as atolls, occur in the group, but the channels between the islands are dangerous, chiefly from the strong currents which set through them.

The climate is very damp and debilitating. The rainfall is unusually heavy. Fever and ague prevail on the coast, but it is likely that the highlands will prove much more healthy. The dry season, with north-west winds, lasts from December to May.

A comparatively shoal sea—under 1000 fathoms—surrounds the Archipelago, and, including the New Britain and Admiralty Islands, stretches to New Guinea and thence to Australia. This sufficiently accounts for the Papuan character of its fauna, of which, however, it is the eastern limit, in spite of the fact that this shoal water extends to the extreme south of the New Hebrides. Here the strange little marsupial the cuscus (see PHALANGER) is still to be met with; the hornbill, the cockatoo, the crimson lory, and birds of a dozen other genera have already been discovered, "all," as Wallace remarks, "highly characteristic of the Moluccas and New Guinea, and quite unknown in any of the more remote Pacific islands." But, like the New Hebrides, the Solomon Islands possess a megapode (*M. brenchleyi*) which is peculiar to itself. An alligator frequents the coast, and the sea teems with fish. Insects seem to be fairly well represented. The flora has been even less studied than the zoology, but it also shows strong Papuan affinities. Vegetation is most luxuriant; unbroken tracts of magnificent forest clothe the mountains, where sandalwood, ebony, and lignum vitæ have already been found. Mangrove swamps are common on the coasts.

The Solomon Islanders, excepting those of Bellona and Rennell in the south, and Ongtong Java in the north—who are pure Polynesians—are a small sturdy Melanesian race, taller in the north than in the south, but averaging about 5 feet 4 inches for men, and 4 feet 9 inches for women. They are well proportioned, with nicely rounded limbs. Projecting brows, deeply-sunk dark eyes, short noses, either straight or arched, but always depressed at the root, and moderately thick lips, with a somewhat receding chin, are general characteristics. The expression of the face is not unpleasing. The mesocephalic appears to be the preponderant form of skull, though this is unusual among Melanesian races. In colour the skin varies from a black-brown to a copperish hue, but the darker are the most common shades. The hair is dark, often dyed red or fawn. Crisp, inclining to woolly, it naturally hangs in a mop of ringlets 3 to 8 inches in length; but, when carefully tended, it forms one smooth bush—the usual fashion for both sexes. Epilation is practised; little hair, as a rule, grows on the face, but hairy men are not rare.[4] Skin diseases are prevalent.

The Solomon Islanders are intelligent, of a quick and nervous temperament, crafty, thievish, and revengeful, yet, quickly amenable to good treatment, they make faithful servants. They are fond of dancing; their music is a monotonous chant with an

[1] The most ancient tradition, that of the LXX., gives Solomon no part in the authorship of the canonical psalter; see vol. xx. p. 29.

[2] *Islands of the Archipelago.*—The larger are—in the eastern chain, Bougainville, Choiseul, Ysabel, Malanta, and in the western chain, New Georgia, Guadalcanal (often misspelt Guadalcanar), San Christoval. The smaller are—Buka (the most northern), Shortland, Treasury, Faro, Simba (Eddystone), Rubiana, Hammond, Marsh, Savo, Buona Vista, Anuda, Ngela (Florida), Ulawa (Contrariété), Ugi, Three Sisters, Sta Anna, Sta Catalina, Bellona, Rennel (the most southern). Mendaña mentions seeing near Buena Vista a small island in a state of violent eruption; he named it Sesarga. Ongtong Java is a group of coral islands in the north-east, but it does not, geographically, form part of the group.

[3] Blanche Bay, Bougainville; Port Praslin, Ysabel; Marovo, New Georgia; Port Wiseman, Florida; Curaçoa Harbour in Marau Sound, Guadalcanal; Recherche Bay, Makira Bay, and Vanga Harbour, San Christoval.

[4] On the islands in Bougainville Strait tribes with lank, almost straight, black hair and very dark skin are found. The mountains of the large islands seem to be thinly inhabited by a smaller and ruder race, with whom the coast tribes wage perpetual war and for whom they express great contempt.

accompaniment of bamboo drums. They make pan pipes and jew's harps. Of their religion and manners and customs very little is known. Their language is of pure Melanesian type though a number of dialects are spoken throughout the group,—many even on the same island. Broken into numerous clans, they are rarely at peace with each other; but the attention bestowed on plantations proves them good agriculturists. Yams, arum-roots, bread-fruit, cocoa nuts, and fish constitute the chief of their food. Pigs, dogs, and fowls are also eaten, and, as these are mentioned by Mendaña, they must have been known in the islands for over three hundred years. The islanders are great betel chewers, but little palm arrack or kava seems to be drunk. The respect paid to chiefs and elders varies in different islands. They are cannibals, though to what extent is unknown. Trophies of human skulls are common, and preserved heads—the face inlaid with shell—have been procured in Guadalcanal and Rubiana. They are said to pay honour to departed spirits. Carvings representing both men and animals often form the posts of houses and sheds, and adorn the prows of canoes. Their houses are square or oblong, strongly built, with high projecting roofs, which sometimes, as in their canoe-sheds, almost reach to the ground. The floor-mats are very rough. Large halls and spirit-houses exist in some of the villages, and great care and skill are bestowed on their decoration.[1] Great nicety of finish characterizes their weapons. They are mostly light and graceful, and consist of bows and arrows, spears, and clubs; the sling seems unknown. Some of the spears have the barbed head carved out of a human leg or arm bone; others, if not cut out of the solid wood, have bones, thorns, or splinters of wood attached in a most masterly manner. Arrows are similarly fashioned, and their reed shafts ornamented with incised lines. None of them appear to be poisoned. The bows, often large and powerful, are made of palm-wood or a strip of bamboo. Clubs vary considerably in shape; their butts are sometimes covered with finely-plaited coloured grass. Some, which are long and slight, are sickle- or scythe-like, others lanceolate or spoon shaped; and some, smaller, resemble a very broad dagger. This is, in the Pacific, the eastern limit of the shield. It is an unknown weapon in the other islands —Melanesian as well as Polynesian,—but to the west, in the New Britain group, and in New Guinea, various forms of it occur, whence, through the Malay islands, it may be traced back to the Asiatic continent. The shield is also used by the Australians. That of the Solomon Islanders is made of reeds, and is of an oval or oblong form. Their canoes are built of planks sewn together and caulked, and are the most beautiful in the Pacific. They are very light, slim, and taper, 20 to 60 feet in length, with 1 to 3 feet beam, but they balance so well that an outrigger is dispensed with. The high carved prow and stern—which are said to act as a shield from arrows when stem on—give the craft almost a crescent shape. These and the gunwale are tastefully inlaid with mother-of pearl and wreathed with shells and feathers. Sails are not used, but the narrow pointed paddles propel the canoes with great speed through the water.[2] Graceful bowls, with some bird or animal for model, are also made. They are cut out of the solid, and sometimes measure over 8 feet in length. Stone adzes appear to be now used only in the interior and in the north of the group. They are well ground, flat and pyriform in shape, and very different from any made in the neighbouring groups of islands. Clothing is of the scantiest. Both men and women not unfrequently go naked; but, as a rule, some slight covering is worn, and neatly made fringed girdles are used in some districts. Tattooing and scarring of the body is but slightly practised. Ornaments are used in profusion, and often are very tasteful. Carved wooden belts, coloured shell-bead bands, and a variety of armlets, combs, and feather head-dresses are worn, also shell disks covered with tortoise-shell fretwork. Necklaces of teeth and shell are common and multiform; one much prized is made of human incisors. The ears, and, in men, the septum of the nose, are pierced,—frequently, also, the cartilage of one or both nostrils. In these the strangest ornaments are inserted, such as tortoise-shell rings, bones, teeth, shells, crab-claws, and the like.[3]

History.—The Spanish navigator Mendaña must be credited with the discovery of these islands, though it is somewhat doubtful whether he was actually the first European who set eyes on them. He sailed from Callao in 1567, by command of the governor of Peru, to discover the southern continent, the presumed existence of which in the then unknown region between America and Asia had already given rise to much speculation; but he seems to have been strangely unfortunate. Sailing west he discovered only a few coral islets (? Ellice group) until, having crossed more than 7000 miles of ocean, he fell in with an archipelago of large islands. By their size and position he considered them to form part of the land he was in search of, and in pleasing anticipation of their natural riches he named them Islas de Salomon. The expedition surveyed the southern portion of the group, and named the three large islands San Christoval, Guadalcanal, and Ysabel. On his return to Peru Mendaña endeavoured to organize another expedition to colonize the islands, but it was not before June 1595 that he, with Quiros as second in command, was enabled to set sail for this purpose. The Marquesas and Santa Cruz Islands were now discovered; but on these latter islands, after various delays and troubles, Mendaña died, and the expedition eventually collapsed.

Even the position of the Solomon Islands was now veiled in uncertainty, and they were quite lost sight of until, in 1767, two centuries after their first discovery, Carteret lighted on their eastern shores at Gower Island, and passed to the north of the group, without, however, recognizing that it formed part of the Spanish discoveries. In 1768 Bougainville found his way thither. He discovered the three northern islands (Buka, Bougainville, and Choiseul), and sailed through the channel which divides the latter two. In 1769 Surville explored the east coast, and was the first, in spite of the hostility of the natives, to make any lengthened stay in the group. He brought home some detailed information concerning the islands, which he called Terres des Arsacides; but their identity with Mendaña's Islas de Salomon was soon established by French geographers. In 1788 Shortland discovered New Georgia, with some of the smaller islands; and in 1792 Manning sailed through the strait which separates Ysabel from Choiseul and now bears his name. In the same year, and in 1793, D'Entrecasteaux surveyed portions of the coast line of the large islands. In 1794 Butler visited the group, and Williamson in the "Indispensable" explored the channels which divide Guadalcanal from San Christoval and Ysabel from Malanta. There was a break of nearly half a century before D'Urville in 1838 took up the survey.

Traders now endeavoured to settle in the islands, and missionaries began to think of this fresh field for labour, but neither met with much success, and little was heard of the islanders save accounts of murder and plunder perpetrated by them. In 1845 the French Marist fathers went to Ysabel, where Mgr Epaulle, first vicar apostolic of Melanesia, was killed by the natives soon after landing. Three years later this mission had to be abandoned; but since 1881 work has again been resumed. In 1856 John Coleridge Patteson, afterwards bishop of Melanesia, paid his first visit to the islands, and native teachers trained at the Melanesian mission college have since established themselves there, as well as a few traders. About this date the yacht "Wanderer" cruised in these seas, but her owner was kidnapped by the natives and never afterwards heard of. In 1873 the "foreign-labour" traffic in plantation hands for Queensland and Fiji extended its baneful influence from the New Hebrides to these islands. Noteworthy recent visits are those of H.M.S. "Curaçoa" in 1865, H.M.S. "Blanche" and Mr C. F. Wood's yacht in 1872, the German war ship "Gazelle" in 1876, and H.M.S. "Lark" in 1881–84.

SOLON. The legislation of the Athenian Solon, which to a large extent moulded the subsequent political life of Athens, belongs to the early part of the 6th century B.C.[4] It followed almost immediately on an unsuccessful attempt to overthrow the government of the aristocratic families of Attica, one of which, however, that of the Alcmæonids, was driven into exile; and it preceded by a short interval the famous usurpation of Pisistratus. Solon had won the confidence of his fellow-citizens by having recovered for them the island of Salamis, close to the shores of Attica, an old and valued possession, which their neighbours of Megara had taken from them. Solon, himself a native of Salamis, encouraged them to fight once again for the "lovely island," as he called it, in a short poem which he publicly recited, feigning, it is said, the excitement of a madman. Through Spartan intervention in the war between Athens and Megara Salamis was restored to the Athenians, and Solon had the credit of the result. In

[1] See frontispiece to Brenchley's *Curaçoa*.

[2] Rude outrigger canoes with mat sails are used in some parts of the archipelago.

[3] Of the island manufactures fine specimens may be seen in the British, Cambridge, and Maidstone museums.

[4] The dates of his birth and death are approximately 638 and 559.

594 B.C. he was summoned under the constitutional title of "archon" to undertake the work of sweeping political reforms, which, in consequence of bitter party strifes and the poverty and indebtedness of the small farmers or proprietors of Attica, were sorely needed. The Athenian like the Roman debtor had often sunk, under the legalized oppression of his creditor, into an actual slave, and had from time to time been sold and exported. Many poor creatures had fled away from home, and were supporting themselves by the labour of their hands in foreign countries. Many men who still clung to their little properties could, with all their pinching, barely keep their heads above water. The governing classes themselves felt that a crisis was at hand, and they appealed to Solon and made him practically dictator. Had he chosen to work on the popular discontent, he might have easily crushed the aristocracy and become a despot, or, as the Greeks called it, a tyrant, as many had done in other states of Greece by coming forward as champions of the people against the great ruling families. Solon obeyed a nobler impulse and aimed at saving his country without too violent a revolution. His first step was to give immediate relief to the poor debtor, to the wretchedly impoverished small farmer or proprietor, and to interpose between him and his creditor and landlord. On very many of the little properties of Attica were to be seen stone pillars with the name of the mortgagee and the amount of the mortgage inscribed on them. By a relief law, "a shaking-off of burdens" (σεισαχθεία), he annulled all mortgages, justifying no doubt so extreme a measure by the harshness of the contracts imposed by mortgagees on needy tenants and proprietors and by the urgent necessity of prompt release for the multitude of such small debtors. Thus the "mortgage pillars" were swept away and the land was once more free. Such a setting aside of the rights of property, expedient as it may have been under circumstances of acute public distress, must have inflicted a heavy loss on the wealthier class, and the landlord and the mortgagee would also have a fair claim for relief. This, it appears, Solon accomplished by a device which has been variously explained, a depreciation of the currency which relieved to a considerable extent—27 per cent., according to Grote's[1] calculation—the wealthier debtors of the landlord and mortgagee class. Grote here remarks that, had Solon cancelled all debts and contracts, there would have been no need to interfere with the currency and lower the standard of money. His relief law could not have been so sweeping and revolutionary as it has sometimes been represented. There was no redistribution or confiscation of the land, no universal remission of debts. For the great majority of the people indeed there was substantial relief. The land was free from incumbrance, and the small cultivator had a fresh start in life; there was no imprisonment or slavery for the debtor; and it would seem that debtors who had sought refuge abroad were purchased back and restored to their homes. Such on the whole appears to have been the character of Solon's first great reform, though some of the details remain obscure. The reconstruction of the political system on the principle that every citizen was to have a share in the government was Solon's next work. A few noble families, Eupatrids, as they were called, had hitherto had all the power in their own hands. Solon made property the measure of political power, and confined the higher offices of state to the wealthiest citizens; but election to these offices was to be made by the whole body of the people, the tenure of office was limited as to time, and an account had to be rendered publicly as to its exercise. The citizens were distributed into four classes according to a graduated scale of property, the first class being alone eligible to the archonship or highest office and to military and naval commands. The actual administration of public affairs was thus restricted to the wealthy few. The second class were the knights or horsemen—the men who could keep a war-horse for the service of the state; these were assessed at three-fifths of the amount of the first class. The third class answered to our yeomen, and had to serve as heavy-armed infantry. These three classes were subject to direct taxation in the form of a graduated income tax, which was, however, simply an extraordinary tax, levied only in special emergencies at varying amounts per cent. on a citizen's rateable property, as set down in a public schedule. The fourth and lowest and most numerous class, which supplied light troops and sailors for the fleet, was exempt from all direct taxation, but paid indirect taxes; it would be made up of small farmers, tradesmen, and artisans, and consist in fact of quite the poorest and humblest class of citizens. Its members could not hold any office; but they had a large amount of political power through their votes in the popular assembly which elected the magistrates and called them to account, and through the very great judicial powers with which they were intrusted, and in virtue of which the Athenian juror practically decided questions both of fact and of law. Solon's constitution thus gave the people ample means of protecting themselves from misgovernment and oppression, every magistrate being directly responsible to them. Not that Solon himself contemplated anything like pure democracy; there is every reason to believe he shrank from it; but pure democracy was pretty sure to follow as soon as the people distinctly realized their power. Solon's council of 400, taken exclusively from the first three classes, must have been meant to furnish the popular assembly with political guidance, and this it did by preparing and introducing measures for discussion and superintending its meetings and exercising some direction over its proceedings. It is impossible for us to define its peculiar functions precisely. It was, however, ultimately under the control of the popular assembly, by which probably it was annually elected, and to which it had annually to render an account. We are not to suppose that either the council or the popular assembly originated with Solon. What he really did was to put them on a new footing, and to the latter, which previously in all probability had hardly any weight or influence, he gave greatly enlarged powers. The archons and magistrates and the council itself were elected by the popular assembly, and were responsible to it for good behaviour during their term of office. In this assembly met the citizens of all four classes, and consequently the great majority of its members would be poor men and almost peasants. The voting was by show of hands; every voter was allowed to speak; and in the voting there was no distinction of classes, all being on a perfectly equal footing. Although theoretically they could not originate any measure, but had to accept for discussion what had been prepared for them by the council, they had an absolute power of veto, and, as the election of the council was in their hands, it must have been easy for them to get that body to bring forward any proposal which they might wish to discuss. Thus it may be truly said that Solon laid the foundation of the future democracy. And through the Heliæa, as it was called,—a body of 6000 citizens annually elected by lot to act as jurors for the trial specially of political offences,—the people acquired a complete control over public affairs. There was but one proviso: the Athenian juror must be upwards of thirty years of age. In the Athenian courts which were formed out of these 6000 citizens the functions of judge and jury

[1] *History of Greece*, ch. xi.

were united in one and the same person, and political questions were continually decided when, as often happened, a citizen was put on his trial for some alleged illegal or unconstitutional proposal. By such means popular rights and privileges were effectually protected, and the democratic character of the constitution enlarged and confirmed, as we see in the subsequent history of Athens. Solon, indeed, retained (he did not create) the famous senate of the Areopagus, and aimed at making it respected and capable of exercising a general superintendence over the morals and social life of the citizens. It was to be an aristocratic body, consisting only of archons who had acquitted themselves well and honourably during their year of office. It seems that he did not attempt to prescribe to it any special or particular duties, but that he rather trusted to its making its influence felt from the fact that it was, as every one knew, composed of men of acknowledged merit and ability. Consequently, as Thirlwall observes (*Hist. of Gr.*, ch. xi.), "it could only exercise its powers with advantage as long as it retained the confidence of its fellow-citizens; when that was lost it became time that its legal authority should cease." Solon evidently felt that, for a time at least, there must be checks on popular government. Had it been hinted to him that under his constitution power must finally drift down to the lowest social stratum, he would perhaps have replied that he had endeavoured to supply the entire people with a political training which should by degrees qualify them for absolute self-government.

Solon encouraged commerce and manufacturing industry, and drew a number of settlers from foreign parts to Athens, on condition of their paying an annual tax and putting themselves under the protection of a citizen who was to be their legal representative—their "patronus," according to Roman phrase. These settlers (μετοίκοι, "metics") had none of the political privileges of the Athenian citizen, and they could not acquire landed property. Many of them, however, flourished and grew rich, and had every reason to be satisfied with their position, which, in a kindly and tolerant community like that of Athens, was continually improving. Solon, too, like all the legislators of antiquity, endeavoured to regulate every department of life, compelling the attendance of the youths from sixteen to eighteen at the public gymnastic schools, and requiring them to serve the next two years on garrison duty. Restraints were put upon women as to their appearance in public, and even as to their mourning at funerals. Solon's punishments were for the most part rather lenient, and indicated a humane and generous temper. It is of course not to be supposed that all the details of his legislation were maintained, but they undoubtedly left their mark on the Athenian character.

Having done his work, Solon left Athens and travelled for ten years in Egypt, Cyprus, and Asia, gathering fresh stores of knowledge for himself and giving counsel to others. One would like to believe the beautiful story Herodotus tells of his interview with Crœsus, king of Lydia, whom he warned with the memorable saying that "we must not pronounce any man happy till we have seen his end." Unfortunately, Crœsus did not begin to reign till several years after Solon's travels, and with Grote we must be content to take the story as merely an "illustrative fiction." On his return to Athens in his old age he found the old feuds once more raging, and Pisistratus, his kinsman, and his friend in past days, intriguing for power. The two men had, it seems, a sincere respect for one another, but Solon protested against the complete surrender of the government to Pisistratus, the danger of which he publicly pointed out, though without effect. The crisis ended in the rule, in many respects an enlightened and beneficent rule, of Pisistratus and his sons, of which Solon lived only to see the first beginning. He died, soon after having made his honourable protest, at the age of eighty, leaving behind him the good effects of a work which only a man of rare intelligence and wide sympathies could have accomplished. He was something of a poet, and several fragments of his poems, written generally with a practical purpose, have come down to us, and throw light on his political aims and sentiments.

Grote and Thirlwall in their histories of Greece give a full account of Solon's legislation. Plutarch's life of Solon, not a very critical performance, is our chief original authority. (W. J. B.)

SOLOTHURN. See SOLEURE.

SOMÂLI, SOMÂL, a Hamitic people of east Central Africa, mainly confined to the eastern "horn" of the continent, which from them takes the name of Somâli Land, probably the Punt of the Egyptian records. Here they are conterminous towards the north-west with the kindred Afars (Dankali), and elsewhere with the more closely related Gallas, from whom they are separated on the south-west by the river Juba. Tajurra Bay, with the lower course of the Hawash, is usually given as the north-west frontier; but, according to the recent explorations of Abargues de Sostén in eastern Abyssinia, there appears to be here an overlapping of the three peoples, the Isa Somâli encroaching on the Afar domain north of Tajurra Bay nearly to the parallel of Asab Bay (13° N.), while the Dawari Gallas penetrate between this Somâli tribe and the lower Hawash eastwards to the coast at Obok (12° N.). A line drawn from the Strait of Bab-el-Mandeb through the Harrar district and the headwaters of the Haines river (Webbe-Shebeyli or "Leopard river") southwards to the equator at the mouth of the Juba will roughly define the landward frontier of the Somâli territory, which is elsewhere sea-girt,—by the Gulf of Aden on the north, by the Indian Ocean from Cape Guardafui to the equator.

Our first contact with the Somâli people may be said to date from the English occupation of Aden in 1839. But, notwithstanding the early visits of Cruttenden, Ch. H. Johnston, Captain Burton, and one or two others, very little was known about them before the seizure of Berberah by the Egyptians in 1874. This event led to the establishment of permanent relations with the coast tribes, and was followed by several excursions into the interior, of which the most fruitful in results have been those of Sacconi, Revoil, F. L. James, Paulitschke, Von Hardegger, and Josef Menge, the last three bringing our information down to the year 1885. From the reports of these observers the true relations of the Somâli have been gradually determined, and we now know that they form a distinct branch of the eastern ("Ethiopic") Hamitic stock, of which the other chief members are the neighbouring Gallas and Afars, the Abyssinian Agau, and the Bejas (Bishari) of the steppe lands between the Nubian Nile and the Red Sea. Their close affinities both in physical type and in speech with the surrounding Gallas are obvious, and like them they are described as a fine race,[1] tall, active, and robust, with fairly regular features, but not free from an infusion of Negro blood, as shown both in their dark, often almost black complexion, and still more in their kinky and even woolly hair, sometimes short, sometimes long enough to be plaited in tresses hanging down to the shoulders.[2] Like

[1] Captain Wharton, who has been recently surveying the Somâli seaboard, describes the coast tribes near the equator as "the handsomest race of men and women he had ever seen," black in colour, but with magnificent physique (*Proc. Roy. Geog. Soc.*, Oct., 1885). Captain F. M. Hunter also describes them as a tall, fine looking people, with oval face, high rounded forehead, full lips, strong regular teeth, bright restless eye, but lower limbs seldom well developed (*A Grammar of the Somal Language*, Bombay, 1880).

[2] The occasional presence of "steatopyga" (Topinard) shows that all these features are undoubtedly due to Negro intermixture.

the Gallas also they are still in the tribal state, broken up into an endless number of clans and septs, variously grouped by different writers According to Captain Guillain[1] there are three main divisions—the Aji on the north and north-east coast, the Hawiya on the south-east coast, and the Rahhanwin in the interior But these are reduced by James to two, Isak and Darode (apparently the Edur and Darrud of older observers), with several main branches as under —

Isak	Habr Gerhaji, south from Berberah, beyond the coast range
	Habr Tjaleh, east from Berberah, north of the coast range
	Habr Awál, Berberah district
Darode	Mejertain, east coast from Guardafui to 4° north
	Dolbohanti, Nogal River
	Warsangueli, north coast, west from Guardafui
	Marehan, between the Mejertain and Ogadain
	Ogadain, Webbe basin, and widespread in interior

To these, however, must be added the powerful Gadabirsi west from Berberah and the Isa (Issa) of the Hawash basin, besides the three low-caste tribes dispersed amongst the others,—Tomal (ironworkers), Ebir (dealers in charms), and Midgan (ostrich breeders)

The Somâli, who are mainly Mohammedans of a somewhat fanatical type, are a fierce lawless people, impatient of control, and yielding a reluctant obedience even to their own rulers Hence the tribal chiefs enjoy little more than a nominal authority, although some of the more powerful amongst them affect the title of sultan At present the great Habr Gerhaji nation appears to be split into two sections, each under a chief claiming this rank All go armed with spear, shield, and short sword, the latter exactly like that of the ancient Egyptians, whom the Somâli are otherwise said to resemble more than any other African people The weapons are freely used in their disputes, although the tribal laws against homicide are severe, heavy fines of camels or other property being imposed, which must be paid either by the criminal or the community They are great talkers, keenly sensitive to ridicule, and quick-tempered, although amenable to reason if they can be induced to argue the point According to the character of the soil and climate they live a settled or nomad life, in some places breeding numerous herds of camels, goats, and fat-tailed sheep, in others growing large crops especially of durrah, or collecting the gums—frankincense and myrrh—for which the land has always been famous The Marehan (properly Murreyhan) tribe is said to have given its name to the myrrh, which is obtained in the greatest perfection in their district, although the term seems too old to admit of this derivation, and is more probably connected with a Semitic root *mar*, *mur* = bitter Through the ports of Berberah and Zeyla, a considerable export trade to Arabia, Egypt, and India is carried on with these articles and the other natural products of the country, such as hides, horns, ostrich feathers, coffee of a very fine quality, indigo, salt But the natives take little part in this movement, which from remote times has been in the hands of the Indian banians settled at various points on the coast In 1879–80 the total value of the exports was estimated at about £140,000

Like many other Mohammedan peoples, the Somâli claim Arab descent, their progenitor having been a certain Sherif Ishak b Ahmad, who crossed over from Hadramaut with forty followers about five hundred years ago Other traditions go farther back, tracing their origin to the Himyaritic chiefs Sanhâj and Samamah, said to have been coeval with a King Afrikus, who is supposed to have conquered Africa about 400 A D These legends should perhaps be interpreted as pointing at a series of Arab immigrations, the last two of which are referred to the 13th and 15th centuries But these intruders seem to have been successively absorbed in the Somâl stock, and it is remarkable that the Arabs never succeeded in establishing permanent settled or nomad communities in this region, as they have done in so many other parts of the continent Their influence has been very slight even on the Somâl language, whose structure and vocabulary are essentially Hamitic, with marked affinities to the Galla on the one hand and to the Dankali (Afar) on the other Captain Hunter's *Grammar*, with exercises and vocabularies (Bombay, 1880), utilizing the materials published by General Rigby in the *Proceedings* of the Bombay Geographical Society (1849), is the only comprehensive treatise on the language, which appears to be spoken with great uniformity throughout the whole of Somâli Land Hunter mentions an eastern and a western dialect, differing, however, but little from one another, which is the more remarkable that there is no written standard and little oral literature, beyond some proverbial sayings, short stories inculcating certain moral teachings, and some simple love-songs Although the rhythm is defective, these chants are not lacking in poetical ideas, and often betray an unexpected refinement of feeling not inferior to that of similar compositions amongst more civilized peoples (A H K)

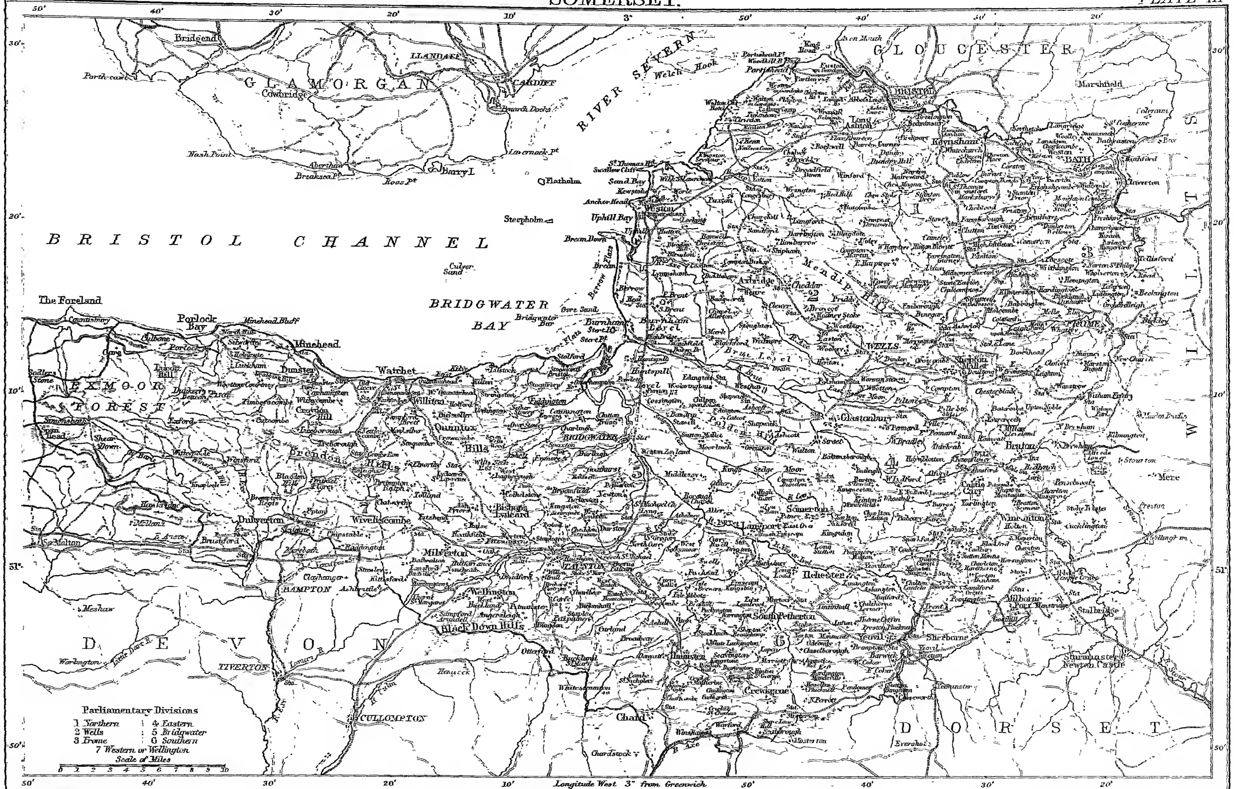
SOMERS, JOHN (1652–1716), was born on March 4, 1652, at Worcester,—the eldest son of John Somers, an attorney in large practice in that town who had formerly fought on the side of the Parliament, and of Catherine Ceaverne of Shropshire After being at school at Worcester he was entered as a gentleman commoner at Trinity College, Oxford, and afterwards studied law under Sir Francis Winnington, who became solicitor-general, and joined the Middle Temple He appears, in addition to his legal studies, to have written several poems and pamphlets He soon became intimate with the leaders of the country party, especially with Essex, Russell, and Algernon Sidney, but never entered into their plans so far as to commit himself beyond recall He was the author of the *History of the Succession of the Crown of England, collected out of Records, &c*, and was reputed to have written the *Just and Modest Vindication of the Two Last Parliaments*, which was put forward as the answer to Charles II 's famous declaration of his reasons for dissolving them This, however, was by Sidney, though probably Somers was responsible for the final draft When the grand jury of Middlesex threw out the bill against Shaftesbury, and were vehemently attacked for so doing, Somers wrote in defence of the rights of grand juries In 1683 he was counsel for the sheriffs Pilkington and Shute before the Court of King's Bench, and secured a reputation which continually increased until the trial of the seven bishops, in which he was junior counsel "Somers rose last He spoke little more than five minutes, but every word was full of weighty matter, and when he sat down his reputation as an orator and a constitutional lawyer was established " In the secret councils of those who were planning the revolution Somers took a leading part, and in the Convention Parliament was elected a member for his native town He was immediately appointed one of the managers for the Commons in the conferences between the Houses, and in arguing the questions whether James II had left the throne vacant by abdication and whether the Acts of the Convention Parliament were legal—that parliament having been summoned without the usual writs—he displayed great learning and legal subtlety He was further distinguished by being made chairman of the committee which drew up the celebrated Declaration of Right On May 9, 1689, Somers was made solicitor-general He now became William III 's most confidential adviser In the controversy which arose between the Houses on the question of the legality of the decision of the Court of King's Bench regarding Titus Oates, and of the action of the Lords in sustaining this decision, Somers was again the leading manager for the Commons, and has left a clear and interesting account of the debates He was next employed in January 1690 as chairman of the select committee of the House of Commons on the Corporation Bill, by which those corporations which had surrendered their charters to the crown during the last two reigns were restored to their rights, but he refused to associate himself with the violent measures of retaliation which the Whigs on that occasion endeavoured to include in the bill In April a speech by him carried through the Lower House, without opposition, the bill which declared all the laws passed by the Convention Parliament to be valid As solicitor-general he had to conduct the prosecution of Preston and Ashton in 1691, and did so with a moderation and humanity which were in marked contrast to the customs of the former reigns He was shortly appointed attorney-general, and in that capacity strongly



ENCYCLOPÆDIA BRITANNICA, NINTH EDITION

J. Bartholomew

opposed the bill for the regulation of trials in cases of high treason. On March 23, 1693, the great seal having meanwhile been in commission, Somers was appointed lord-keeper, with a pension of £2000 a year from the day on which he should quit his office, and at the same time was made a privy councillor. He had previously been knighted. Somers now became the most prominent member of the Junto, the small council which comprised the chief members of the Whig party. When William left in May 1695 to take command of the army in the Netherlands, Somers was made one of the seven lords-justices to whom the administration of the kingdom during his absence was entrusted, and he was instrumental in bringing about a reconciliation between William and the princess Anne.

The question of improving the currency now became pressing, and Somers was the author of the bold suggestion that a proclamation should be issued simultaneously all over the kingdom, announcing that henceforth all clipped and hammered coins were to be reckoned only by weight. But all possessors of such coins might, by delivering them up on a certain day, receive a note entitling them to draw from the treasury at a future time the difference between the actual and nominal values. The difficulties of the plan, however, rendered its adoption impossible. In April 1697 Somers was made lord chancellor, and was created a peer by the title of Baron Somers of Evesham. When the discussion arose on the question of disbanding the army, he summed up the case against disbanding, in answer to Trenchard, in a remarkable pamphlet called "The Balancing Letter." In August 1698 he went to Tunbridge Wells for his health. While there he received the king's letter announcing the first Partition Treaty, and at once replied with a memorandum representing the necessity in the state of feeling in England of avoiding further war. When the king, on the occasion of the Disbanding Bill, expressed his determination to leave the country, Somers boldly remonstrated, while he clearly expressed in a speech in the Lords the danger of the course that was being taken. Hitherto Somers's character had kept him free from attack at the hands of political opponents; but his connexion in 1699 with the notorious Kidd, who, being sent out to put down the pirates in the Indian Ocean, turned pirate himself, and to the defraying of whose expedition Somers had given £1000, afforded an opportunity; the vote of censure, however, proposed upon him in the House of Commons for giving Kidd a commission under the great seal was rejected by 199 to 131. The attack was renewed shortly on the ground of his having accepted grants of crown property to the amount of £1600 a year, but was again defeated. On the subject of the Irish forfeitures a third attack was made in 1700, a motion being brought forward to request the king to remove Somers from his counsels and presence for ever; but this again was rejected by a large majority. In consequence, however, of the incessant agitation, William now requested Somers to resign; this he refused to do, but gave up the seals to William's messenger. In 1701 he was impeached by the Commons on account of the part he had taken in the negotiations relating to the Partition Treaty in 1698, and defended himself most ably before the House, answering the charges *seriatim*. The impeachment was voted and sent up to the Lords, but was there dismissed. On the death of the king Somers retired almost entirely into private life. He was, however, active in 1702 in opposing the Occasional Conformity Bill, and in 1706 was one of the managers of the union with Scotland. In the same year he carried a bill regulating and improving the proceedings of the law courts. He was made president of the council in 1708 upon the return of the Whigs to power, and retained the office until their downfall in 1710. From this time his powers of mind rapidly declined, and after being almost imbecile for six years he died of apoplexy on April 26, 1716. Somers was never married, but left two sisters, of whom the eldest, Mary, married Charles Cocks, whose grandson, Sir Charles Cocks, Bart., became the second Lord Somers in 1784.

For a contemporary character of Somers Addison's paper in the *Freeholder* for May 14, 1716, should be referred to; and there is in Macaulay's *History* (vol. iv. p. 53) an eloquent and worthy tribute to his stainless character and comprehensive learning. A catalogue of his publications will be found in Walpole's *Royal and Noble Authors*. (O. A.)

SOMERSET, a maritime county in the south-west of England, bounded E. by Wiltshire, S.E. by Dorset, S.W. and W. by Devonshire, N.W. by the Bristol Channel, and N. by Gloucestershire. The total area of land and water is 1,049,815 acres or 1640 square miles. Plate III.

The shape of the county is determined by the nearly rectangular bend taken by the coast not far from Bridgwater. It falls into three natural divisions, which answer remarkably to the three waves of West-Saxon conquest and to the parliamentary divisions as they stood till the latest changes. The range of Mendip, breaking off from the high ground in the east of the county, completely shuts off the northern part, between Mendip and Bristol, itself hilly. Mendip itself, running slightly north-westward towards the Channel, has for its summit a tableland sloping much more gently to the north than to the south. Its most striking though not its highest points are towards the Channel, where it ends in the promontory of Brean Down, while the Steep Holm stands as an outpost between the hills of Somerset and those of Glamorgan. The sides of Mendip are broken by many passes or *combes*, the most marked of which are Ebbor rocks near Wells and the greater pass of Cheddar cliffs, whose varied outlines, in the many turns of the pass, are probably the most noteworthy of their kind in England. Between Mendip and the region of loftier hills in the south lies a great alluvial plain, known generally as Sedgemoor, but with different names in different parts. This plain, intersected by ditches known as *rhines*, and in some parts rich in peat, is broken by isolated hills and lower ridges, of which the most conspicuous are Brent Knoll near Burnham, the Isle of Avalon, rising with Glastonbury Tor as its highest point, and the long low ridge of Polden ending to the west in a steep bluff. In the south is Blackdown on the border of Devonshire, the higher range of Quantock (highest point 1262 feet) stretching to the sea, and to the west again the mountainous region of Brendon and Exmoor, commonly believed by tourists to be part of Devonshire. Here are hills of much greater height and bolder outline, the highest point being that of Dunkery (1709 feet) above Porlock. The two principal rivers are the Lower Avon and the Parret. The Avon, after forming for a short distance the boundary with Wilts, crosses the north-eastern corner of the county, encircling Bath, and forms the boundary with Gloucestershire till it reaches the sea 6 miles beyond Bristol. It is navigable for barges as far as Bath. The Parret from South Perrott in Dorset, on the borders of Somerset, crosses the centre of the county north-westwards by Bridgwater, receiving the Ivel or Yeo and Cary on the right, and the Isle and Tone on the left. Among other streams are the Axe, which rises at Wookey Hole in the Mendips and flows north-westward along their base to the Bristol Channel near Blackrock; the Brue, which rises to the east of Bruton, near the borders of Wiltshire, and enters the Bristol Channel near the mouth of the Parret; and the Exe (with its tributary the Barle), which rises in Exmoor forest and passes southward into Devon.

The diversified surface of the county is accounted for by the variety and complexity of its geological structure The Old Red Sandstone, composed of sandbanks and mud-banks of a land-locked lake, is met with in the Mendip Hills and on the banks of the Avon, but presents no feature of importance The Devonian rocks, after plunging beneath the Triassic strata of the low ground between Williton and Taunton, rise again to the surface in the well-wooded Quantock Hills The Carboniferous strata occupy a considerable area between Bristol and the Mendip Hills, forming a portion of the Bristol and Somerset coal-field The Carboniferous limestone, built up mainly of petrified shells and corals, forms a truncated arch in the Mendip Hills, which owe their steepness and rugged contours to its compact and jointed structure, and their ravines and caves to atmospheric influences and to streams acting on the formation at and below the surface It overlaps to the south the plain of Somerset, and plunges northwards under the coal-measures and Triassic rocks, reappearing in isolated and picturesque masses The coal-measures, which have a thickness of about 7000 feet, include an upper and a lower series, separated by beds of grit about 2000 feet in thickness, also containing beds of coal (see COAL, vol vi p 52) It is supposed that similar beds underlie the marshes to the south at a depth of from 1000 to 1200 feet A large portion of the Carboniferous rocks are covered unconformably with the New Red Sandstone and Liassic and Oolitic strata Triassic rocks prevail over the whole western area, from the Mendips to Exmoor The highly fossiliferous Rhætic strata rest on the grey marls of the Trias, and constitute the lower part of the bold scarp of the Lias limestone and clays of the ranges from the sea to the Poldens Plunging beneath the Oolitic strata, they occupy a large but scattered area in the east between Yeovil and Bath, and these in their turn pass under the Cretaceous strata of the serried Black-down Hills A large extent of the county is occupied by alluvial deposits Caves are common in the body of the hills, among which the greatest are the bone cave near Banwell, the stalactite caves at Cheddar, and Wookey Hole Hard by the last-named is the hyæna cave discovered in 1852, and explored in 1857–63, when, besides animal remains belonging to a great variety of species, flint and chert implements were also discovered

Minerals —Though the exposed area of the coalfield of Somerset is only about 14 square miles, it is estimated to extend over 238 square miles The amount of coal raised within the county in 1884 was 843,437 tons, valued at £295,202 Spathose iron ore has been long worked in the Brendon Hills, but the industry is declining,—26,041 tons, valued at £13,021, having been obtained in 1858 and only 3582 tons, valued at £2619, in 1884 Lead mining has been carried on in the Mendips from time immemorial, but the industry is of much less importance than it was in earlier times, the amount of dressed lead ore obtained in 1884 being only 664 tons, of lead obtained in smelting 178 tons, of silver obtained from the lead 2760 ounces, and the value of the ore at the mines £1055 Next to coal the most important mineral production is freestone from the Oolitic strata, the largest quarries being in the neighbourhood of Bath Copper and manganese are obtained in small quantities, as well as fuller's earth, marl, cement from the Lias, and ochre

Railways —The county is so completely intersected by branches of the Great Western Railway in the north and west, and of the South Western in the south and east, that there is perhaps no hamlet more than seven miles from a railway station

Manufactures —Woollen and worsted goods are manufactured in a large number of towns, silk at Frome, Taunton, and Shepton Mallet, gloves at Yeovil, Taunton, and other places, crape at Dulverton and Shepton Mallet There are large potteries at Bridgwater and Weston-super-Mare, at the former town and at Bath there are extensive carriage-works, and there are paper-mills on several of the streams Most of the commerce of the county passes through Bristol, which is situated mainly in Gloucestershire

Agriculture —In the hilly districts much of the land is uncultivated and barren, although affording some pasturage for sheep There are large tracts of rich meadow land along the banks of the rivers, and the vale of Taunton is well adapted for wheat On account of the extensive damage frequently caused in the lower grounds by floods, the Somerset Drainage Act was passed by parliament 11th June 1877, providing for the appointment of commissioners to take measures for the drainage of lands in the valleys of the Parret, Ile, Yeo, Brue, Axe, Cary, and Tone, where extensive damage is frequently caused by floods The following table gives a classification of the holdings in 1875 and 1880 —

	50 Acres and under		From 50 to 100 Acres		From 100 to 300 Acres		From 300 to 500 Acres		From 500 to 1000 Acres		Above 1000 Acres		Total	
	No	Acres	No	Acres	No	Acres	No	Acres	No	Acres	No	Acres	No	Acres
1875	11,999	136,068	1,812	132,687	2,354	396,215	341	127,111	62	37,966	4	6,354	16,572	836,101
1880	13,300	140,912	1,750	129,838	2,319	402,421	358	132,745	72	43,168	4	5,786	17,833	854,870

Out of a total area of 1,049,815 acres there were 867,469 acres in 1885 under culture, of which 625,957 acres, or nearly three fourths, were in permanent pasture, 58,863 under clover and rotation grasses, 115,005 under corn crops, 61,650 green crops, 560 flax, and 5434 fallow Of the corn crops the largest area—49,199 acres —was occupied by wheat, barley occupying 27,934 acres, oats 24,783, beans 11,349, pease 1576, and rye 164 About one half of the area under green crops was occupied by turnips, which covered 30,891 acres, mangold coming next with 10,867 acres, while vetches occupied 8881, potatoes only 7517, and carrots 212 Horses in 1885 numbered 34,848, of which 23,229 were used solely for purposes of agriculture The number of cattle was 236,899, of which 110,068 were cows and heifers in milk or in calf Cattle feeding and dairy-farming are the principal branches of husbandry Large numbers of cattle are brought from Devon to be grazed on the rich Somersetshire meadows The district east and west of Wells, with that of Cheddar, is famed for the cheese of that name, and cheese is also extensively made in other districts Sheep, chiefly Leicesters and Southdowns, are grazed, the number in 1885 being 601,020 The number of pigs in 1885 was 111,719, and of poultry 414,803 In the extent of its orchards, chiefly apple trees, Somerset comes next among the counties of England to Hereford and Devon, the area in 1885 being 23,660 acres The apples are principally made into cider, which is the common drink of the peasantry The area under market gardens was 759 acres, and under nursery grounds 170 acres There were 39,850 acres in 1881 under wood

According to the Landowners Return Somerset in 1873 was divided among 32,765 owners, possessing 940,483 acres, at an annual value of £2,705,393, 18s, or an average value all over of about £2, 17s 6d per acre There were 20,370 proprietors, or about 62 per cent, who possessed less than one acre, and 19,246 acres were common land The following possessed over 9000 acres each —Viscount Portman, 24,171, Sir T D Acland, 16,320, Sir J H G Smyth, 13,543, Earl of Ilchester, 13,169, G F Luttrell, 12,732, Earl of Carnarvon, 12,732, Earl Poulett, 10,118, A G Lethbridge, 9103, and Sir A A Hood, 9008

Administration and Population —Somerset comprises forty hundreds, two liberties (Hampton and Claverton, Mells and Leigh), the cities of Bath (population 51,814 in 1881) and Wells (4634), part (38,131) of the city of Bristol, and the municipal boroughs of Bridgwater (12,007), Chard (2411), Glastonbury (3719), Taunton (16,614), and Yeovil (8479) For parliamentary purposes the county, which was formerly divided into East, Mid, and West Somerset, was by the Act of 1885 parted out in seven separate divisions—North, South, East, West (or Wellington), Bridgwater, Frome, and Wells The borough of Frome was in 1885 merged in its county district The city of Bath returns two members, and a portion of the East Division of Bristol is within the limits of the county In addition to the boroughs the following urban sanitary districts are situated within the county —Burnham (1904), Clevedon (4869), a rising watering place, Frome (9377), Midsomer-Norton (4122), Radstock (3074), Shepton Mallet (5322), Street (2514), Wellington (6360), Weston-super Mare (12,884), a favourite watering-place, and Wiveliscombe (1624) The county has one court of quarter sessions, and is divided into twenty-two petty and special sessional divisions The city of Bath and the borough of Bridgwater have commissions of the peace and separate courts of quarter sessions, and the city of Wells and the borough of Yeovil have commissions of the peace The county contains 489 civil parishes, with parts of three others Ecclesiastically it corresponds closely to the diocese of Bath and Wells From 273,577 in 1801 the population had increased in 1831 to 403,795, in 1851 to 443,916, in 1871 to 463,483, and in 1881 to 469,109, of whom 220,582 were

males and 248,527 females The number of persons to an acre in 1881 was 0 45 and of acres to a person 2 24

History —Somerset, the land of the *Sumorsætan*, is one of the West Saxon shires which grew by gradual conquest from the Welsh, as opposed to the Mercian shires mapped out round a town and called by its name The name may well enough be what it seems at first sight, as it is called in Welsh *Wlad yr-haf*, and in Latin sometimes *æstiva regio* Anyhow the land bears the name of the folk There has never been any central town or acknowledged capital, though Somerton bears a name cognate with the land Assizes, elections, and the like have been held at different places at different times There is no distinct name for the land earlier than the English conquest, it does not preserve the name of any British tribe, like the neighbouring Damnonii and Durotriges But there are abundance of remains both of prehistoric and of Roman times, beginning with the stones which have given their name to *Stan*ton Drew and the great giant's chamber at Wellow Many of the hills are crowned with camps, as Cadbury, seven acres in extent, the remains on Hampton Down, near Bath, the fortress of Maesbury Castle, remarkably well preserved, the camp on Worlebury Hill, containing a number of hut circles, Dolbury camp on the Mendips, of great extent and surrounded by a stone ditch and rampart, and Norton Fitzwarren, near Taunton At Bath the Romans had an important city, *Aquæ Sulis*, on the line of the "fosse" which crossed the centre of Somerset, skirting the eastern ridges of the Mendips by Shepton Mallet and Ilchester (*Ichalis*) to the ancient *Moridunum* From Ilchester another Roman road passed to *Durnovium* (Dorchester) From Brean Down, where there was a Roman port, a road crossed south-eastwards by the Mendips and Shepton Mallet to *Sorbiodunum* (Salisbury) The completeness of the Roman occupation is evidenced not only by the variety and importance of the relics which have been discovered, but by the wide area over which they are spread That lead was wrought by the Romans in the Mendips is evidenced by *laminæ* found at various places bearing the imperial stamp, from the remains of old pottery kilns that have been discovered it would appear that this industry then as now was of considerable importance, the foundations of Roman villas are very common, and there are many remarkably fine specimens of Roman pavements After the withdrawal of the Roman power, the district formed part of the British kingdom of Damnonia or West Wales, and it plays its part in the legends of Arthur, which seem to have grown out of the history of that kingdom The religious history gathers round the Isle of Avalon and its monastery, known in Welsh as Ynysvitrin and in English as Glastonbury, names of somewhat uncertain origin and use, and which must not be pressed too strongly Wild legends connect the place with Joseph of Arimathæa and a crowd of saints from Ireland and elsewhere It is enough to say that it undoubtedly was a religious house, though perhaps of no very great antiquity, before the English conquest reached so far, and that it was the one great church (as Exeter was the one great city) which lived on uninterruptedly through the English conquest That conquest began in 577 with the campaign of Ceawlin, when, after the battle of Deorham, he took Gloucester, Cirencester, and Bath and advanced his frontier to the Axe This was the last heathen conquest, before the second advance under Cenwealh the West-Saxons had become Christians His two victories in 652 and 658 carried the English frontier to the Parret, and took in Glastonbury The later stages are less clear, Centwine in 672 "drove the Bretwealhs to the sea," and Ine fought with the Welsh king Gerest in 710 and made Taunton a border fortress at some time before 722 By this time the conquest was complete In the Danish wars Ælfred in 878 found shelter at Athelney and then went forth to his victory at Ethandun (Edington in Wiltshire), after which peace was made with the Danes at Wedmore We hear of several later Danish invasions, but the Danes never made any settlements Under Edward the Confessor Somerset formed part of the earldom, first of Swegen and then of Harold It probably submitted to the Norman Conqueror after the taking of Exeter in 1068, and an English revolt in the next year was put down In 1088 Ilchester stood a siege in the cause of William Rufus, and the county plays its part in the wars of Stephen During the Middle Ages onward to the period of the civil war the historical events of Somerset—with the exception of the episode of Perkin Warbeck, who seized and abandoned Taunton in 1497—are chiefly associated with BRISTOL (*q v*) The great mass of the people, especially those in the towns, took the Parliament side in the great conflict, but from 1643 to 1645 the shire was in the hands of the Royalists, with the exception of Taunton, which held out heroically under Blake till relieved by Fairfax on the 11th May of the latter year, which was followed by other successes until the whole district was regained by the Cromwellian party The continuance of a strong Puritan feeling in the district was evidenced forty years later by the support given to the Monmouth rebellion, the latest historical event of special importance connected with the county

The history of the county and its existing remains of antiquity have been largely affected by its ecclesiastical history First part of the single bishopric of Wessex at Winchester, then of that of Sherborne, the land of Sumorsætan became a distinct diocese in 909 with its bishopstool at Wells The seat and style of the bishop have changed several times, but the boundaries of the diocese have changed remarkably little Nowhere except in Sussex have the shire and the diocese been so nearly the same thing at all times The great possessions of the bishopric and of the abbey of Glastonbury led to a remarkable lack of castles in the mid part of the county, and also tended to overshadow all other ecclesiastical foundations Even in the other parts of the county castles are not a prominent feature, and no monastic church remains perfect except those of Bath and its cell Dunster To Bath the bishopstool was removed in 1088, and after some shiftings, including a transfer to Glastonbury, the double style of Bath and Wells was established, the monks of Bath and the canons of Wells forming two separate chapters for the bishop At the dissolution of monasteries Bath was suppressed, Wells became the sole chapter, but the name of Bath was still kept in the bishop's style The monastery of Glastonbury was destroyed, as were most of the smaller monasteries also Of those which have left any remains, Woodspring, Montacute (Cluniac), Cleeve (Cistercian), and Michelney are the most remarkable Athelney, founded by Ælfred on the spot where he found shelter, has utterly perished Montacute and Dunster fill a place in both ecclesiastical and military history The castle of Robert of Mortain, the Conqueror's brother, was built on the peaked hill (*mons acutus*) of Leodgaresburh, where the holy cross of Walthem was found The priory arose at the foot Dunster, one of the few inhabited castles in England, stands on a hill crowned by an English mound Besides these there are also remains at Nunney and Castle Carey, but castles are not a strong point in Somerset antiquities In ecclesiastical architecture the two great churches of Wells and Glastonbury supply a great study of the development of the earlier Pointed style out of Romanesque But the architectural strength of the county lies in its great parish churches, chiefly in the Perpendicular style, of which they present a characteristic variety In the same style among greater churches are Bath abbey, Sherborne minster in Dorset, and Saint Mary Redcliff at Bristol (locally in Somerset and till lately in the diocese), a parish church on the type of a minster Of earlier work there is little Norman, and hardly any Primitive Romanesque, but there is a characteristic local style in some of the smaller buildings of the 14th century The earlier churches were often cruciform, and sometimes with side towers In domestic remains no district is richer, Somerset stands alongside of Northamptonshire owing to the abundance of good stone in both Clevedon Court is a very fine inhabited manor-house of the 14th century, and the houses, great and small, of the 15th, 16th, and 17th centuries are endless Indeed, the style has never quite gone out, as the gable and the mullioned window have lingered on to this day Barrington Court in the 16th century and Montacute House in the 17th are specially fine examples There are also some very fine barns, as at Glastonbury, Wells, and Pilton

Among the more illustrious natives of Somersetshire are Dunstan, Roger Bacon, John Locke, Admiral Blake, Pym, Bishop Ken, Fielding, Cudworth, and the poet Daniel

SOMERSET, EDWARD SEYMOUR, DUKE OF (*c* 1500–1552), eldest brother of Jane Seymour, Henry VIII's third wife, was created earl of Hertford in 1537, on the birth of his nephew, afterwards Edward VI In 1544 he commanded in the war with Scotland, and sacked Edinburgh Next year he again commanded against the Scots, and he was employed by Henry in many important negotiations throughout the latter part of his reign On the accession of Edward VI he was made protector by the council, and was soon afterwards created duke of Somerset He at once made use of his power to encourage the extreme Reformers, and a general destruction of ecclesiastical works of art was the result In September 1547, finding the Scots unwilling to listen to his proposals for a marriage between Edward and Mary Stuart, he marched an army into Scotland and won the battle of Pinkie Cleugh,—a worthless victory, which only threw Scotland into the arms of France War with that country followed, and the result was the loss of Boulogne Equally disastrous was the protector's domestic policy He was animated by a dislike of arbitrary government, and by a desire to improve the condition of the poor, but was at the same time a slave to his own ambition He

pushed on the Protestant Reformation with inconsiderate speed, repealed the Treason Acts of Henry VIII's reign, and issued a commission to inquire into agricultural distress The agitation into which these measures threw the country produced insurrections in the west and east, which were with some difficulty suppressed Irritated by his arrogance, rashness, and incapacity, the council, in October 1549, turned against him, deprived him of the protectorate, and confined him in the Tower Released in 1550, he recovered much of his influence through the misgovernment of his successors, and contemplated a return to power at their expense His plans being discovered, he was tried on a charge of felony, and executed on January 22, 1552 His popularity was immense, and in some respects deserved, but he aspired to a tyranny, and had he retained or recovered power he would have gone far towards ruining the nation

SOMERSET, ROBERT CARR, EARL OF (*c* 1590–1645), came of a good Scottish family, the Kers of Ferniehurst The date of his birth seems uncertain, but he was a lad when James I ascended the English throne When this event occurred Carr gave up the position which he had hitherto occupied as page at the Scottish court, and sought for a time to make his fortune in France Returning to England he entered the service of Lord Hay, and soon attracted the attention of the king Entirely devoid of all higher qualities, Carr was endowed with good looks, excellent spirits, and considerable personal accomplishments These advantages were sufficient for James, who knighted the young man and at once took him into favour In 1607 an opportunity enabled the king to confer upon him a more substantial mark of his affection Sir W Raleigh had through his attainder forfeited his life-interest in the manor of Sherborne, but he had previously executed a conveyance by which the property was to pass on his death to his eldest son This document was, unfortunately, rendered worthless by a flaw which gave the king eventual possession of the property Acting on Salisbury's suggestion, James resolved to confer the manor on Carr The case was argued at law, and judgment was in 1609 given for the crown Lady Raleigh received some compensation, apparently inadequate, and Carr at once entered on possession His influence was already such that in 1610 he persuaded the king to dissolve the parliament, which had shown signs of attacking the Scottish favourites Next year Carr was made an English peer, and took his seat in the House of Lords as Viscount Rochester Shortly afterwards he became a privy councillor, and in the autumn of 1613 he was created earl of Somerset In 1614 he became lord chamberlain

He was now at the zenith of his power, but the event had already occurred which was to prove his ruin Before 1609, while still only Sir Robert Carr, he had commenced an intrigue with Lady Essex In 1613 that lady set about procuring a divorce from her husband, with the object of afterwards marrying Carr James favoured the cause of Lady Essex, the court pronounced a decree of divorce, and in December 1613 she married the earl of Somerset Ten days before the court gave judgment, Sir Thomas Overbury, who apparently knew facts concerning Lady Essex which would have been fatal to her success, was poisoned in the Tower No idea seems to have been entertained at the time that Lady Essex and her future husband were implicated For two years more Somerset continued to exercise a paramount influence over James, and it was not till 1615 that his arrogant behaviour began to alienate the king His fall was due, however, not to the loss of the king's favour nor to the combination at court against him, but to the discovery of the circumstances of Overbury's death In July 1615 Somerset obtained a full pardon from the king for all offences which he might have committed Soon afterwards the truth about the murder came out Coke and Bacon were set to unravel the plot After four of the principal agents had been convicted and punished, the earl and countess were brought to trial The latter confessed, and of her guilt there can be no doubt Somerset's share is far more difficult to discover, and probably will never be fully known The evidence against him rested on mere presumption, and he consistently declared himself innocent Probabilities are on the whole in favour of the hypothesis that he was not more than an accessory after the fact James let matters take their course, and both earl and countess were found guilty The sentence was not carried into effect against either culprit. The countess was pardoned immediately The earl appears to have refused to buy forgiveness by concessions, and it was not till 1624 that he obtained his pardon Thenceforward he disappears from public view He died, without heirs, in 1645

SOMERVILLE, previous to its recent incorporation with Boston a city of the United States, in Middlesex county, Massachusetts, lying on Mystic river, 2 miles north-west of the Boston state-house It was named in honour of Richard Somers, a naval officer, and was incorporated as a city in 1872 The population was 24,933 in 1881 Glass-works, bottle-works, flour-mills, a bleachery, and a brass-tubing factory are among the industrial establishments

SOMERVILLE, MARY (1780–1872), scientific writer, was the daughter of Admiral Sir William George Fairfax, and was born 26th December 1780 in the manse of Jedburgh, the house of her mother's sister, wife of Dr Thomas Somerville, author of *My Own Life and Times*, whose son was her second husband She received a rather desultory education, and mastered algebra and Euclid in secret after she had left school, and without any extraneous help In 1804 she married her cousin Captain Samuel Greig, who died in 1806, and in 1812 she married another cousin, Dr William Somerville, inspector of the army medical board, who encouraged and greatly aided her in the study of the physical sciences After her marriage she made the acquaintance on the Continent and in London of the most eminent scientific men of the time, among whom her talents had attracted attention before she had acquired general fame, Laplace paying her the compliment of stating that she was the only woman who understood his works Having been requested by Lord Brougham to translate for the Society for the Diffusion of Useful Knowledge the *Mécanique Céleste* of Laplace, she greatly popularized its form, and its publication in 1831 under the title of *The Mechanism of the Heavens* at once made her famous She was elected an honorary member of the Royal Astronomical Society, and her bust by Chantrey was placed in the hall of the Royal Society of London Her other works are the *Connection of the Physical Sciences* (1834), *Physical Geography* (1848), and *Molecular and Microscopic Science* (1869) Much of the popularity of her writings is due to their clear and crisp style, and the underlying enthusiasm for her subject which pervades them In 1835 she received a pension of £300 from Government She died at Naples 28th November 1872 In the following year there appeared her *Personal Recollections*, consisting of reminiscences written during her old age, and of great interest both for what they

reveal of her own character and life and the glimpses they afford of the literary and scientific society of bygone times

SOMME, a department of northern France, formed in 1790 of a large part of the province of Picardy (comprising Vermandois, Santerre, Amiénois, Ponthieu, Vimeu, and Marquenterre) and a small portion of Artois It is bounded on the N by Pas-de-Calais and Nord, E by Aisne, S by Oise, and S W by Seine-Inferieure, and its sea-coast extends 28 miles along the English Channel Two streams flowing into the Channel—the Authie on the north and the Bresle on the south-west—bound it in these directions The surface consists of great rolling plains, generally well-cultivated and very fertile The highest point, hardly 700 feet above the sea, lies in the south-west, not far from Aumale From the mouth of the Authie to the Bay of the Somme the coast is lined with a belt of sand-dunes about 2 miles broad, behind which is the Marquenterre, a tract of 50,000 acres reclaimed from the sea by means of dykes and traversed by drainage canals The Bay of the Somme, obstructed by dangerous sand-banks, but containing the three ports of Crotoy in the north, St Valery in the south, and Houidel in the south-west, has also been considerably encroached upon by the same methods Next come the shingle banks, behind which the low fields of Cayeux (25,000 acres) have been reclaimed, and then at the hamlet of Ault commence the chalk cliffs, which continue onwards into Normandy The river Somme traverses the department from south-east to north-west for a distance of 125 miles, through a marshy valley abounding in peat Commanded by Ham, Péronne, Amiens, and Abbeville, this valley forms a northern line of defence for Paris Apart from the water-power it supplies, the Somme is of great commercial value, being accompanied by a canal all the way from its source wherever it is not itself navigable From Abbeville to St Valery its lower course forms a maritime canal 165 feet wide, 13 feet deep, and 8 to 9 miles long, capable of bearing at high tide vessels of 300 tons burden From St Valery to the open sea the channel is bounded on the south by a towing-path embankment 2 miles long, and on the north by a dyke, capable of being laid under water, 1 mile long, and there the current hollows out a very variable bed accessible at certain tides for vessels of 500 tons The most important affluents of the Somme—the Ancre from the north-east by way of Albert and Corbie, the Avre from the south-east by Roye, and the Selle from the south by Conty—join the main stream at Amiens The Authie and the Bresle are respectively 65 and 45 miles long The latter ends in a maritime canal about 14 feet deep between Eu and Treport The mean temperature is lower than that of Paris (49° Fahr at Abbeville) Rain falls on 175 days per annum (33 inches at Abbeville)

Of the total area of 1,522,520 acres, 1,178,184 acres are under tillage, 68,844 are under meadows and pasture land, 133,837 are occupied by wood, while 30,514 acres are heaths or uncultivated tracts In 1881 the live stock included 78,069 horses, 940 mules, 6125 asses, 140,512 cattle, 449,675 sheep (wool clip 1117 tons), 82,755 pigs, 21,726 goats, there were also 27,902 hives (116 tons of honey and 36 of wax) The department, especially in the north-east, is one of the best-cultivated in France Beetroot for sugar is the staple crop of the Péronne arrondissement, cereals, fodder, oil plants (especially the poppy), hemp, and potatoes are grown throughout the department, the latter more largely on the seaboard No wine is grown, but the cider harvest of 1883 amounted to 8,904,100 gallons, and beer is a common beverage In 1884 there were grown 7,072,106 bushels of wheat, 1,810,437 of meslin, 1,008,932 of rye, 1,789,089 of barley, 4207 of buckwheat, 11,197,392 of oats, 4,930,067 of potatoes, 1,161,665 tons of beetroot for sugar, and 208,686 tons of beetroot for fodder, 40 tons of hops, 242 tons of hempseed, 651 tons of hemp fibre, 1123 tons of flax, 5245 tons of colza seed, and 240,311 tons of fodder Peat-cutting (84,335 tons in 1882) gives employment to 2640 hands, the best qualities and the deepest workings being in the valley of the Somme, between Amiens and Abbeville The peat of inferior quality is burned on the spot and the ashes used as manure Textile industries employ 36,000 hands The linen and hemp manufacture is carried on in dressing establishments and spinning and weaving factories with 50,000 spindles, 2250 power-looms, and 4000 hand-looms, and the manufactures comprise canvas for packing and sail making, and linen (including damask) Cotton is spun by 72,800 spindles and woven by 745 power-looms and 5000 hand-looms Moleskins and velvets for upholstery and other purposes are among the articles manufactured Wool is wrought in 44 establishments with 124,000 spindles, 120 power-looms, and 400 hand-looms, producing yarns of all kinds, "Scotch cashmeres," "China satins," serges, merinos, repps, poplins, &c Tulles, embroidery, laces, ribbons, plush, carpets, cotton, and woollen hose are also manufactured The last industry employs half the population of Santerre About 6400 workmen are engaged in the iron and copper industries, steam-engine and boiler making, and the production of spinning mill machinery, railway plant, and umbrella frames The arrondissement of Abbeville is the centre of a great lock-manufacture, employing from 4000 to 5000 workmen There are also chemical factories, bleacheries, tanneries, paper-mills (470 hands, product 6108 tons in 1881), saw-mills, and soap and candle works Beetroot sugar is manufactured in 66 establishments (5090 horse power and 6450 workmen) In 1881 53,177 tons of sugar were produced and 2,247,146 gallons of spirit distilled from the molasses and the beet The total number of hands employed in the industries of the department is 64,000, and the total horse power 13,181 Thirty-seven decked boats with 400 hands are engaged in the deep-sea fisheries, in the coast fishery 132 small boats with 300 hands Cereals, horses of the Boulogne or Norman breed, cattle, hemp and linen, and the manufactured goods are the exports of the department Vegetables and other food-stuffs are sent to England, and shingle for the manufacture of earthenware Besides the raw materials for the manufacturing industries, wines, timber, dye-stuffs, and coal (727,783 tons in 1882) are imported There are 385 miles of national and 5033 miles of local roads, 119 miles of navigable river or canal, and 379 miles of railway Administratively the department comprises 5 arrondissements (Amiens, Abbeville, Doullens, Montdidier, and Péronne), 41 cantons, and 836 communes The population in 1881 was 550,837 The department constitutes the diocese of Amiens, which city (population in 1881, 67,874) is also the seat of a court of appeal and the headquarters of the 2d corps d'armée, in which the department is included

SOMMERFELD, an industrial town of Prussia, in the province of Brandenburg, lies on the Lubis, 40 miles to the south-east of Frankfort-on-the-Oder Its manufactures of woollen cloth are important,—the annual value of the goods produced being upwards of half a million sterling, and it also contains finishing and dye works, an iron foundry, boiler-works, &c The population in 1885 was 11,364, almost all Protestants.

SOMNAMBULISM See SLEEP, *supra*, p 157

SOMNÁTH, an ancient but decayed city of peninsular Guzerat, India, with a population in 1881 of 6644, mostly Mohammedans, is situated on a bay of the Arabian Sea, in 20° 53′ N lat and 70° 24′ E long The port, which is called Veráwal, is distinct from the city proper (Deva-Pattan, Somnáth-Pattan, or Prabhas) The latter occupies a prominence on the south side of the bay, is surrounded by massive fortifications, and retains in its ruins and numerous tombs many traces of its former greatness as a commercial port But the city was most famous for the temple just outside its walls in which stood the great idol or rather columnar emblem of Mahadeo called Somnáth (Moon's lord), which was destroyed by Mahmúd of Ghazni, see the details in vol xv p 287 For the so-called "gates of Somnáth," now at Agra, see GHAZNI, vol x p 560 The temple was again plundered by Alá el-Dín in 1300, and appears to have been converted into a mosque See Yule's edition of Marco Polo, vol ii p 389 *sq*

SONDERSHAUSEN See SCHWARZBURG-SONDERSHAUSEN

SONNET (Ital *Sonetto*, dim of *Suono*, Fr *Sonnet*) The sonnet in the literature of modern Europe is a brief poetic form of fourteen rhymed verses, ranged according to prescription It does not, however, belong to what has been called, properly perhaps, under RONDEAU (*q v*), the poetry

of ingenuity. Although in a language like the English it does no doubt require considerable ingenuity to construct a satisfactory sonnet of octave and sestet running upon four rhymes, this ingenuity is only a means to an end, the end being properly that a single wave of emotion, when emotion is either too deeply charged with thought, or too much adulterated with fancy, to pass spontaneously into the movements of pure lyric, shall be embodied in a single metrical flow and return. Whether any given sonnet be composed like that of Pier delle Vigne (of two quatrains with rhymes running a, b, a, b, a, b a, b, and of two tercets with rhymes running c, d, e, c, d, e), or whether the verses be arranged (on the authority of Shakespeare and Drayton) in three quatrains of alternate rhymes clinched by a couplet, or, as in the sonnet of Petrarch, in an octave of two rhymes and a sestet of either two or three rhymes,—in each case the peculiar pleasure which the ear derives from the sonnet as a metrical form lies in the number and arrangement of the verses being *prescribed*, and distinctly recognizable as being prescribed. That the impulse to select for the rendering of single phases of feeling or reflexion a certain recognized form is born of a natural and universal instinct is perhaps evidenced by the fact that even when a metrical arrangement discloses no structural law demanding a prescriptive number and arrangement of verses, the poet will nevertheless, in certain moods, choose to restrict himself to a prescribed number and arrangement, as in the cases of the Italian *stornello*, the Welsh *triban*, and the beautiful rhymeless short ode of Japanese poetry, for the knowledge of which we are indebted to Mr Chamberlain. And perhaps, if space permitted us to probe the matter deeply, we should find that the recognized prescription of form gives a sense of oneness that nothing else save the refrain can give to a poem which, being at once too long for a stanza in a series and too short to have the self-sustaining power of the more extended kinds of poetic art, suffers by suggesting to the ear a sense of the fragmentary and the inchoate. It is not then merely the number of the verses, it is also their arrangement as to rhymes,—an arrangement leading the ear to expect a prescribed sequence and then satisfying that expectation,—which entitles a form of fourteen verses to be called a sonnet.

Hence the so-called irregular sonnets of S. T. Coleridge, which lead the ear of the reader to expect the pleasure of a prescribed arrangement when what they have to offer is a pleasure of an exactly opposite kind—the pleasure of an absolute freedom from prescribed arrangement—are unsatisfactory, while (as the present writer has often pointed out) the same poet's fourteen-line poem, "Work without Hope," in which the reader expects and gets freedom from prescription, is entirely satisfactory. This same little poem of Coleridge's also affords an excellent illustration of another point in connexion with the sonnet. If we trace the history and the development of the sonnet from Pier delle Vigne to Rossetti we shall find that the poet's quest from the very first has been to write a poem in fourteen verses so arranged that they should, better than any other number and arrangement of verses, produce a certain melodic effect upon the ear, and an effect, moreover, that should bear iteration and reiteration in other poems similarly constructed. Now if we ask ourselves whether, beautiful as is this poem, "Work without Hope," taken as a single and original metrical arrangement, we should get out of a series of poems modelled line for line upon it that pleasure of iteration which we get out of a series of Petrarchan sonnets, we shall easily see why the regular sonnet of octave and sestet on the one hand, and what is called the Shakespearean sonnet on the other, have survived all other competing forms.

In modern Europe the sonnet has always had a peculiar fascination for poets of the first class—poets, that is, in whom what we have called poetic energy (see POETRY) and plastic power are equally combined. It would seem that the very fact that the sonnet is a recognized structure suggestive of mere art—suggestive in some measure, indeed, of what Schiller would call "sport" in art—has drawn some of the most passionate poets in the world to the sonnet as the medium of their sincerest utterances. Without being coldly artificial, like the rondeau, the sestina, the *ballade*, the *villanelle*, &c., the sonnet is yet so artistic in structure, its form is so universally known, recognized, and adopted as being artistic, that the too fervid spontaneity and reality of the poet's emotion may be in a certain degree veiled, and the poet can whisper, as from behind a mask, those deepest secrets of the heart which could otherwise only find expression in purely dramatic forms.

That the sonnet was invented, not in Provence, as French critics pretend, but in Italy in the 13th century, is pretty clear, but by whom is still perhaps an open question. Mr S. Waddington (*Sonnets of Living Writers*) and several other contemporary critics attribute to Fra Guittone the honour of having invented the form. But Mr J. A. Symonds has reminded us that the sonnet beginning *Però ch' amore*, attributed to Pier delle Vigne, secretary of state in the Sicilian court of Frederick, has claims which no student of early Italian poetry can ignore.

As regards English sonnets, whether the Petrarchan and the Shakespearean are really the best of all possible forms we need not inquire. But, inasmuch as they have become so vital and so dominant over other sonnet forms that whenever we begin to read the first verse of an English sonnet we expect to find one or other of these recognized rhyme-arrangements, any departure from these two arrangements, even though the result be such a magnificent poem as Shelley's "Ozymandias," disappoints the expectation, baffles the ear, and brings with it that sense of the fragmentary and the inchoate to which we have before alluded. If, however, some writer should arise with sufficient originality of metrical endowment and sufficient poetic power to do what Keats, in a famous experiment of his tried to do and failed,—impress the public ear with a new sonnet structure, impress the public ear so powerfully that a new kind of expectance is created the moment the first verse of a sonnet is recited,—then there will be three kinds of English sonnets instead of two.

With regard to the Petrarchan sonnet, all critics are perhaps now agreed that, while the form of the octave is invariable, the form of the sestet is absolutely free, save that the emotions should govern the arrangement of the verses. But as regards the division between octave and sestet, Mr Mark Pattison says, with great boldness, but perhaps with truth, that by blending octave with sestet Milton missed the very object and end of the Petrarchan scheme. Another critic, however, Mr Hall Caine, in his preface to *Sonnets of Three Centuries*, contends that by making "octave flow into sestet without break of music or thought" Milton consciously or unconsciously invented a new form of sonnet; that is to say, Milton, in his use of the Petrarchan octave and sestet for the embodiment of intellectual substance incapable of that partial disintegration which Petrarch himself always or mostly sought, invented a species of sonnet which is English in impetus, but Italian, or partially Italian, in structure. Hence this critic, like Mr William Sharp (*Sonnets of this Century*), divides all English sonnets into four groups:—(1) sonnets of Shakespearean structure; (2) sonnets of octave and sestet of Miltonic structure; (3) sonnets of contemporary structure, *i.e.*, all sonnets on the Petrarchan model in which the metrical and intellectual "wave of flow and

ebb" (as originally formulated by the present writer in a sonnet on the sonnet, which has appeared in most of the recent anthologies) is strictly observed, and in which, while the rhyme-arrangement of the octave is invariable, that of the sestet is free, (4) sonnets of miscellaneous structure.

With regard to what is called the contemporary form,—a Petrarchan arrangement with the sestet divided very sharply from the octave,—the crowning difficulty and the crowning triumph of the sonnet writer has always been to so handle the rhythm of the prescribed structure as to make it seem in each individual sonnet the inevitable and natural rhythm demanded by the emotion which gives the individual sonnet birth, and this can perhaps only be achieved when the richness and apparent complexity of the rhyme-arrangement is balanced by that perfect lucidity and simplicity of syntax which is the special quest of the "sonnet of flow and ebb"

The wave theory has found acceptance with most recent students of the sonnet, such as Rossetti and the late Mark Pattison, Mr J A Symonds, Mr Hall Caine, and Mr William Sharp Mr Symonds, indeed, seems to hint that the very name given by the Italians to the two tercets, the volta or turn, indicates the metrical meaning of the form "The striking metaphorical symbol," says he, "drawn from the observation of the swelling and declining wave can even in some examples be applied to sonnets on the Shakespearean model, for, as a wave may fall gradually or abruptly, so the sonnet may sink with stately volume or with precipitate subsidence to its close Rossetti furnishes incomparable examples of the former and more desirable conclusion, Sydney Dobell, in *Home in War Time*, yields an extreme specimen of the latter"

And now as to the Shakespearean sonnet Some very acute critics have spoken as if this form were merely a lawless succession of three quatrains clinched by a couplet, and as if the number of the quatrains might just as well have been two or four as the present prescribed number of three If this were so, it would unquestionably be a serious impeachment of the Shakespearean sonnet, for save in the poetry of ingenuity no metric arrangement is otherwise than bad unless it be the result of a deep metrical necessity

If the prescriptive arrangement of *three* quatrains clinched by a couplet is not a metrical necessity, if it is not demanded in order to prevent the couplet from losing its power, such an arrangement is idle and worse than idle, just as, in the case of the Petrarchan sonnet, if it can be shown that the solid unity of the outflowing wave can be maintained as completely upon three rhymes as upon two, then the restriction of the octave to two rhymes is simple pedantry But he who would test the metrical necessity of the arrangement in the Shakespearean sonnet has only to make the experiment of writing a poem of two quatrains with a couplet, and then another poem of four quatrains with a couplet, in order to see how inevitable is the metrical necessity of the Shakespearean number and arrangement for the achievement of the metrical effect which Shakespeare, Drayton, and others sought While in the poem of two quatrains the expected couplet has the sharp epigrammatic effect of the couplet in ordinary stanzas (such as that of *ottava rima*, and as that of the *Venus and Adonis* stanza), destroying that pensive sweetness which is the characteristic of the Shakespearean sonnet, the poem of four quatrains is just sufficiently long for the expected pleasure of the couplet to be dispersed and wasted

The quest of the Shakespearean sonnet is not, like that of the sonnet of octave and sestet, sonority, and, so to speak metrical counterpoint, but sweetness, and the sweetest of all possible arrangements in English versification is a succession of decasyllabic quatrains in alternate rhymes knit together and clinched by a couplet—a couplet coming not so far from the initial verse as to lose its binding power, and yet not so near the initial verse that the ring of epigram disturbs the "linked sweetness long drawn out" of this movement, but sufficiently near to shed its influence over the poem back to the initial verse A chief part of the pleasure of the Shakespearean sonnet is the expectance of the climacteric rest of the couplet at the end (just as a chief part of the pleasure of the sonnet of octave and sestet is the expectance of the answering ebb of the sestet when the close of the octave has been reached), and this expectance is gratified too early if it comes after two quatrains, while, if it comes after a greater number of quatrains than three, it is dispersed and wasted altogether

The French sonnet has a regular Petrarchan octave with a sestet of three rhymes beginning with a couplet The Spanish sonnet is also based on the pure Italian type, and is extremely graceful and airy The same may be said of the Portuguese sonnet—a form of which the illustrious Camoens has left nearly three hundred examples (T W)

SOPHIA DOROTHEA (1666–1726), the daughter and heiress of Duke George William of Brunswick-Luneburg-Celle, was born on September 15, 1666 On November 21, 1682, she was married to Prince George Louis of Hanover, afterwards George I of England, to whom she bore in 1683 a son, afterwards King George II, and in 1687 a daughter, Sophia Dorothea, afterwards the wife of Frederick William I of Prussia and the mother of Frederick the Great For her illicit relations with Count Philip Christopher von Konigsmark (see vol x p 420) Sophia Dorothea was divorced from her husband the elector in December 1694, and the remainder of her life was spent in a dignified captivity under a military guard at her ancestral seat of Ahlden She died on November 13, 1726 Her correspondence with Konigsmark was discovered at Lund by Prof Palmblad, and published by him in 1847, see also the Count von Schulenburg's *Herzogin von Ahlden* (Leipsic, 1852)

SOPHISTS Sophist, or "man of wisdom," was the name given by the Greeks about the middle of the 5th century B C to certain teachers of a superior grade who, distinguishing themselves from philosophers on the one hand and from artists and craftsmen on the other, claimed to prepare their pupils, not for any particular study or profession, but for civic life For nearly a hundred years the sophists held almost a monopoly of general or liberal education Yet, within the limits of the profession, there was considerable diversity both of theory and of practice. Four principal varieties are distinguishable, and may be described as the sophistries of culture, of rhetoric, of politics, and of eristic or disputation Each of these predominated in its turn, though not to the exclusion of others, the sophistry of culture beginning about 447, and leading to the sophistry of eristic, and the sophistry of rhetoric taking root in central Greece about 427, and merging in the sophistry of politics Further, since Socrates and the Socratics were educators, they too might be, and in general were, regarded as sophists, but, as they conceived truth—so far as truth was attainable—rather than success in life, in the law court, in the assembly, or in debate, to be the right end of intellectual effort, they were at variance with their rivals, and are commonly ranked by historians, not with the sophists, who confessedly despaired of knowledge, but with the philosophers, who, however unavailingly, continued to seek it With the establishment of the great philosophical schools—first, of

the Academy, next of the Lyceum—the philosophers took the place of the sophists as the educators of Greece.

The sophistical movement was then primarily an attempt to provide a general or liberal education which should supplement the customary instruction in reading, writing, gymnastic, and music. But, as the sophists of the first period chose for their instruments grammar, style, literature, and oratory, while those of the second and third developments were professed rhetoricians, sophistry exercised an important influence upon literature. Then again, as the movement, taking its rise in the philosophical agnosticism which grew out of the early physical systems, was itself persistently sceptical, sophistry may be regarded as an interlude in the history of philosophy. Finally, the practice of rhetoric and eristic, which presently became prominent in sophistical teaching, had, or at any rate seemed to have, a mischievous effect upon conduct; and the charge of seeking, whether in exposition or in debate, not truth but victory—which charge was impressively urged against the sophists by Plato—grew into an accusation of holding and teaching immoral and unsocial doctrines, and in our own day has been the subject of eager controversy. In the present article the matters above indicated will be dealt with under the following heads:—(1) the genesis and development of sophistry; (2) the relations of sophistry to education, literature, and philosophy; (3) the theory of Grote.

(1) *Genesis and Development of Sophistry*.—Sophistry arose out of a crisis in philosophy. The earlier Ionian physicists,—Thales, Anaximander, and Anaximenes,—in their attempts to trace the multiplicity of things to a single material element, had been troubled by no misgivings about the possibility of knowledge. But, when Heraclitus to the assumption of fire as the single material cause added the doctrine that all things are in perpetual flux, he found himself obliged to admit that things cannot be known. Thus, though, in so far as he asserted his fundamental doctrine without doubt or qualification, he was a dogmatist, in all else he was a sceptic. Again, the Eleatic Parmenides, deriving from the theologian Xenophanes the distinction between ἐπιστήμη and δόξα, conceived that, whilst the One exists, and is the object of knowledge, the Multiplicity of things becomes, and is the object of opinion; but, when his successor Zeno provided the system with a logic, the consistent application of that logic resolved the fundamental doctrine into the single proposition "One is One," or, more exactly, into the single identity "One One." Thus Eleaticism, though professedly dogmatic, was inconsistent in its theory of the One and its attributes, and openly sceptical in regard to the world of nature. Lastly, the philosophers of the second physical succession,—Empedocles and Anaxagoras,—not directly attacking the great mystery of the One and the Many, but in virtue of a scientific instinct approaching it through the investigation of phenomena, were brought by their study of sensation to perceive and to proclaim the inadequacy of the organs of sense. Thus they too, despite their air of dogmatism, were in effect sceptics. In short, from different standpoints, the three philosophical successions had devised systems which were in reality sceptical, though they had none of them recognized the sceptical inference.

Towards the middle of the 5th century, however, Protagoras of Abdera, taking account of the teaching of the first, and possibly of the second, of the physical successions, and Gorgias of Leontini, starting from the teaching of the metaphysical succession of Elea, drew that sceptical inference from which the philosophers had shrunk. If, argued Protagoras in a treatise entitled *Truth*, all things are in flux, so that sensation is subjective, it follows that "Man is the measure of all things, of what is, that it is, and of what is not, that it is not"; in other words, there is no such thing as objective truth. Similarly, Gorgias, in a work *On Nature, or on the Nonent*, maintained (*a*) that nothing is, (*b*) that, if anything is, it cannot be known, (*c*) that, if anything is and can be known, it cannot be expressed in speech; and the summaries which have been preserved by Sextus Empiricus (*Adv. Math.*, vii. 65-87) and by the author of the *De Melisso*, &c. (cc. 5, 6), show that, in defending these propositions, Gorgias availed himself of the arguments which Zeno had used to discredit the popular belief in the existence of the Many; in other words, that Gorgias turned the destructive logic of Zeno against the constructive ontology of Parmenides, thereby not only reducing Eleaticism to nothingness, but also, until such time as a better logic than that of Zeno should be provided, precluding all philosophical inquiry whatsoever. Thus, whereas the representatives of the three successions had continued to regard themselves as philosophers or seekers after truth, Protagoras and Gorgias, plainly acknowledging their defeat, withdrew from the ungrateful struggle.

Meagre as were the results which the earlier thinkers had obtained, the extinction of philosophy just at the time when the liberal arts became more technical, and consequently less available as employments of leisure, threatened to leave a blank in Hellenic life. Accordingly Protagoras, while with the one hand he put away philosophy, with the other offered a substitute. Emphasizing the function of the teacher, which with the philosophers had been subordinate, and proclaiming the right end of intellectual endeavour to be, not "truth" (ἀλήθεια) or "wisdom" (σοφία), which was unattainable, but "virtue" or "excellence" (ἀρετή), he sought to communicate, not a theory of the universe, but an aptitude for civic life. "The lesson which I have to teach," Plato makes him say (*Prot.*, 318 E), "is prudence or good counsel, both in respect of domestic matters, that the man may manage his household aright, and in respect of public affairs, that he may be thoroughly qualified to take part, both by deed and by word, in the business of the state. In other words, I profess to make men good citizens." As instruments of education Protagoras used grammar, style, poetry, and oratory. Thus, whereas hitherto the young Greek, having completed his elementary training in the schools of the γραμματιστής, the κιθαριστής, and the παιδοτρίβης, was left to prepare himself for his life's work as best he might, by philosophical speculation, by artistic practice, or otherwise, one who passed from the elementary schools to the lecture-room of Protagoras received from him a "higher education." The programme was exclusively literary, but for the moment it enabled Protagoras to satisfy the demand which he had discovered and evoked. Wherever he went, his lecture-room was crowded with admiring pupils, whose homage filled his purse and enhanced his reputation.

After Protagoras the most prominent of the literary sophists was Prodicus of Ceos. Establishing himself at Athens, he taught "virtue" or "excellence," in the sense attached to the word by Protagoras, partly by means of literary subjects, partly in discourses upon practical ethics. It is plain that Prodicus was an affected pedant. Yet his simple conventional morality found favour, and Plato (*Rep.*, 600 C) couples him with Protagoras in his testimony to the popularity of the sophists and their teaching.

At Athens, the centre of the intellectual life of Greece, there was soon to be found a host of sophists: some of them strangers, others citizens; some of them bred under Protagoras and Prodicus, others self-taught. In the teaching of the sophists of this younger generation

two points are observable. First, their independence of philosophy and the arts being assured, though they continued to regard "civic excellence" as their aim, it was no longer necessary for them to make the assertion of its claims a principal element in their exposition. Secondly, for the sake of novelty they extended their range, including scientific and technical subjects, but handling them, and teaching their pupils to handle them, in a popular way. In this stage of sophistry then, the sophist, though not a specialist, trenched upon the provinces of specialists; and accordingly Plato (*Prot.*, 318 E) makes Protagoras pointedly refer to sophists who, "when young men have made their escape from the arts, plunge them once more into technical study, and teach them such subjects as arithmetic, astronomy, geometry, and music." The sophist of whom the Platonic Protagoras is here thinking was Hippias of Elis, who gave popular lectures, not only upon the four subjects just mentioned, but also upon grammar, mythology, family history, archæology, Homerology, and the education of youth. In this polymath we see at once the degradation of the sophistry of culture and the link which connects Protagoras and Prodicus with the eristics, who at a later period taught, not, like Hippias, all branches of learning, but a universally applicable method of disputation.

Meanwhile, Gorgias of Leontini, who, as has been seen, had studied and rejected the philosophy of western Greece, gave to sophistry a new direction by bringing to the mother country the technical study of rhetoric,—especially forensic rhetoric (Plato, *Gorg.*, 454 B, *cf.* Aristotle, *Rhet.*, 1354 b 26),—which study had begun in Sicily with Corax and Tisias nearly forty years before. Gorgias was already advanced in years and rich in honours when, in 427, he visited Athens as the head of an embassy sent to solicit aid against Syracuse. Received with acclamation, he spent the rest of his long life in central Greece, winning applause by the display of his oratorical gifts and acquiring wealth by the teaching of rhetoric. There is no evidence to show that at any period of his life he called himself a sophist; and, as Plato (*Gorg.*, 449 A) makes him describe himself as a ῥήτωρ, it is reasonable to suppose that he preferred that title. That he should do so was only natural, since his position as a teacher of rhetoric was already secure when Protagoras made his first appearance in the character of a sophist; and, as Protagoras, Prodicus, and the rest of the sophists of culture offered a comprehensive education, of which oratory formed only a part, whilst Gorgias made no pretence of teaching "civic excellence" (Plato, *Meno*, 95 C), and found a substitute for philosophy, not in literature generally, but in the professional study of rhetoric alone, it would have been convenient if the distinction between sophistry and rhetoric had been maintained. But, though, as will be seen hereafter, these two sorts of education were sometimes distinguished, Gorgias and those who succeeded him as teachers of rhetoric, such as Thrasymachus of Chalcedon and Polus of Agrigentum, were commonly called by the title which Protagoras had assumed and brought into familiar use.

Rhetorical sophistry, as taught by Gorgias with special reference to the requirements of the law courts, led by an easy transition to political sophistry. During the century which had elapsed since the expulsion of the Pisistratids and the establishment of the democracy, the Athenian constitution had developed with a rapidity which produced an oligarchical reaction, and the discussion of constitutional principles and precedents, always familiar to the citizen of Athens, was thus abnormally stimulated. The Peloponnesian War too not only added a deeper interest to ordinary questions of policy, but also caused the relations of dissentient parties, of allied and belligerent states, of citizens and aliens, of bond and free, of Greeks and barbarians, to be eagerly debated in the light of present experience. It was only natural then that some of those who professed to prepare young Athenians for public life should give to their teaching a distinctively political direction; and accordingly we find Isocrates recognizing teachers of politics, and discriminating them at once from those earlier sophists who gave popular instruction in the arts and from the contemporary eristics. To this class, that of the political sophists, may be assigned Lycophron, Alcidamas, and Isocrates himself. For, though that celebrated personage would have liked to be called, not "sophist," but "political philosopher," and tried to fasten the name of "sophist" upon his opponents the Socratics, it is clear from his own statement that he was commonly ranked with the sophists, and that he had no claim, except on the score of superior popularity and success, to be dissociated from the other teachers of political rhetoric. It is true that he was not a political sophist of the vulgar type, that as a theorist he was honest and patriotic, and that, in addition to his fame as a teacher, he had a distinct reputation as a man of letters; but he was a professor of political rhetoric, and, as such, in the phraseology of the day, a sophist. He had already reached the height of his fame when Plato opened a rival school at the Academy, and pointedly attacked him in the *Gorgias*, the *Phædrus*, and the *Republic*. Thenceforward there was a perpetual controversy between the rhetorician and the philosopher, and the struggle of educational systems continued until, in the next generation, the philosophers were left in possession of the field.

While the sophistry of rhetoric led to the sophistry of politics, the sophistry of culture led to the sophistry of disputation. It has been seen that the range of subjects recognized by Protagoras and Prodicus gradually extended itself, until Hippias professed himself a teacher of all branches of learning, including in his list subjects taught by artists and professional men but handling them from a popular or non-professional point of view. The successors of the polymath claimed to possess and to communicate, not the knowledge of all branches of learning, but an aptitude for dealing with all subjects, which aptitude should make the knowledge of any subject superfluous. In other words, they cultivated skill in disputation. Now skill in disputation is plainly a valuable accomplishment; and, as the Aristotelian logic grew out of the regulated discussions of the eristics and their pupils, the disputant sophistry of the 4th century deserves more attention and more respect than it usually receives from historians of Greek thought. But when men set themselves to cultivate skill in disputation, irrespective of the matter debated,—when men regard the matter discussed, not as a serious issue, but as a thesis upon which to practise their powers of controversy,—they learn to pursue, not truth, but victory; and, their criterion of excellence having been thus perverted, they presently prefer ingenious fallacy to solid reasoning, and the applause of bystanders to the consciousness of honest effort. Indeed, the sophists generally had a predisposition to error of this sort, not only because sophistry was from the beginning a substitute for the pursuit of truth, but also because the successful professor, travelling from city to city, or settling abroad, could take no part in public affairs, and thus was not at every step reminded of the importance of the "material" element of exposition and reasoning. Paradox, however, soon becomes stale, and fallacy wearisome. Hence, despite its original popularity, eristical sophistry could not hold its ground. The man of the world who had cultivated it in his youth regarded it in riper years as a

foolish pedantry, or at best as a propædeutic exercise, while the serious student, necessarily preferring that form of disputation which recognized truth as the end of this as of other intellectual processes, betook himself to one or other of the philosophies of the revival

In order to complete this sketch of the development of sophistry in the latter half of the 5th century and the earlier half of the 4th, it is necessary next to take account of Socrates and the Socratics A foe to philosophy and a renegade from art, Socrates took his departure from the same point as Protagoras, and moved in the same direction, that of the education of youth Finding in the cultivation of "virtue" or "excellence" a substitute for the pursuit of scientific truth, and in disputation the sole means by which "virtue" or "excellence" could be attained, he resembled at once the sophists of culture and the sophists of eristic But, inasmuch as the "virtue" or "excellence" which he sought was that of the man rather than that of the official, while the disputation which he practised had for its aim, not victory, but the elimination of error, the differences which separated him from the sophists of culture and the sophists of eristic were only less considerable than the resemblances which he bore to both, and further, though his whole time and attention were bestowed upon the education of young Athenians, his theory of the relations of teacher and pupil differed from that of the recognized professors of education, inasmuch as the taking of fees seemed to him to entail a base surrender of the teacher's independence The principal characteristics of Socrates's theory of education were accepted, *mutatis mutandis*, by the leading Socratics With these resemblances to the contemporary professors of education, and with these differences, were Socrates and the Socratics sophists or not? To this question there is no simple answer, yes or no It is certain that Socrates's contemporaries regarded him as a sophist, and it was only reasonable that they should so regard him, because in opposition to the physicists of the past and the artists of the present he asserted the claims of higher education But, though according to the phraseology of the time he was a sophist, he was not a typical sophist,—his principle that, while scientific truth is unattainable by man, right opinion is the only basis of right action, clearly differentiating him from all the other professors of "virtue" Again, as the Socratics—Plato himself, when he established himself at the Academy, being no exception—were, like their master, educators rather than philosophers, and in their teaching laid especial stress upon discussion, they too were doubtless regarded as sophists, not by Isocrates only, but by their contemporaries in general, and it may be conjectured that the disputatious tendencies of the Megarian school made it all the more difficult for Plato and others to secure a proper appreciation of the difference between dialectic, or discussion with a view to the discovery of truth, and eristic, or discussion with a view to victory Changing circumstances, however, carry with them changes in the meaning and application of words Whereas, so long as philosophy was in abeyance Socrates and the Socratics were regarded as sophists of an abnormal sort, as soon as philosophy revived it was dimly perceived that, in so far as Socrates and the Socratics dissented from sophistry, they preserved the philosophical tradition This being so, it was found convenient to revise the terminology of the past, and to include in the philosophical succession those who, though not philosophers, had cherished the sacred spark As for Socrates, he ranked himself neither with the philosophers, who professed to know, nor with the sophists, who professed to teach, and, if he sometimes described himself as a φιλόσοφος, he was careful to indicate that he pretended to no other knowledge than that of his own limitations

It would seem then, (1) that popular nomenclature included under the term "sophist" all teachers—whether professors, or, like Socrates, amateurs—who communicated, not artistic skill, nor philosophical theory, but a general or liberal education, (2) that, of those who were commonly accounted sophists, some professed culture, some forensic rhetoric, some political rhetoric, some eristic, some (*i e*, the Socratics) dialectic, (3) that the differences between the different groups of sophists were not inconsiderable, and that in particular the teaching of the rhetoricians was distinct in origin, and, in so far as its aim was success in a special walk of life, distinct in character, from the more general teaching of the sophists of culture, the eristics, and the dialecticians, while the teaching of the dialecticians was discriminated from that of the rest, in so far as the aim of the dialecticians was truth, or at least the bettering of opinion, and, consequently, (4) that, in awarding praise and blame to sophistry and its representatives, the distinctive characteristics of the groups above enumerated must be studiously kept in view

Lapse of time and change of circumstances brought with them, not merely changes in the subjects taught, but also changes in the popular estimate of sophistry and sophists The first and most obvious sentiment which sophistry evoked was an enthusiastic and admiring interest The sophist seemed to his youthful hearers to open a new field of intellectual activity and thereby to add a fresh zest to existence But in proportion to the fascination which he exercised upon the young was the distrust which he inspired in their less pliable elders Not only were they dismayed by the novelty of the sophistical teaching, but also they vaguely perceived that it was subversive of authority, of the authority of the parent over the child as well as of the authority of the state over the citizen Of the two conflicting sentiments, the favour of the young, gaining as years passed away, naturally prevailed, sophistry ceased to be novel, and attendance in the lecture-rooms of the sophists came to be thought not less necessary for the youth than attendance in the elementary schools for the boy The lively enthusiasm and the furious opposition which greeted Protagoras had now burnt themselves out, and before long the sophist was treated by the man of the world as a harmless, necessary pedagogue

That sophistry must be studied in its historical development was clearly seen by Plato, whose dialogue called the *Sophist* contains a formal review of the changing phases and aspects of sophistical teaching The subject which is discussed in that dialogue and its successor the *Statesman* being the question "Are sophist, statesman, and philosopher identical or different?" the Eleate who acts as protagonist seeks a definition of the term "sophist" by means of a series of divisions or dichotomies In this way he is led to regard the sophist successively—(1) as a practitioner of that branch of mercenary persuasion in private which professes to impart "virtue" and exacts payment in the shape of a fee, in opposition to the flatterer who offers pleasure, asking for sustenance in return, (2) as a practitioner of that branch of mental trading which purveys from city to city discourses and lessons about "virtue," in opposition to the artist who similarly purveys discourses and lessons about the arts, (3) and (4) as a practitioner of those branches of mental trading, retail and wholesale, which purvey discourses and lessons about "virtue" within a city, in opposition to the artists who similarly purvey discourses and lessons about the arts, (5) as a practitioner of that branch of eristic which brings to the professor pecuniary emolument, eristic being the systematic form of antilogic, and dealing with justice, injustice, and other abstractions, and antilogic being that form of disputation which uses question and answer in private, in opposition to forensic, which uses continuous discourse in the law-courts, (6) as a practitioner of that branch of education which purges away the vain conceit of wisdom by means of cross examination, in opposition to the traditional method of reproof or admonition These definitions being thus various, the Eleate notes that the sophist, in consideration of a fee, disputes, and teaches others to dispute, about things divine, cosmical, metaphysical, legal, political, technical,—in fact, about everything,

—not having knowledge of them, because universal knowledge is unattainable; after which he is in a position to define the sophist (7) as a conscious impostor who, in private, by discontinuous discourse, compels his interlocutor to contradict himself, in opposition to the δημολογικός, who, in public, by continuous discourse, imposes upon crowds.

It is clear that the final definition is preferred, not because of any intrinsic superiority, but because it has a direct bearing upon the question "Are sophist, statesman, and philosopher identical or different?" and that the various definitions represent different stages or forms of sophistry as conceived from different points of view. Thus the first and second definitions represent the founders of the sophistry of culture, Protagoras and Prodicus, from the respective points of view of the older Athenians, who disliked the new culture, and the younger Athenians, who admired it; the third and fourth definitions represent imitators to whom the note of itinerancy was not applicable; the fifth definition represents the earlier eristics, contemporaries of Socrates, whom it was necessary to distinguish from the teachers of forensic oratory; the sixth is framed to meet the anomalous case of Socrates, in whom many saw the typical sophist, though Plato conceives this view to be unfortunate; and the seventh and final definition, having in view eristical sophistry fully developed, distinguishes it from δημολογική, i.e., political rhetoric, but at the same time hints that, though σοφιστική and δημολογική may be discriminated, they are nevertheless near akin, the one being the ape of philosophy, the other the ape of statesmanship. In short, Plato traces the changes which, in less than a century, had taken place in the meaning of the term, partly through changes in the practice of the sophists, partly through changes in their surroundings and in public opinion, so as to show by a familiar instance that general terms which do not describe natural kinds cannot have a stable connotation.

Now it is easy to see that in this careful statement Plato recognizes three periods. The first four definitions represent the period of Protagoras, Prodicus, and their immediate successors, when the object sought was "virtue," "excellence," "culture," and the means to it was literature. The fifth and sixth definitions represent the close of the 5th century, when sophistry handled eristically, and perhaps, though Plato demurs to the inclusion, dialectically, questions of justice, injustice, and the like, δικανική or forensic rhetoric being its proximate rival. The seventh definition represents the first half of the 4th century, when sophistry was eristical in a wider field, having for its rival, not forensic rhetoric, but the rhetoric of the assembly. Plato's classification of educational theories is then substantially the classification adopted in this article, though, whereas here, in accordance with well-attested popular usage, all the educational theories mentioned are included under the head of sophistry, Plato allows to rhetoric, forensic and political, an independent position, and hints that there are grounds for denying the title of sophist to the dialectician Socrates. Incidentally we gather two important facts,—(1) that contemporary with the dialectic of Socrates there was an eristic, and (2) that this eristic was mainly applied to ethical questions. Finally, we may be sure that, if Plato was thus careful to distinguish the phases and aspects of sophistical development, he could never have fallen into the modern error of bestowing upon those whom the Greeks called sophists either indiscriminate censure or indiscriminate laudation.

(2) *Relations of Sophistry to Education, Literature, and Philosophy.*—If then the sophists, from Protagoras to Isocrates, were before everything educators, it becomes necessary to inquire whether their labours marked or promoted an advance in educational theory and method. At the beginning of the 5th century B.C. every young Greek of the better sort already received rudimentary instruction, not only in music and gymnastics, but also in reading and writing. Further, in the colonies, and especially the colonies of the West, philosophy and art had done something for higher education. Thus in Italy the Pythagorean school was, in the fullest sense of the term, an educational institution; and in Sicily the rhetorical teaching of Corax and Tisias was presumably educational in the same sense as the teaching of Gorgias. But in central Greece, where, at any rate down to the Persian Wars, politics, domestic and foreign, were all-engrossing, and left the citizen little leisure for self-cultivation, the need of a higher education had hardly made itself felt. The overthrow of the Persian invaders changed all this. Henceforward the best of Greek art, philosophy, and literature gravitated to Athens, and with their concentration and consequent development came a general and growing demand for teaching. As has been seen, it was just at this period that philosophy and art ceased to be available for educational purposes, and accordingly the literary sophists were popular precisely because they offered advanced teaching which was neither philosophical nor artistic. Their recognition of the demand and their attempt to satisfy it are no small claims to distinction. That, whereas before the time of Protagoras there was little systematic education in the colonies and less in central Greece, after his time attendance in the lecture-rooms of the sophists was the customary sequel to attendance in the elementary schools, is a fact which speaks for itself.

But this is not all. The education provided by the sophists of culture had positive merits. When Protagoras included in his course grammar, style, interpretation of the poets, and oratory, supplementing his own continuous expositions by disputations in which he and his pupils took part, he showed a not inadequate appreciation of the requisites of a literary education; and it may be conjectured that his comprehensive programme, which Prodicus and others extended, had something to do with the development of that versatility which was the most notable element in the Athenian character.

There is less to be said for the teachers of rhetoric, politics, and eristic, who, in limiting themselves each to a single subject,—the rhetoricians proper or forensic rhetoricians to one branch of oratory, the politicians or political rhetoricians to another, and the eristics to disputation,—ceased to be educators and became instructors. Nevertheless rhetoric and disputation, though at the present day strangely neglected in English schools and universities, are, within their limits, valuable instruments; and, as specialization in teaching does not necessarily imply specialization in learning, many of those who attended the lectures and the classes of a rhetorician or an eristic sought and found other instruction elsewhere. It would seem then that even in its decline sophistry had its educational use. But in any case it may be claimed for its professors that in the course of a century they discovered and turned to account most of the instruments of literary education.

With these considerable merits, normal sophistry had one defect, its indifference to truth. Despairing of philosophy,—that is to say, of physical science,—the sophists were prepared to go all lengths in scepticism. Accordingly the epideictic sophists in exposition, and the argumentative sophists in debate, one and all, studied, not matter but style, not accuracy but effect, not proof but persuasion. In short, in their hostility to science they refused to handle literature in a scientific spirit. That this defect was serious was dimly apprehended even by those who frequented and admired the lectures of the earlier sophists; that it was fatal was clearly seen by Socrates, who, himself commonly regarded as a sophist, emphatically reprehended, not only the taking of fees, which was after all a mere incident, objectionable because it seemed to preclude independence of thought, but also the fundamental disregard of truth which infected every part and every phase of sophistical teaching. To these contemporary censures the modern critic cannot refuse his assent.

To literature and to oratory the sophists rendered good service. Themselves of necessity stylists, because their professional success largely depended upon skilful and effective exposition, the sophists both of culture and of rhetoric were professedly teachers of the rules of grammar and the principles of written and spoken discourse. Thus, by example as well as by precept, they not only taught their hearers to value literary and oratorical excellence,

but also took the lead in fashioning the style of their time Their influence in these respects was weighty and important Whereas when sophistry began prose composition was hardly practised in central Greece, the sophists were still the leaders in literature and oratory when Plato wrote the *Republic*, and they had hardly lost their position when Demosthenes delivered the *Philippics* In fact, it is not too much to say that it was the sophists who provided those great masters with their consummate instrument, and it detracts but little from the merit of the makers if they were themselves unable to draw from it its finer tones

The relation of sophistry to philosophy was throughout one of pronounced hostility From the days of Protagoras, when this hostility was triumphant and contemptuous, to the days of Isocrates, when it was jealous and bitter, the sophists were declared and consistent sceptics But, although Protagoras and Gorgias had examined the teaching of their predecessors so far as to satisfy themselves of its futility and to draw the sceptical inference, their study of the great problem of the day was preliminary to their sophistry rather than a part of it, and, as the overthrow of philosophy was complete and the attractions of sophistry were all-powerful, the question, "What is knowledge?" ceased for a time to claim or to receive attention There is then no such thing as a "sophistical theory of knowledge" Similarly, the recognition of a "sophistical ethic" is, to say the least, misleading It may have been that the sophists' preference of seeming to reality, of success to truth, had a mischievous effect upon the morality of the time, but it is clear that they had no common theory of ethics, and there is no warrant for the assumption that a sophist, as such, specially interested himself in ethical questions When Protagoras asserted "civic excellence" or "virtue" to be the end of education, he neither expressed nor implied a theory of morality Prodicus in his platitudes reflected the customary morality of the time Gorgias said plainly that he did not teach "virtue" If Hippias, Polus, and Thrasymachus defied conventional morality, they did so independently of one another, and in this, as in other matters, they were disputants maintaining paradoxical theses, rather than thinkers announcing heretical convictions The morality of Isocrates bore a certain resemblance to that of Socrates In short, the attitude of the sophists towards inquiry in general precluded them, collectively and individually, from attachment to any particular theory Yet among the so-called sophists there were two who had philosophical leanings, as appears in their willingness to be called by the title of philosopher First, Socrates, whilst he conceived that the physicists had mistaken the field of inquiry, absolute truth being unattainable, maintained, as has been seen, that one opinion was better than another, and that consistency of opinion, resulting in consistency of action, was the end which the human intellect properly proposes to itself Hence, though an agnostic, he was not unwilling to be called a philosopher, in so far as he pursued such truth as was attainable by man Secondly, when sophistry had begun to fall into contempt, the political rhetorician Isocrates claimed for himself the time-honoured designation of philosopher, "herein," says Plato, "resembling some tinker, bald-pated and short of stature, who, having made money, knocks off his chains, goes to the bath, buys a new suit, and then takes advantage of the poverty and desolation of his master's daughter to urge upon her his odious addresses" (*Rep*, vi 495 E) It will be seen, however, that neither Socrates nor Isocrates was philosopher in any strict sense of the word, the speculative aims of physicists and metaphysicians being foreign to the practical theories both of the one and of the other

As for the classification of sophistical methods, so for their criticism, the testimony of Plato is all-important It may be conjectured that, when he emerged from the purely Socratic phase of his earlier years, Plato gave himself to the study of contemporary methods of education and to the elaboration of an educational system of his own, and that it was in this way that he came to the metaphysical speculations of his maturity It may be imagined further that, when he established himself at the Academy, his first care was to draw up a scheme of education, including arithmetic, geometry (plane and solid), astronomy, harmonics, and dialectic, and that it was not until he had arranged for the carrying out of this programme that he devoted himself to the special functions of professor of philosophy However this may be, we find amongst his writings,—intermediate, as it would seem, between the Socratic conversations of his first period of literary activity and the metaphysical disquisitions of a later time,—a series of dialogues which, however varied their ostensible subjects, agree in having a direct bearing upon education Thus the *Protagoras* brings the educational theory of Protagoras and the sophists of culture face to face with the educational theory of Socrates, so as to expose the limitations of both, the *Gorgias* deals with the moral aspect of the teachings of the forensic rhetorician Gorgias and the political rhetorician Isocrates, and the intellectual aspect of their respective theories of education is handled in the *Phædrus*, the *Meno* on the one hand exhibits the strength and the weakness of the teaching of Socrates, and on the other brings into view the makeshift method of those who, despising systematic teaching, regarded the practical politician as the true educator, the *Euthydemus* has for its subject the eristical method, finally, having in these dialogues characterized the current theories of education, Plato proceeds in the *Republic* to develop an original scheme Plato's criticisms of the sophists are then, in the opinion of the present writer, no mere *obiter dicta*, introduced for purposes of literary adornment or dramatic effect, but rather the expressions of profound and reasoned conviction, and, as such, entitled at any rate to respect For the details of Plato's critique, the reader should go, not to the summaries of commentators, but to the dialogues themselves In this place it is sufficient to say that, while Plato accounts no education satisfactory which has not knowledge for its basis, he emphatically prefers the scepticism of Socrates, which, despairing of knowledge, seeks right opinion, to the scepticism of the sophists, which, despairing of knowledge, abandons the attempt to better existing beliefs

(3) *The Theory of Grote*—The post-Platonic historians and critics, who, while they knew the earlier sophistry only through tradition, were eye-witnesses of the sophistry of the decadence, were more alive to the faults than to the virtues of the movement Overlooking the differences which separated the humanists from the eristics, and both of these from the rhetoricians, and taking no account of Socrates, whom they regarded as a philosopher, they forgot the services which Protagoras and Prodicus, Gorgias and Isocrates, had rendered to education and to literature, and included the whole profession in an indiscriminate and contemptuous censure This prejudice, establishing itself in familiar speech, has descended from antiquity to modern times, colouring, when it does not distort, the narratives of biographers and the criticisms of commentators "The sophists," says Grote, "are spoken of as a new class of men, or sometimes in language which implies a new doctrinal sect or school, as if they then sprang up in Greece for the first time—ostentatious impostors, flattering and duping the rich youth for their own personal gain, undermining the morality of Athens, public and private, and encouraging their pupils to the unscrupulous prosecution of ambition and cupidity They are even affirmed to have succeeded in corrupting the general morality, so that Athens had become miserably degenerated and vicious in the latter years of the Peloponnesian War, as compared with what she was in the time of Miltiades and Aristeides," and, although amongst the pre-Grotian scholars there were some who saw as clearly as Grote himself that "the sophists are a much calumniated race" (G H Lewes), it is certain that historians of philosophy, and editors of Plato, especially the "acumen plumbeum Stallbaumii," had given ample occasion for the energetic protest contained in the famous sixty-seventh chapter of Grote's *History of Greece* Amongst the many merits of that admirable

scholar, it is one of the greatest that he has laid "the fiend called *die Sophistik*," that is to say, the theory that sophistry was an organized conspiracy against law and morals Nevertheless, in this matter he is always an advocate, and it may be thought that, while he successfully disposes of the current slander, his description of his clients needs correction in some important particulars Hence the following paragraphs, while they will resume and affirm his principal results, will qualify and impugn some of his positions

In so far as he is critical, Grote leaves little to be desired That the persons styled sophists "were not a sect or school, with common doctrines or method," is clear Common doctrine, that is to say, common doctrine of a positive sort, they could not have, because, being sceptics, they had nothing which could be called positive doctrine, while there was a period when even their scepticism was in no wise distinctive, because they shared it with all or nearly all their contemporaries Neither were they united by a common educational method, the end and the instruments of education being diversely conceived by Protagoras, Gorgias, and Isocrates, to say nothing of the wider differences which separate these three from the eristics, and all the four normal types from the abnormal type represented by Socrates

Again, it is certain that the theoretical and practical morality of the sophists, regarded as a class, was "neither above nor below the standard of the age" The taking of fees, the pride of professional success, and the teaching of rhetoric are no proofs either of conscious charlatanism or of ingrained depravity Indeed, we have evidence of sound, if conventional, principle in Prodicus's apologue of the "Choice of Heracles," and of honourable, though eccentric, practice in the story of Protagoras's treatment of defaulting pupils But, above all, it is antecedently certain that defection from the ordinary standard of morality would have precluded the success which the sophists unquestionably sought and won In fact, public opinion made the morality of the sophists, rather than the sophists the morality of public opinion Hence, even if we demur to the judgment of Grote that "Athens at the close of the Peloponnesian War was not more corrupt than Athens in the days of Miltiades and Aristeides," we shall not "consider the sophists as the corruptors of Athenian morality," but rather with Plato lay the blame upon society itself, which, "in popular meetings, law-courts, theatres, armies, and other great gatherings, with uproarious censure and clamorous applause" (*Rep*, vi 492), educates young and old, and fashions them according to its pleasure

Nor can we regard "Plato and his followers as the authorized teachers of the Greek nation and the sophists as the dissenters" On the contrary, the sophists were in quiet possession of the field when Plato, returning to Athens, opened the rival school of the Academy, and, while their teaching in all respects accommodated itself to current opinion, his, in many matters, ran directly counter to it

But if thus far Grote's protest against prevalent assumptions carries an immediate and unhesitating conviction, it may be doubted whether his positive statement can be accounted final "The appearance of the sophists," he says, "was no new fact . The paid teachers—whom modern writers set down as the sophists, and denounce as the modern pestilence of their age—were not distinguished in any marked or generic way from their predecessors" Now it is true that before 447 B C, besides the teachers of writing, gymnastic, and music, to whom the young Greek resorted for elementary instruction, there were artists and artisans who not only practised their crafts but also communicated them to apprentices and pupils, and that accordingly the Platonic Protagoras recognizes in the gymnast Iccus, the physician Herodicus, and the musicians Agathocles and Pythoclides forerunners of the sophists But the forerunners of the sophists are not to be confounded with the sophists themselves, and the difference between them is not far to seek Though some of those who resorted to the teachers of rudiments and the artists derived from them such substitute for "higher education" as was before 447 generally obtainable, it was only incidentally that the teachers of rudiments and the artists communicated anything which could be called by that name Contrariwise, the sophists were always and essentially professors of the higher education, and, although in process of time specialization assimilated sophistry to the arts, at the outset at any rate, its declared aim—the cultivation of the civic character—sufficiently distinguished sophistical education both from rudimentary instruction and from artistic training It is true too that in some of the colonies philosophy had busied itself with higher education, but here again the forerunners of the sophists are easily distinguished from the sophists, since the sophists condemned, not only the scientific speculations of their predecessors, but also their philosophical aims, and offered to the Greek world a new employment for leisure, a new intellectual ambition

Nor is it altogether correct to say that "the persons styled sophists had no principles common to them all and distinguishing them from others" Various as were the phases through which sophistry passed between the middle of the 5th century and the middle of the 4th, the sophists—Socrates himself being no exception—had in their declared antagonism to philosophy a common characteristic, and, if in the interval, philosophical speculation being temporarily suspended, scepticism ceased for the time to be peculiar, at the outset, when Protagoras and Gorgias broke with the physicists, and in the sequel, when Plato raised the cry of "back to Parmenides," this common characteristic was distinctive

Further, it may be doubted whether Grote is sufficiently careful to distinguish between the charges brought against the sophists personally and the criticism of their educational methods When the sophists are represented as conscious impostors who "poisoned and demoralized by corrupt teaching the Athenian moral character," he has, as has been seen, an easy and complete reply But the question still remains—Was the education provided by Protagoras, by Gorgias, by Isocrates, by the eristics, and by Socrates good, bad, or indifferent? And, though the modern critic will not be prepared with Plato to deny the name of education to all teaching which is not based upon an ontology, it may nevertheless be thought that normal sophistry—as opposed to the sophistry of Socrates—was in various degrees unsatisfactory, in so far as it tacitly or confessedly ignored the "material" element of exposition or reasoning

And if Grote overlooks important agreements he seems also to understate important differences Regarding Protagoras, Gorgias, and Isocrates as types of one and the same sophistry (pp 487, 493, 495, 499, 544, 2d edition), and neglecting as slander or exaggeration all the evidence in regard to the sophistry of eristic (p 540), he conceives that the sophists undertook "to educate young men so as to make them better qualified for statesmen or ministers," and that "that which stood most prominent in the teaching of Gorgias and the other sophists was, that they cultivated and improved the powers of public speaking in their pupils" Excellent as a statement of the aim and method of Isocrates, and tolerable as a statement of those of Gorgias, these phrases are inexact if applied to

Protagoras, who, making "civic virtue" his aim, regarded statesmanship and administration as parts of "civic virtue," and consequently assigned to oratory no more than a subordinate place in his programme, while to the eristics—whose existence is attested, not only by Plato, but also by Isocrates and Aristotle—and to Socrates—whom Grote himself accounts a sophist—the description is plainly and palpably inappropriate.

Grote's note about the eristical sophists is perhaps the least satisfactory part of his exposition. That "there were in Athens persons who abused the dialectical exercise for frivolous puzzles" he admits; but "to treat Euthydemus and Dionysodorus as samples of 'The Sophists' is," he continues, "altogether unwarrantable." It would seem then that, while he regards rhetoric as the function of normal sophistry, taking indifferently as his types Protagoras, Gorgias, and Isocrates, he accounts Euthydemus and Dionysodorus (together with Socrates) as sophists, but as sophists of an abnormal sort, who may therefore be neglected. Now this view is inconsistent with the evidence of Plato, who, in the *Sophist*, in his final and operative definition, gives prominence to the eristical element, and plainly accounts it the main characteristic, not indeed of the sophistry of the 5th century, but of the sophistry of the 4th. It must be presumed then that, in virtue of his general suspicions of the Platonic testimony, Grote in this matter leaves the *Sophist* out of account. There is, however, another theory of the significance of Plato's allusions to eristical sophistry, that of Prof. H. Sidgwick, whose brilliant defence of Grote is an indispensable supplement to the original document. Giving a hearty general assent to Grote's theory, Sidgwick nevertheless introduces qualifications similar to some of those which are suggested in this article. In particular he allows that "there was at any rate enough of charlatanism in Protagoras and Hippias to prevent any ardour for their historical reputation," that the sophists generally "had in their lifetime more success than they deserved," that it was "antagonism to their teaching which developed the genius of Socrates," and, above all, that, "in his anxiety to do justice to the Sophist, Grote laid more stress than is at all necessary on the partisanship of Plato." Now this last admission precludes Sidgwick from neglecting, as Grote had done, the evidence of the *Euthydemus*. Pointing out that the sophists of that dialogue "profess εἰς ἀρετῆς ἐπιμέλειαν προτρέψαι by means of dialogue," that "they challenge the interlocutor ὑπέχειν λόγον," that "their examples are drawn from common objects and vulgar trades," that "they maintain positions that we know to have been held by Megarians and Cynics," he infers that "what we have here presented to us as 'sophistic' is neither more nor less than a caricature of the Megarian logic;" and further, on the ground that "the whole conception of Socrates and his effect on his contemporaries, as all authorities combine to represent it, requires us to assume that his manner of discourse was quite novel, that no one before had systematically attempted to show men their ignorance of what they believed themselves to know," he is "disposed to think that the art of disputation which is ascribed to sophists in the *Euthydemus* and the *Sophistes* (and exhaustively analysed by Aristotle in the περὶ Σοφιστικῶν Ἐλέγχων) originated entirely with Socrates, and that he is altogether responsible for the form at least of this second species of sophistic." To this theory the present writer is unable to subscribe. That Plato was not careful to distinguish the Megarians and the Cynics from the eristical sophists, and that the disputants of the 4th century affected some of the mannerisms of the greatest disputant of the 5th century, he willingly concedes. But he cannot allow either that the Megarians and the Cynics were the only eristics, or that eristical sophistry began with Socrates. Plainly this is not the place for a full examination of the question; yet it may be remarked—(1) that the previous history of the sophists of the *Euthydemus*, who had been professors of tactics (Xenophon, *Mem.*, iii. 1, 1), swordsmanship, and forensic argumentation, implies that they came to eristic, not from the sophistry of Socrates, but from that of the later humanists, polymaths of the type of Hippias; (2) that the fifth and sixth definitions of the *Sophist*, in which "that branch of eristic which brings pecuniary gain to the practitioner" is opposed to the "patience-trying, purgative elenchus" of Socrates, indicate that contemporary with Socrates there were eristics whose aims were not his; (3) that, whereas the sophist of the final definition "disputes, and teaches others to dispute, about things divine, cosmical, metaphysical, legal, political, technical, in fact, about all things," we have no ground for supposing that the Megarians and the Cynics used their eristic for any purpose except the defence of their logical heresies.

Nor is it possible to accept the statements that "the splendid genius, the lasting influence, and the reiterated polemics of Plato have stamped the name sophist upon the men against whom he wrote as if it were their recognized, legitimate, and peculiar designation," and that "Plato not only stole the name out of general circulation, in order to fasten it specially upon his opponents the paid teachers, but also connected with it express discreditable attributes which formed no part of its primitive and recognized meaning and were altogether distinct from, though grafted upon, the vague sentiment of dislike associated with it." That is to say, Grote supposes that for at least eight and forty years, from 447 to 399, the paid professors had no professional title; that, this period having elapsed, a youthful opponent succeeded in fastening an uncomplimentary title, not only upon the contemporary teachers, but also, retrospectively, upon their predecessors; and that, artfully enhancing the indignity of the title affixed, he thus obscured, perverted, and effaced the records and the memories of the past. Manifestly all three propositions are antecedently improbable. But more than this: whereas in the nomenclature of Plato's contemporaries Protagoras, Gorgias, Socrates, Dionysodorus, and Isocrates were all of them sophists, Plato himself in his careful investigation summarized above limits the meaning of the term so that it shall include the humanists and the eristics only. Now, if his use of the term was stricter than the customary use, he can hardly be held answerable for the latter.

Nor is Grote altogether just in his account of Plato's attitude towards the several sophists, or altogether judicious in his appreciation of Plato's testimony. However contemptuous in his portraiture of Hippias and Dionysodorus, however severe in his polemic against Isocrates, Plato regards Protagoras with admiration and Gorgias with respect. While he emphasizes in the later sophists the consequences of the fundamental error of sophistry,—its indifference to truth,—he does honour to the genius and the originality of the leaders of the movement. Indeed, the author of this article finds in the writings of Plato a grave and discriminating study of the several forms of sophistry, but no trace whatsoever of that blind hostility which should warrant us in neglecting his clear and precise evidence.

In a word, the present writer agrees with Grote that the sophists were not a sect or school with common doctrine or method; that their theoretical and practical morality was neither above nor below that of their age, being, in fact, determined by it; and that Plato and his followers are not to be regarded as the authorized teachers of the Greek nation, nor the sophists as the dissenters, but *vice versa*. At the same time, in opposition to Grote, he maintains that the appearance of the sophists marked a new departure, in so far as they were the first professors of "higher education" as such; that they agreed in the rejection of "philosophy"; that the education which they severally gave was open to criticism, inasmuch as, with the exception of Socrates, they attached too much importance to the form, too little to the matter, of their discourses and arguments; that humanism, rhetoric, politic, and disputation were characteristic, not of all sophists collectively, but of sections of the profession; that Plato was not the first to give a special meaning to the term "sophist" and to affix it upon the professors of education; and, finally, that Plato's evidence is in all essentials trustworthy.

Bibliography.—On the significance of the sophistical movement, see E. Zeller, *Philosophie d. Griechen*, 4th ed., Leipsic, 1876, i. 932–1011 (*Presocratic Philosophy*, London, 1881, ii. 394–516); G. Grote, *History of Greece*, London, 1851, &c., ch. lxvii.; E. M. Cope, "On the Sophists," and "On the Sophistical Rhetoric," in *Journ. Class. and Sacr. Philol.*, Cambridge, ii. 1855, and iii. 1857, an erudite but inconclusive reply to Grote; H. Sidgwick, "The Sophists," in *Journ. of Philol.*, Cambridge, iv. 1872, and v. 1874, a brilliant defence of Grote; A. W. Benn, *The Greek Philosophers*, London, 1882, i. 53–107. Compare ETHICS, vol. viii. pp. 576–577.

For lists of treatises upon the life and teaching of particular sophists, see Ueberweg, *Grundriss d. Gesch. d. Philos.* i. §§ 27–32 (*History of Philosophy*, London, 1880). On the later use of the term "sophist," see RHETORIC. (H. JA.)

SOPHOCLES, the most perfect, and next to Æschylus the greatest, of Greek tragic poets, was born 495 B.C. and died 406 B.C. As in the case of other Athenian celebrities, various particulars of his life are handed down, few of which, however, deserve much attention, even the reports attributed to contemporaries being mostly trivial if not puerile. He is known to have reached old age, and his career as a dramatist is believed to have extended over more than sixty years (468–406). His father's name was Sophillus, of the deme Colonus Hippius, the aristocratic quarter, where the Government of the Four Hundred was afterwards constituted. The family burial-place is said by the anonymous biographer to have been ten stadia from the city, on the Decelean Way. These facts run counter to the tradition, which seems to have been already discredited by Alexandrian critics, that Sophillus was an artisan. The date assigned for the poet's birth is in accordance with the tale that young Sophocles, then a pupil of the musician Lamprus, was chosen to lead the chorus of boys (ἠθέων λεκτοί, *Œd. Tyr.*, 18) in the celebration of the victory of Salamis (480 B.C.). The time of his death is fixed by the allusions to it in the *Frogs* of Aristophanes and in the *Muses*, a lost play of Phrynichus, the comic poet, which were both produced in 405 B.C., shortly before the capture of the city. And the legend which implies that Lysander allowed him funeral honours is one of those which, like the story of Alexander and Pindar's house at Thebes, we can at least wish to be founded on fact, though we should probably substitute Agis for Lysander. Apart from tragic victories, the event of Sophocles's life most fully authenticated is his appointment at the age of fifty-five as one of the generals who served with Pericles in the Samian War (440–439 B.C.). Conjecture has been rife as to the possibility of his here improving acquaintance with Herodotus, whom he probably met some years earlier at Athens (see HERODOTUS). But the distich quoted by Plutarch—

> Ὠιδὴν Ἡροδότῳ τεῦξεν Σοφοκλῆς ἐτέων ὢν
> Πέντ' ἐπὶ πεντήκοντα—

is a slight ground on which to reject the stronger tradition according to which Herodotus was ere this established at Thurii, and the coincidences in their writings may be accounted for by their having drawn from a common source. The fact of Sophocles's generalship is the less surprising if taken in connexion with the interesting remark of his biographer (whose *Life*, though absent from the earliest MS. through some mischance, bears marks of an Alexandrian origin) that he took his full share of civic duties, and even served on foreign embassies:—Καλῶς τ' ἐπαιδεύθη καὶ ἐτράφη ἐν εὐπορίᾳ, καὶ ἐν πολιτείᾳ καὶ ἐν πρεσβείαις ἐξητάζετο. The large acquaintanceship which this implies, not only in Athens, but in Ionic cities generally, is a point of main importance in considering the opportunities of information at his command. And, if we credit this assertion, we are the more at liberty to doubt the other statement, though it is not incredible, that his appointment as general was due to the political wisdom of the *Antigone*.

The testimony borne by Aristophanes to the amiability of the poet's temper (ὁ δ' εὔκολος μὲν ἐνθάδ', εὔκολος δ' ἐκεῖ) agrees with the record of his biographer that he was universally beloved. And the anecdote recalled by Cephalus in Plato's *Republic*, that Sophocles welcomed the release from the passions which is brought by age, accords with the spirit of his famous Ode to Love in the *Antigone*. The Sophocles who, according to Aristotle (*Rhet.*, iii. 18), said of the Government of the Four Hundred that it was the better of two bad alternatives (probably the same who was one of the *probuli*) may or may not have been the poet. Other gossiping stories are hardly worth repeating,—as that Pericles rebuked his love of pleasure and thought him a bad general, though a good poet, that he humorously boasted of his own "generalship" in affairs of love, or that he said of Æschylus that he was often right without knowing it, and that Euripides represented men as they are, not as they ought to be. Such trifles rather reflect contemporary or subsequent impressions of a superficial kind than tell us anything about the man or the dramatist. The gibe of Aristophanes (*Pax*, 695 *sq.*), that Sophocles in his old age was become a very Simonides in his love for gain, may turn on some perversion of fact,[1] without being altogether fair to either poet. It is certainly irreconcilable with the remark (*Vit. Anon.*) that in spite of pressing invitations he refused to leave Athens for kings' courts. And the story of his indictment by his son Iophon for incompetence to manage his affairs,—to which Cicero has given some weight by quoting it in the *De Senectute*,—appears to be really traceable to Satyrus (*flor. c.* 200 B.C.), the same author who gave publicity to the most ridiculous of the various absurd accounts of the poet's death,—that his breath failed him for want of a pause in reading some passage of the *Antigone*. Satyrus is at least the sole authority for the defence of the aged poet, who, after reciting passages from the *Œd. Col.*, is supposed to have said to his accusers, "If I am Sophocles I am no dotard, and if I dote I am not Sophocles." On the other hand, we need not the testimony of biographers to assure us that he was devoted to Athens and renowned for piety. He is said to have been priest of the hero Alcon (or Halon) in his old age, and himself to have received divine honours after death.

That the duty of managing the actors as well as of training the chorus belonged to the author is well known. But did Æschylus act in his own plays? This certainly is implied in the tradition that Sophocles, because of the weakness of his voice, was the first poet who desisted from doing so. In his *Thamyras*, however, he is said to have performed on the lyre to admiration, and in his *Nausicaa* (perhaps as coryphæus) to have played gracefully the game of ball. Various minor improvements in decoration and stage carpentry are attributed to him,—whether truly or not who can tell? It is more interesting, if true, that he wrote his plays having certain actors in his eye, that he formed an association (θίασον) for the promotion of liberal culture, and that he was the first to introduce three actors on the stage.[2] It is asserted on the authority of Aristoxenus that Sophocles was also the first to employ Phrygian melodies. And it is easy to believe that *Aj.*, 693 *sq.*, *Trach.*, 205 *sq.*, were sung to Phrygian music, though there are strains in Æschylus (*e.g.*, *Choeph.*, 152 *sq.*, 423 *sq.*), which it is hard to distinguish essentially from these. Ancient critics had also noted his familiarity with Homer, especially with the *Odyssey*, his power of selection and of extracting an exquisite grace from all he touched (whence he was named the "Attic Bee"), his mingled felicity and boldness, and, above all, his subtle delineation of human nature and feeling. They observed that the balanced proportions and fine articulation of his work are such that in a single half line or phrase he often conveys the impression of an entire character.

[1] If any of Sophocles's elegies or odes were "pot-boilers," this might be due rather to his easy temper (εὐκολία) in yielding to a prevalent habit of the time than to any meanness (βαναυσία or γλισχρότης).

[2] If this was so, it must have been previous to the appearance of the Orestean trilogy.

Nor is this verdict of antiquity likely to be reversed by modern criticism. The object of the present article, however, is not to praise Sophocles, but rather to describe him. And it is time to turn from Alexandrian or Byzantine fancies and judgments to the poet's extant works.

His minor poems, elegies, pæans, &c., have all perished, and of his hundred and odd dramas only seven remain. These all belong to the period of his maturity (he had no decline), and not only the titles (as Lessing said) but some scanty fragments of more than ninety others have been preserved. Several of these were, of course, satyric dramas. And this recalls a point of some importance, which has been urged on the authority of Suidas, who says that "Sophocles began the practice of pitting play against play, instead of the tetralogy." If it were meant that Sophocles did not exhibit tetralogies, this statement would have simply to be rejected. For the word of Suidas (950 A.D.) has no weight against quotations from the lists of tragic victories (διδασκαλίαι) which there is no other reason for discrediting. The remark might be due to the impression made on some critics by the greater complexity and completeness of a play of Sophocles—say the *Œdipus Tyrannus* or *Antigone*—as compared, say, with the *Persæ* or the *Septem contra Thebas*. It is distinctly asserted, for example, on the authority of the διδασκαλίαι, that the *Bacchæ* of Euripides, certainly as late as any play of Sophocles, was one of a trilogy or tetralogy. And if the custom was thus maintained for so long it was clearly impossible for any single competitor to break through it. But it seems probable that the trilogy had ceased to be the continuous development of one legend or cycle of legends,—"presenting Thebes or Pelops' line,"—if, indeed, it ever was so exclusively; and if, as Scholl and others have suggested, a Sophoclean tetralogy was still linked together by some subtle bond of tragic thought or feeling, this would not affect the criticism of each play considered as an artistic whole. At the same time it appears that the satyric drama lost its grosser features and became more or less assimilated to the milder form of tragedy. And these changes, or something like them, may have given rise to the statement in Suidas.[1]

If the diction of Sophocles sometimes reminds his readers of the *Odyssey*, the subjects of his plays were more frequently chosen from those later epics which subsequently came to be embodied in the epic cycle,—such as the *Æthiopis*, the *Little Iliad*, the *Iliupersis*, the *Cypria*, the *Nosti*, the *Telegonia* (all revolving round the tale of Troy), the *Thebaica*, the Οἰχαλίας ἅλωσις, and others, including probably, though there is no mention of such a thing, some early version of the Argonautic story. In one or other of these heroic poems the legends of all the great cities of Hellas were by this time embodied; and, though there must also have been a cloud of oral tradition floating over many a sacred spot, the dramatic poet does not seem, unless in the *Œdipus Coloneus*, to have directly drawn from this. He was content to quarry from the epic rhapsodies the materials for his more concentrated art, much as Shakespeare made use of Hollingshed or Plutarch, or as the subjects of Tennyson's *Idylls of the King* have been taken from Sir Thomas Malory. As Sophocles has been accused of narrowing the range of tragic sympathy from Hellas to Athens, it deserves mention here that, of some hundred subjects of plays attributed to him, fifteen only are connected with Attica, while exactly the same number belong to the tale of Argos, twelve are Argonautic, and thirty Trojan. Even Corinthian heroes (Bellerophon, Polyidus) are not left out. It seems probable on the whole that, within the limits allowed by convention, Sophocles was guided simply by his instinctive perception of the tragic capabilities of a particular fable. This was evidently Lessing's view, and may be confirmed by quoting his striking remarks upon the subject of one of the lost tragedies, the *Thyestes at Sicyon*:—

"Nach der abscheulichen Mahlzeit, die ihm sein Bruder bereitete, flog er nach Sicyon. Und hier war es wo er, auf Befragung des Orakels, wie er sich an seinem Bruder rachen sollte, die Antwort bekam, er sollte seine eigne Tochter entehren. Er uberfiel dies auch unbekannter Weise; und aus diesem Beischlafe ward Ægisth, der den Atreus hernach umbrachte, erzeugt. Die Verzweiflung einer geschandeten Prinzessin! Von einem Unbekannten! In welchem sie endlich ihren Vater erkennt! Eine von ihrem Vater entehrte Tochter! Und aus Rache entehrt! Geschandet, einen Morder zu gebaren! Welche Situationen! welche Scenen!"

To say that subsidiary or collateral motives were never present to Sophocles in the selection of a subject would, however, be beyond the mark. His first drama, the *Triptolemus*, must have been full of local colouring; the *Ajax* appealed powerfully to the national pride; and in the *Œdipus Coloneus* some faint echoes even of oligarchical partisanship may be possibly discerned. But, even where they existed, such motives were collateral and subsidiary; they were never primary. All else was subordinated to the dramatic, or, in other words, the purely human, interest of the fable. This central interest is even more dominant and pervading in Sophocles than the otherwise supreme influence of religious and ethical ideas. The idea of destiny, for example, was of course inseparable from Greek tragedy. Its prevalence was one of the conditions which presided over the art from its birth, and, unlike Æschylus, who wrestles with gods, our poet simply accepts it, both as a *datum* of tradition and a fact of life. But in the free handling of Sophocles even fate and providence are adminicular to tragic art. They are instruments through which sympathetic emotion is awakened, deepened, intensified. And, while the vision of the eternal and unwritten laws was holier yet, for it was not the creation of any former age, but rose and culminated with the Sophoclean drama, still to the poet and his Periclean audience this was no abstract notion, but was inseparable from their impassioned contemplation of the life of man—so great and yet so helpless, aiming so high and falling down so far, a plaything of the gods and yet essentially divine. This lofty vision subdued with the serenity of awe the terror and pity of the scene, but from neither could it take a single tremor or a single tear. Emotion was the element in which Greek tragedy lived and moved, albeit an emotion that was curbed to a serene stillness through its very depth and intensity.

The final estimate of Sophoclean tragedy must largely depend upon the mode in which his treatment of destiny is conceived. That Æschylus had risen on the wings of faith to a height of prophetic vision, from whence he *saw* the triumph of equity and the defeat of wrong as an eternal process moving on toward one divine event,—that he realized sin, retribution, responsibility, as no other ancient did,—may be gladly conceded. But it has been argued[2] that because Sophocles is saddened by glancing down again at actual life,—because in the fatalism of the old fables he finds the reflexion of a truth,—he in so far takes a step backward as a tragic artist. Now is this altogether just? His value for what is highest in man is none the less because he strips it of earthly rewards, nor is his reverence for eternal law less deep because he knows that its workings are sometimes pitiless. Nor, once more,

[1] The advantages and defects of the trilogy as a dramatic form are admirably stated by G. Gunther, *Grundzuge der Tragischen Kunst*, Berlin, 1885. The small number of victories attributed to Sophocles, in proportion to the number of his plays, is only intelligible on the supposition that these were presented in groups.

[2] Gunther, *op. cit.*

does he disbelieve in providence, because experience has shown him that the end towards which the supreme powers lead forth mankind is still unseen. We miss something of the exultant energy of the Marathonian man, but under the grave and gentle guidance of his successor we lose nothing of the conviction that, "because right is right, to follow right were wisdom in the scorn of consequence." Not only the utter devotion of Antigone, but the lacerated innocence of Œdipus and Deianira, the tempted truth of Neoptolemus, the essential nobility of Ajax, leave an impress on the heart which is ineffaceable, and must elevate and purify while it remains. In one respect, however, it must be admitted that Sophocles is not before his age. There is an element of unrelieved vindictiveness, not merely inherent in the fables, but inseparable from the poet's handling of some themes, which is only too consistent with the temper of the "tyrant city." Æschylus represents this with equal dramatic vividness, but he associates it, not with heroism, but with crime.

Sophocles is often praised for skilful construction. But the secret of his skill depends in large measure on the profound way in which the central situation in each of his fables has been conceived and felt. Concentration is the distinguishing note of tragedy, and it is by greater concentration that Sophocles is distinguished from other tragic poets. In the *Septem contra Thebas* or the *Prometheus* there is still somewhat of epic enlargement and breadth; in the *Hecuba* and other dramas of Euripides separate scenes have an idyllic beauty and tenderness which affect us more than the progress of the action as a whole, a defect which the poet sometimes tries to compensate by some novel denouement or catastrophe. But in following a Sophoclean tragedy we are carried steadily and swiftly onward, looking neither to the right nor to the left; the more elaborately any scene or single speech is wrought the more does it contribute to enhance the main emotion, and if there is a deliberate pause it is felt either as a welcome breathing space or as the calm of brooding expectancy.

The result of this method is the union, in the highest degree, of simplicity with complexity, of largeness of design with absolute finish, of grandeur with harmony. Superfluities are thrown off without an effort through the burning of the fire within. Crude elements are fused and made transparent. What look like ornaments are found to be inseparable from the organic whole. Each of the plays is admirable in structure, not because it is cleverly put together, but because it is so completely alive.

The spectator of a Sophoclean tragedy was invited to witness the supreme crisis of an individual destiny, and was possessed at the outset with the circumstances of the decisive moment. Except in the *Trachiniæ*, where the retrospective soliloquy of Deianira is intended to emphasize her lonely position, this exposition is effected through a brief dialogue, in which the protagonist may or may not take part. In the *Œdipus Tyrannus* the king's entrance and his colloquy with the aged priest introduce the audience at once to the action and to the chief person. In the *Ajax* and *Philoctetes* the entrance or discovery of the hero is made more impressive by being delayed. Immediately after the prologos the chorus enter, numbering fifteen, either chanting in procession as in the *Antigone* and *Œd. Tyr.*, or dispersedly as in the *Œd. Col.* and *Philoctetes*, or, thirdly, as in the *Electra*, where, after entering silently during the monody of the heroine, and taking up their position in the orchestra, they address her one by one. With a remarkable exception, to be noted presently, the chorus having once entered remain to the end. They always stand in some carefully adjusted relation to the principal figure. The elders of Thebes, whose age and coldness throw into relief the fervour and the desolation of Antigone, are the very men to realize the calamity of Œdipus, and, while horror-stricken, to lament his fall. The rude Salaminian mariners are loyal to Ajax, but cannot enter into his grief. The Trachinian maidens would gladly support Deianira, who has won their hearts, but they are too young and inexperienced for the task. The noble Argive women can sympathize with the sorrows of Electra, but no sympathy can soothe her distress.

The parodos of the chorus is followed by the first scene or epeisodion, with which the action may be said to begin. For in the course of this the spectator's interest is strongly roused by some new circumstance involving an unforeseen complication,—the awakening of Ajax (*Aj.*), the burial of Polynices (*Ant.*), the dream of Clytæmnestra (*El.*), the dark utterance of Tiresias (*Œd. Tyr.*), the arrival of Lichas with Iole (*Trach.*), the report of Ismene announcing Creon's coming (*Œd. Col.*), the sudden entreaty of Philoctetes crossed by the entrance of the pretended mariner (*Phil.*). The action from this point onwards is like a steadily flowing stream into which a swift and turbulent tributary has suddenly fallen, and the interest advances with rapid and continuous climax until the culmination is reached and the catastrophe is certain. The manner in which this is done, through the interweaving of the ῥήσεις and στιχομυθία of the dialogue with the στάσιμα of the chorus, and the κομμοί and κομματικά (where there is interchange between the chorus and the persons), is very different in different dramas, one of the principal charms of Sophocles being his power of ingenious variation in the employment of his resources. Not less admirable is the strength with which he sustains the interest after the *peripeteia*,[1] whether, as in the *Antigone*, by heaping sorrow upon sorrow, or, as in the first *Œdipus*, by passing from horror to tenderness and unlocking the fountain of tears. The extreme point of boldness in arrangement is reached in the *Ajax*, where the chorus and Tecmessa, having been warned of the impending danger, depart severally in quest of the vanished hero, and thus leave not only the stage but the orchestra vacant for the soliloquy that precedes his suicide.

No such general description as has been here attempted can give even a remote impression of the march of Sophoclean tragedy,—by what subtle yet firm and strongly marked gradations the plot is unfolded; how stroke after stroke contributes to the harmonious totality of feeling; what vivid interplay, on the stage, in the orchestra, and between both, builds up the majestic, ever-moving spectacle. Examine, for example, the opening scene or πρόλογος of the *Œdipus Tyrannus*. Its function is merely to propound the situation; yet it is in itself a miniature drama. First there is the silent spectacle of the eager throng of suppliants at the palace gate,—young children, youths, and aged priests. To them the king appears, with royal condescension and true public zeal. The priest expresses their heartfelt loyalty, describes the distress of Thebes, and, extolling Œdipus's past services, implores him to exercise his consummate wisdom for the relief of his people. The king's reply unveils yet further his incessant watchfulness and anxious care for his subjects. And he discloses a new object to their expectancy and hope. Creon, a royal person, had been sent to Delphi, and should ere then have returned with the response of Apollo. At this all hearts are trembling in suspense, when a figure is seen approaching. He is wreathed with Apollo's laurel; he looks cheerfully. What has Phœbus said? Another moment of suspense is interposed. Then the oracle is repeated,—so thrilling to

[1] A tragic action has five stages, whence the five acts of the modern drama:—the start, the rise, the height, the change, the close.

the spectator who understands the story, so full of doubt and hope and dread to all the persons of the drama "It is for the blood of Laius—his murderers are harboured in the land of Thebes The country must be purged" That is the culminating point of the little tragedy While Œdipus asks for information, while in gaiety of heart he undertakes the search, while he bids the folk of Cadmus to be summoned thither, the spectators have just time to take in the full significance of what has passed, which every word that is uttered sends further home All this in 150 lines!

Or, once more, consider the employment of narrative by this great poet The *Tyrannus* might be again adduced, but let us turn instead to the *Antigone* and the *Trachiniæ* The speech of the messenger in the *Antigone*, the speeches of Hyllus and the Nurse in the *Trachiniæ*, occur at the supreme crises of the two dramas Yet there is no sense of any retardation in the action by the report of what has been happening elsewhere Much rather the audience are carried breathlessly along, while each speaker brings before their mental vision the scene of which he had himself been part It is a drama within the drama, an action rising from its starting point in rapid climax, swift, full, concentrated, until that wave subsides, and is followed by a moment of thrilling expectation Nor is this all The narrative of the messenger is overheard by Eurydice, that of Hyllus is heard by Deianira, that of Nurse by the chorus of Maidens And in each case a poignancy of tragic significance is added by this circumstance, while the ῥῆσις in the *Antigone*, and that of Hyllus in a yet higher degree, bind together in one the twofold interest of an action which might otherwise seem in danger of distracting the spectator

So profound is the contrivance, or, to speak more accurately, such is the strength of central feeling and conception, which secures the grace of unity in complexity to the Sophoclean drama

The proportion of the lyrics to the level dialogue is considerably less on the average in Sophocles than in Æschylus, as might be expected from the development of the purely dramatic element, and the consequent subordination of the chorus to the protagonist In the seven extant plays the lyrical portion ranges from one-fifth to nearly one-third, being highest in the *Antigone* and lowest in the *Œdipus Tyrannus* The distribution of the lyrical parts is still more widely diversified In the *Electra*, for instance, the chorus has less to do than in the *Œdipus Tyrannus*, although in the former the lyrics constitute one-fourth, and in the latter only one-fifth of the whole But then the part of Electra is favourable to lyrical outbursts, whereas it is only after the tragic change that Œdipus can appropriately pass from the stately senarius to the broken language of the dochmiac and the "lamenting" anapæst The protagonists of the *Ajax* and the *Philoctetes* had also large opportunities for vocal display

The union of strict symmetry with freedom and variety which is throughout characteristic of the work of Sophocles is especially noticeable in his handling of the tragic metres In the iambics of his dialogue, as compared with those of Æschylus, there is an advance which may be compared with the transition from "Marlowe's mighty line" to the subtler harmonies of Shakespeare Felicitous pauses, the linking on of line to line, trisyllabic feet introduced for special effects, alliteration both hard and soft, length of speeches artfully suited to character and situations, adaptation of the cæsura to the feeling expressed, are some of the points which occur most readily in thinking of his *senarii*. A minute speciality may be noted as illustrative of his manner in this respect Where a line is broken by a pause towards the end, and the latter phrase runs on into the following line, elision sometimes takes place between the lines, *e g* (*Œd Tyr*, 332-3) —

Ἐγὼ οὔτ' ἐμαυτὸν οὔτε σ' αλγυνῶ τί ταῦτ'
ἄλλως ἐλέγχεις,

This is called *synaphea*, and is peculiar to Sophocles

He differentiates more than Æschylus does between the metres to be employed in the κομμοί (including the κομματικά) and in the choral odes The dochmius, cretic, and free anapæst are employed chiefly in the κομμοί In the stasima he has greatly developed the use of logaœdic and particularly of glyconic rhythms, and far less frequently than his predecessor indulges in long continuous runs of dactyls or trochees The light trochaic line -́ ⏑ – ⏑ -́ ⏑ –, so frequent in Æschylus, is comparatively rare in Sophocles If, from the very severity with which the choral element is subordinated to the purely dramatic, his lyrics have neither the magnificent sweep of Æschylus nor the "linked sweetness" of Euripides, they have a concinnity and point, a directness of aim, and a truth of dramatic keeping, more perfect than is to be found in either And even in grandeur it would be hard to find many passages to bear comparison with the second stasimon, or central ode, either of the *Antigone* (εὐδαίμονες οἶσι κακῶν) or the first *Œdipus* (εἴ μοι ξυνείη φέροντι) Nor does anything in Euripides equal in grace and sweetness the famous eulogy on Colonus (the poet's birthplace) in the *Œdipus Coloneus*

Sophocles was edited (probably from the Venetian MSS) by Aldus Manutius, with the help of Musurus, in 1502 The Juntine editions, in which the text of Aldus was slightly modified with the help of Florentine MSS, were published in 1522, 1547, respectively An edition of the Scholia, very nearly corresponding to those on the margin of the Medicean or chief Laurentian MS (La or L) had previously appeared at Rome in 1518 The first great modification of the text was due to Turnebus, who had access to the Parisian MSS, but he was not fortunate in his selection The earliest editors had been aware that the traditional arrangement of the metres was faulty, but little way had been made towards a readjustment Now it so happens that the Parisian MS T, which is a copy of the recension of Triclinius, an early 14th century scholar, contains also the metrical views of the same editor, and, having found (as he erroneously supposed) a sound authority, Turnebus blindly adopted it, and was followed in this by H Stephanus (1568), Capperonier, and Vauvilliers in France, and Canter in Holland (who was the first to mark the correspondence of strophe and antistrophe) This error was to a large extent corrected by Brunck (1786), who rightly preferred Par A (2712), a 13th-century MS, belonging, as it happened, to the same family with Ven 467, which Aldus had mainly followed Thus after nearly three centuries the text returned (though with many conjectural variations, some of which were due to Scaliger, Auratus, and other earlier scholars) into nearly the same channel as at first Meanwhile the study of Greek metres had greatly advanced, and, while much licence was given to conjecture (in which Valckenaer and Porson were especially happy), documentary evidence was also better weighed and sifted The collation of the Laurentian MS by Peter Elmsley in 1825 (with his transcription of the Scholia) may be said to mark the most important epoch in the textual criticism of Sophocles But the great work of Gottfried Hermann, whose editions (1823-1830), which are critical in every sense of the word, are adorned with an ample Latin commentary, made perhaps the longest step in advance Since Hermann the editors of Sophocles have been very numerous The list, from Schneidewin to Wecklein and Pappageorgius amongst Continental scholars and from Linwood to Jebb (who is last, not least) amongst our own, is too long for insertion here (L C)

SOPHRON of Syracuse, next to Epicharmus the greatest representative of Sicilian comedy, flourished about 430 B C He was the author of mimes, written in prose, containing both male and female characters—Μῖμοι ἀνδρεῖοι and Μῖμοι γυναικεῖοι—and depicting scenes from the daily life of the Sicilian Greeks From the extremely scanty fragments which remain of his writings we can only see that he used the local dialect, frequently sacrificing refinement to vigour, he sometimes reminds us of Plautus in his employment of bold and expressive figures and turns of expression But we can judge of the dramatic power

and vivacity of his compositions from the story that Plato first introduced them to Athens, and studied them in order to give animation to his own dialogues, and some idea of the general character of his mimes may be derived from the 2d and 15th idyls of Theocritus, which are said to have been imitated from the 'Ακέστριαι and 'Ισθμιάζουσαι of his Syracusan predecessor

The fragments of Sophron, most of which have been preserved to illustrate some point of grammar or dialect, are collected in Ahrens, *De Græcæ Linguæ Dialectis*, vol ii pp 464–476

SOPRON See OEDENBURG

SORA, a city of Italy, at the head of a circondario in the province of Caserta (Terra di Lavoro), is built in a plain on the banks of the Garigliano and on the highway from Rome *via* Tivoli and Avezzano to Naples It is the seat of important manufactures,—wool-spinning, cloth-weaving, and paper-making,—this last industry dating from the time of Murat The original cathedral, consecrated by Pope Adrian IV in 1155, was destroyed by the earthquake of 1634 The population of the city was 8768 in 1861 and 5411 (commune 13,208) in 1881

Sora, an ancient Volscian town, was thrice captured by the Romans, in 345, 314, and 305 B C, before they managed, in 303, by means of a colony 4000 strong, to confirm its annexation In 209 it was one of the colonies which refused further contributions By the lex Julia it became a municipium, but under Augustus it was colonized by soldiers of the 4th legion The castle of Sorella, built on the rocky height above the town, was in the Middle Ages a stronghold of some note, on one occasion it held out successfully against a whole year's vigorous siege by William II of Sicily Alfonso of Aragon made Sora a duchy for the Cantelmi, it was afterwards seized by Pius II, but, being restored to the Cantelmi by Sixtus IV, it ultimately passed to the Della Rovere of Urbino Against Cæsar Borgia the city was heroically defended by Giovanni di Montefeltro Captured by the marquis of Pescara for Charles V, it was by him bestowed on Carlo Ceares, duke of Croy and Arescot, but, Ceares being afterwards bought out, the duchy was restored to the duke of Urbino By Gregory XIII it was purchased for 11,000 ducats and bestowed on his son Buoncompagni, the ancestor of the line of Buoncompagni-Ludovisi In ancient times Sora was the birthplace of the Decii, Attilius Regulus, and Lucius Mummius, and of its modern celebrities Cardinal Baronius is one The now ruined abbey church of San Domenico, founded in 1104 on the left bank of the Liri above the town, is believed to occupy the site of Cicero's family villa and birthplace It consisted of a nave and two aisles, all ending in circular apses

SORAU, an industrial town and railway junction in the south of Brandenburg, Prussia, is situated 54 miles to the south-east of Frankfort-on-the-Oder, and not far from the Silesian border Said to be one of the oldest towns in Lower Lusatia, Sorau contains a number of ancient buildings, among which the most prominent are several of the churches (one dating from 1204), the town-house, built in 1260, and the old palace of 1207 The new palace was erected in 1711 The varied manufactures of the town comprise cloth, linen, wax candles, starch, bone-meal, &c The population, 3764 in 1816, was 13,668 in 1885, upwards of 12,000 of them being Lutherans

Sorau is said to have existed in 840 and to have belonged to the abbey of Fulda till the 12th century It received town-rights in 1260 With the surrounding district, known as the barony of Sorau, it became the seat of successive noble families, and in 1400 it was united with the barony of Triebel The last count of Promnitz, whose ancestor had purchased both baronies from Frederick of Bohemia in 1556, sold them to the elector of Saxony for an annuity of 12,000 thalers (£1800) In 1815 Saxony had to cede them to Prussia, after holding them for fifty years

SORBONNE, the name formerly borne by the old faculty of theology in Paris, and now applied to the seat of the *académie* of that city and of the three faculties of theology, science, and literature (See FRANCE, vol ix p 513, PARIS, vol xviii p 281, and UNIVERSITIES) The Sorbonne owes its origin and its name to Robert de Sorbon, a poor priest of Champagne, who, arriving in Paris about the beginning of the reign of St Louis, attained high repute by his sanctity and eloquence, and was appointed by the king to be his chaplain Assisted by royal liberality, he built upon Mont Sainte-Geneviève a modest establishment in which were accommodated seven priests charged with the duty of teaching theology gratuitously, to this he added a college of preparatory studies, all under the direction of a provisor, under whom was an annual prior who had the actual management The new institution was authorized by letters patent of 1255, and canonically sanctioned by Pope Alexander IV in 1259 Destined originally for poor students, the Sorbonne soon became a meeting-place for all the students of the university of Paris, who resorted thither to hear the lectures of the most learned theologians of the period,—Guillaume de Saint-Amour, Eudes de Douai, Laurent l'Anglais, Pierre d'Ailly At the close of the century it was organized into a full faculty of theology, and under this definitive form it conferred bachelor's, licentiate's, and doctor's degrees, and the severity of its examinations gave an exceptional value to its diplomas The so-called "thèse Sorbonique," instituted towards the beginning of the 14th century, became the type of its order by the length and difficulty of its tests Ultimately the professors of the Sorbonne came to be resorted to, not only for lectures and examinations, but also for dogmatic decisions and judgments in canon law, the clergy of France and of the whole Catholic world had recourse to them in difficult cases, and the Curia Romana itself more than once laid its doubts before them, giving them the title of "Concilium in Gallia subsistens" The Sorbonne took a leading part in the religious discussions which agitated France during the 16th and 18th centuries, and its influence thus inevitably extended to political questions During the insanity of Charles VI it helped to bring about the absolution of Jean Sans-Peur for the assassination of the duke of Orleans Shortly afterwards it demanded and supported the condemnation of Joan of Arc, during the Reformation it was the animating spirit of all the persecutions directed against Protestants and unbelievers without having advised the massacre of St Bartholomew, it did not hesitate to justify it, and it inflamed the League by its vigorous anathemas against Henry III and the king of Navarre, hesitating to recognize the latter even after his abjuration From this point dates the beginning of its decadence, and, when Richelieu in 1629 ordered the reconstruction of its church and buildings, the following prophetic couplet was circulated—

> Instaurata ruet jamjam Sorbona Caduca
> Dum fuit, inconcussa stetit, renovata peribit

The declaration of the clergy in 1682, which it subscribed, proved fatal to its authority with the Curia Romana, it revived for a short time under Louis XV during the struggle against Jansenism, but this was its last exploit, it was suppressed like the old universities in 1790 To the Sorbonne belongs the glory of having introduced printing into France in 1469 within its precincts it assigned quarters for Ulric Gering and two companions in which to set up their presses

When the university of France was organized in 1808 the Sorbonne became the seat of the *académie* of Paris, and between 1816 and 1821 the faculties of theology, science, and literature were installed there with their libraries All the great university functions are held within its great amphitheatre Since 1861 there has annually been held in the Sorbonne at Easter an official congress in which are represented the learned societies of the departments, there are five sections—those of archeology, history, the moral and political sciences, the physical sciences, geography,—which hold separate sittings The fine arts form a sixth section, with a special organization

A reconstruction of the buildings of the Sorbonne, pro-

jected by Napoleon III, was begun in 1884, under the architectural direction of Nénot. The old church containing the tomb of Richelieu is to be retained on account of its artistic merit.

SORGHUM. See MILLET.

SORIA, a province of Spain, in Old Castile, bounded on the N. by Logroño, E. by Saragossa, S. by Guadalajara, and W. by Segovia and Burgos; the area is 3836 square miles. It is a bleak and lofty region, being bounded on three sides by mountains. A range of low sierras on the north, and the great Sierra de Moncayo on the east, separate the valley of the Duero (Douro) from that of the Ebro, while on the south it is divided from that of the Tagus by a continuation of the Sierra Guadarrama. The whole of the province belongs to the region watered by the Duero and its affluents. This river rises in the northern mountains, and traverses the province in a circuitous course, first to the south and then to the west. The other rivers are mostly affluents of the Duero, such as the Tuerto, San Pedro, &c., but a few of the tributaries of the Ebro have their sources within the limits of the province. The soil is not remarkable for fertility; on the contrary, a large proportion of the area is occupied with barren mountains, which are covered with snow for a great part of the year. There are, however, in some places extensive forests of pine, oak, and beech; while in others there are large tracts of pasture land, on which numbers of cattle, sheep, and swine are reared. Grain and vegetables are raised, but neither of very good quality nor in sufficient quantities to supply the wants of the population. The climate is cold and dry, and the scenery grand, but not very pleasing in its character. Most of the people are employed in farming and rearing cattle; but the cutting and sawing of timber and the preparation of charcoal also occupy a considerable number. There is a great want of roads in this part of the country, and commerce is consequently very limited. Fine wool was formerly an important production of the province; but of late years it has considerably fallen off. The only important article of trade at present is timber, which is sent to Madrid and Aragon. Soria is divided into five partidos judiciales and 345 ayuntamientos. The population was returned in 1877 as 153,654. There is a bishop (suffragan of Burgos), resident at Osma. The only town of more than 5000 inhabitants is Soria.

SORIA, the capital of the above province, on a hill on the right bank of the Duero, 113 miles north-east of Madrid, is an ancient town, still surrounded by walls which were built in the 13th century. It contains several squares, in one of which stand the court-house and prisons and in another the spacious palace of the dukes of Gomara. The churches of Santo Domingo and San Nicolas, the cloisters of the convent of San Juan, and several other ecclesiastical buildings are fine specimens of Romanesque work of the 12th and 13th centuries. The population is chiefly agricultural; but there are also flour-mills, tanneries, potteries, &c., and some trade in timber, wool, and fruit is carried on. Three and a half miles distant is the site of the ancient Numantia. But few traces of the old city, however, remain. A railway has long been projected between Soria and Calatayud, upon the Madrid and Saragossa line. The population in 1877 was 6286.

SORREL. See HORTICULTURE, vol. xii. p. 288.

SORRENTO, a city of Italy, in the province of Naples, on the north side of the peninsula that separates the Bay of Naples from the Bay of Salerno, about 1½ miles to the east of Capo di Sorrento, crowned by the ruins of a temple of Neptune. Sorrento contains only a few unimportant remains of the magnificent buildings which made it in the time of Augustus a finer city than Naples; and its present prosperity depends mainly on the reputation it enjoys as a summer watering-place, with a delightful and healthy climate, and situated amid picturesque coast scenery. The chief local industry is the inlaying of wood. In ancient times the Surrentine wines had a great repute. The population was 4254 in 1861 and 6089 in 1881.

Surrentum was of very ancient origin, but it does not appear frequently in history. A famous temple of Minerva stood on the Promontorium Surrentinum (now Punta della Campanella). In 1558 the corsair Pialy attacked the town and carried off 2000 prisoners. Statius celebrated the delights of the Surrentine villa owned by his friend Pollius Felix; it was at Sorrento that Bernardo Tasso wrote his *Amadigi*, and Torquato Tasso was born in the town in 1544.

SOSIGENES, the astronomer who was employed by Julius Cæsar to reform the Roman calendar, 46 B.C. (see CALENDAR). Of his life nothing further is known, with the exception of two references to him by Pliny, which show that he left some astronomical treatises. The chief one is as follows:—

"Tres autem fuere sectæ, Chaldæa, Ægyptia, Græca. His addidit quartam apud nos Cæsar dictator annos ad solis cursum redigens singulos, Sosigene perito scientiæ ejus adhibito; et ea ipsa ratio postea comperto errore correcta est, ita ut XII. annis continuis non intercalaretur, quia cœperat sidera annus morari qui prius antecedebat. Et Sosigenes ipse trinis commentationibus, quamquam diligentior ceteris, non cessavit tamen addubitare ipse semet corrigendo."—*H. N.*, xviii. 25.

From another passage (*H. N.*, ii. 8) we infer that Sosigenes maintained that Mercury moved in an epicycle about the sun; this doctrine is referred to by his contemporary Cicero, and it was also that of the Egyptians (see PTOLEMY). Sosigenes is commonly called an Egyptian and a Peripatetic, but this has arisen from his having been confounded with a Peripatetic philosopher of the same name who lived in the 2d century of the Christian era, and who will be briefly noticed below. It is most probable, however, that he was a Greek of Alexandria, for the following reasons. (1) Cæsar had just returned victorious from his Alexandrian expedition, which occupied parts of the years 48 and 47 B.C., when, with the assistance of Sosigenes, he settled the chronological question. (2) We learn from Plutarch (*Cæs.*, 59) that "Cæsar laid the problem (viz., the correction of the calendar) before the ablest philosophers and mathematicians," and at that time the school of Alexandria was world-famous. (3) We know that Cæsar was himself a diligent student of astronomy. Lucan, in a passage which refers to his correction of the calendar, represents him as saying that even in the midst of his campaigns he had always found time for astronomical pursuits:—

"media inter prœlia semper
Stellarum cœlique plagis superisque vacavi;
Nec meus Eudoxi vincetur Fastibus annus."—x. 185-7.

(4) Macrobius says that Cæsar wrote a work on the motion of the stars, and expressly states, moreover, that he derived from the Egyptian schools his information on this subject, and also what he required for the correction of the calendar.[1] (5) Cæsar's arrangement was substantially the same as the reform of the Egyptian calendar in the year 238 B.C. under Ptolemy III. Euergetes, a fact which remained unknown until the discovery of the Decree of Canopus by Lepsius at Sanor Tanis in Egypt in the year 1866.

Zeller (*Phil. d. Gr.*, vol. iii. part 1, 2d ed., p. 705-6, note of p. 703, and p. 694, note 3), and after him, but in a more complete manner, Th. H. Martin (*Annales* de la Faculté des Lettres de Bordeaux, 2e fasc., 1879), have shown, in opposition to the prevailing opinion, which had been formerly held by Zeller himself, that

[1] "Nec mirum si hæc digeries morsum reprehensionis evasit, cui accessita est ab Ægypto postremæ correctionis auctoritas. Nam Julius Cæsar, ut siderum motus, de quibus non indoctos libros reliquit, ab Ægyptiis disciplinis hausit, ita hoc quoque ex eadem institutione mutuatus est, ut ad solis cursum finiendi anni tempus extenderet."—*Sat.*, i. 16.

the subject of this article has nothing in common but the name with Sosigenes the Peripatetic philosopher, author of a work on restituent spheres (Σωσιγένης περὶ τῶν ἀνελιττουσῶν [σφαιρῶν]), which is referred to by Proclus (*Hypotyp*, p 111, ed Halma) and followed by Simplicius in his *Commentary* on the treatise of Aristotle, *De Cælo*, author also of some other works, and master of Alexander of Aphrodisias, who lived at the end of the 2d and beginning of the 3d century after Christ, and who was the most celebrated of the commentators on Aristotle

SOTO See De Soto

SOUBISE, Benjamin de Rohan, Duc de (*c* 1589–1641), was the second son of Rene II, Vicomte de Rohan, and Catherine de Parthenay, and the younger brother of the soldier-writer Henri de Rohan (*q v*) The seigneury of Soubise came to the Rohans through Catherine, and Benjamin took the title as her second son The exact date of his birth does not seem to be known, but it is believed to be 1589 He served his apprenticeship as a soldier under Prince Maurice of Orange in the Low Countries But he hardly becomes an historical character before 1621, when the religious wars once more broke out in France He and his brother Rohan were the soul of the Huguenot party,—the elder brother chiefly taking command on land and in the south, Soubise in the west and along the sea-coast His exploits in the conflict have been sympathetically related by his brother, who, if he was not quite an impartial witness, was one of the best military critics of the time Soubise's chief performance was a singularly bold and well-conducted attack (in 1625) on the royalist fleet in the river Blavet (which included the cutting of a boom in the face of superior numbers after a style suggestive of the best days of the English navy) and the occupation of Oleron Soubise commanded at Rochelle during the famous siege, and if we may believe his brother the failure of the defence and of the English attack on Rhé was mainly due to the alternate obstinacy of the townsfolk and the English commanders in refusing to listen to Soubise's advice When surrender became inevitable he fled to England, which he had previously visited in quest of succour He died in 1641, and his title afterwards served as the chief second designation (not for heirs-apparent, but for the chief collateral branch for the time being) of the house of Rohan-Chabot, into which the older Rohan honours were carried by his niece Marguerite four years after his death

SOUBISE, Charles de Rohan, Prince de (1715–1787), peer and marshal of France, grandson of the Princesse de Soubise, who is known to history as one of the mistresses of Louis XIV, was born in Paris on July 15, 1715 He accompanied Louis XV in the campaign of 1744–48, and attained high military rank, which he owed more to his courtiership than to his generalship Soon after the beginning of the Seven Years' War, through the influence of Madame de Pompadour, he was put in command of a corps of 24,000 men, and on 4th November 1757 he sustained the crushing defeat of Rossbach (see vol ix pp 588–591, where also some subsequent and more favourable episodes of his military career are briefly indicated) After 1763 he lived the life of an ordinary courtier in Paris, dying on July 4, 1787

SOUDAN, or Súdán (Bilád es-Súdán, "Country of the Blacks"), a term applied by mediæval Arab geographers to the region of Africa south of the Sahara mainly inhabited by peoples of Negro blood, hence corresponding to the expressions Nigritia, Negroland, at one time current amongst European writers It lies mainly between 5° and 18° N lat, consequently entirely within the tropics, and in its widest sense stretches right across the continent from Cape Verd on the Atlantic to Massowah on the Red Sea But the term is more usually restricted to the region bounded N by the Sahara, S by Upper Guinea and the lands draining to the Congo basin, W and E by Senegambia and the Abyssinian highlands respectively (see vol i plate II) Within these limits it has an extreme length of about 3000 miles between the Senegal river and Abyssinia, extending southwards at some points 660 miles, with a total area of perhaps 2,000,000 square miles, and a population approximately estimated at from 80 to 90 millions From the arid and sandy northern wastes to the well-watered and arable Soudanese lands the transition is effected by an intermediate zone of level grassy steppes, partly overgrown with mimosas and acacias, with a mean breadth of about 60 miles, between 17° and 18° N lat, but towards the centre reaching as far south as 15° N Excluding this somewhat uniform transitional zone, the Soudan, properly so called, may be described as a moderately elevated region, diversified with extensive open or rolling plains, level plateaus, and even true highlands, especially in the south-west It constitutes three distinct hydrographic systems, corresponding to the three main physical divisions of Western Soudan, draining through the Niger southwards to the Atlantic, Central Soudan, draining to the great central depression and land-locked basin of Lake Tchad, and Eastern (Egyptian) Soudan, draining through the Nile northwards to the Mediterranean Between these systems the chief water-partings are—(1) the Marrah Mountains of Dar-Fur, whence flow the Bahr es-Salamat west to the Shari, and numerous intermittent wadies east to the Nile, (2) the Monbuttu uplands (Mount Baginze), separating the western head-streams of the White Nile from the Welle (Bahr Kuta), which, according to the latest information, flows, not to the Shari as Schweinfurth supposed, but to the Congo through the Mbangi, (3) the so-called "Kong" Mountains, dividing the Niger basin from the Volta and other streams flowing in independent channels south to the Gulf of Guinea The Adamawa highlands, culminating in Mount Alantika (9000 to 10,000 feet), do not form a divide, as was supposed, between the Binue (the main eastern tributary of the Niger) and the Logon and other streams flowing east to the Shari (the great southern affluent of Lake Tchad) Flegel, who has recently explored the upper course of the Binue, found that it sweeps right round the east foot of Mount Alantika, and is even navigable round this bend and some way southwards On the other hand, the central hydrographic system of Lake Tchad has been greatly reduced in size since Lupton, Grenfell, and other recent explorers have made it evident that the Bahr-Kuta (Welle) flows not to the Shari but to the Congo basin The Shari basin, which is now known not to reach farther south than about 6° N lat, may even be almost considered, physically as well as politically, as subsidiary to the Niger hydrographic system, for there are indications that the Logon once flowed into the Binue by the Mayo-Kebbi The Mayo-Kebbi is a long flat trough or valley in 9° 30′ N lat, with a level swamp at the bottom receiving as a backwater the overflow of the Logon, and also draining through the Binue to the Niger By canalizing the Mayo-Kebbi the Binue and Shari basins might be permanently connected, in which case the Niger system would afford a navigable waterway from the Gulf of Guinea to the southernmost limits of Baghirmi

From the Kong highlands, some of whose peaks appear to attain elevations of 6000 to 7000 feet, Western Soudan falls gradually towards the north and north-east down to the Great Desert, where the city of Timbuktu still maintains an altitude of 770 feet above sea-level (Lenz) South-east of the Niger the land rises in terraces of 1000 and even 3000 feet, above which isolated crests range from 5000 to 9000 feet This little-known western highland region, comprised between the Binue and the lower Niger,

and extending from Adamawa to the Cameroons on the Bight of Biafra, corresponds with the eastern highland region of Abyssinia, lying between the Blue Nile and the Tagazze and dominating the Red Sea. North of Adamawa the land falls rapidly down to the vast depression of Central Soudan, whose lowest part is flooded with the waters of Lake Tchad (Chad or Tsad), the largest area of inland drainage, next to the Aral-Caspian basin, in the eastern hemisphere. This freshwater lacustrine depression, usually 10,000 square miles in extent, expands to 40,000 and even 50,000 square miles when swollen by the flood-waters of its great feeders,—the Logon-Shari from the south and the Komadugu from the west. From the Tchad depression, which is still 1150 feet above the sea, the ground rises again eastwards in the direction of Wadai and Dar-Fur, to heights of 3000 feet and upwards, culminating in the volcanic Jebel Marrah (6000 feet), which forms the natural eastern limit of Central Soudan, and the great divide between the Tchad and Nile basins. But politically the line between Central and Eastern Soudan is usually drawn more to the west along the conventional frontiers of Wadai and Dar-Fur, the latter province, although never completely reduced, being claimed as part of Egyptian Soudan. This region constitutes two distinct physical divisions,—the first comprising the provinces of Dar-Fur and Kordofan, bounded E. by the White Nile and S. by the Bahr el-Arab, a tableland in which the steppe formation predominates, while the second is skirted east by the Bahr el-Jebel and stretches from the Bahr el-Arab southwards to the Monbuttu uplands, a vast plain watered by the numerous south-western headstreams of the White Nile. This plain rises gradually towards the south and south-west to the highlands, which appear to culminate in Mount Baginze, and which form the water-parting between the Nile and Congo basins. Included in Eastern Soudan is also the extensive plain of Senaar, stretching from the Nile eastwards to the Abyssinian uplands, and rising southwards to the Fazokl and Berta highlands.

The prevailing geological formations are the crystalline rocks, such as granites, diorites, slates, gneiss, underlying the old and new alluvia of the plains, and found associated with sandstones in the highlands. In the Kong Mountains the granites underlie the sandstones, but in the Tagale group (South Kordofan) they pass over to porphyries and syenites, interspersed with extensive diorites and auriferous quartz veins. Volcanic rocks (basalts, lavas, tufas) appear to be restricted to the isolated Defafaung and Alantika Mountains (Adamawa), although solfataras occur in the Tagalé district, where sulphur abounds. Mineral waters are also found in Dar-Fur and Adamawa. The most widely diffused minerals are iron and copper, the oxides of iron occurring almost everywhere from the White Nile to the Niger, while pure copper is met especially in Dar Fur and Fertit. Gold is chiefly restricted to the Tagalé and Kong Mountains, Bambarra, and Adamawa; and lead, antimony, and tin are confined to a few isolated districts. Characteristic is the apparently total absence of limestones, coal, salt, and natron, the supplies of salt being imported mainly from the Sahara. Report, however, speaks of a large lake in the Jebel Marrah, from which salt is obtained.

The climate of Soudan is distinctly tropical, with two well-defined seasons, hot and rainy from April or May to October, warm and dry for the rest of the year. The former is accompanied by tremendous thunderstorms and continuous downpours flushing all the khors, wadies, and other watercourses, flooding large tracts along the lower courses of the Shari, Logon, Komadugu, and Niger, and interrupting the communications for weeks together in Baghirmi and Bornu. Before the rains set in the glass seldom falls below 98° or 100° F., rising at noon to 104°, while the mean annual temperature at Kuka (Bornu) is about 82° F. But in the dry season it is often lowered to 58° or 60°, and under the influence of the cool north-east winds water often freezes on the uplands, snow falls in Dar-Fur, and fires are kept up in the houses in the central districts of Kano. The chief ailments are ague and other marsh fevers in the low-lying tracts subject to inundations, the Guinea worm, cutaneous diseases, and leprosy. The fevers are dangerous alike to Europeans and natives.

An exuberant forest vegetation is favoured by the rich alluvial soil and tropical heat wherever moisture abounds. Of large growths the most characteristic and widespread are—the baobab (*Adansonia*), reaching north to the 13th parallel and attaining a girth of 80 feet; the superb deleb palm, covering extensive tracts especially in the east, where it grows to a height of over 120 feet; the shea or butter tree (*Bassia butyracea*), in the Niger basin and Kong uplands; the cotton tree, dum palm, tamarind, several varieties of euphorbias, acacias, and mimosas, the heglyg (*Balanites ægyptiaca*), and jerjak of Wadai, which yields a kind of vegetable honey. Owing to the absence of salt the date-palm is very rare. The chief cultivated plants are cotton, maize, several kinds of durrah (*Sorghum vulgare*, *S. cernuum*, &c.), hemp, tobacco, gourds, water-melons, indigo (of excellent quality and growing everywhere, wild and cultivated), and lastly the guru or kola nut (*Sterculia acuminata* and *S. macrocarpa*), which in Soudan takes the place of the coffee berry. Cotton of the finest quality has been raised on the rich alluvial plain of Taka and Senaar.

The beasts of prey, nowhere very numerous, are chiefly represented by the lion, panther, hyæna, and jackal. Elephants in herds of 400 or 500 frequent the swampy districts about Lake Tchad, but are not found farther north than the 12th or 13th parallel. The ordinary African rhinoceros is common, and the rare one-horned species appears to have been met with in Wadai. The wild ass, zebra, giraffe, and antelopes in considerable variety abound on the eastern steppe lands, and endless species of monkeys in the forest districts. Crocodiles, some of great size, from 16 to 18 feet long, infest all the large rivers, the sangwar,—a web-footed variety, occurring in the Niger. The hippopotamus also abounds in these waters, which teem with fish, mostly of unknown species. These attract numerous flocks of waterfowl,—pelicans, spoonbills, cranes, ducks, and many unknown species. In the Tchad, Fittri, and other districts the fish are captured, dried, and exported in large quantities to Fezzan and the countries beyond the Niger. Flies and mosquitoes swarm in the marshy, and locusts in the dry districts; and in the woodlands insect life is represented by myriads of termites and some very large species of bees, wasps, and ants, besides beetles and butterflies in considerable variety.

The term Bílad es Súdán is fully justified by the ethnical conditions of this region, which may be regarded as the true home of the Negro variety of mankind. Here this still everywhere forms the substratum of the population, constituting the distinct aboriginal element, in many places exclusively, in others intermingled with foreign intruders from the north and east. As far as can now be determined, these intruders belong to two separate branches of the Caucasic stock—the Hamitic and the Semitic. The Hamitic is represented by three divisions—Fulahs,[1] Tibus, and Berbers—all of whom arrived in remote prehistoric times; the Semitic by one division—the Arabs, who arrived at various periods since the spread of Islam in North Africa. The bulk of the Arab tribes appear to have penetrated from the Nile basin through Kordofan to Dar-Fur and Wadai, or from the Mediterranean seaboard through Fezzan and across the Sahara to the Tchad basin, and hence are still mostly restricted to the central and eastern districts. Owing to their later appearance and stronger racial sentiment they have kept more aloof from the surrounding populations than the Hamites, who have everywhere intermingled with the aboriginal Negro element. The result is that the present inhabitants of Soudan are of a very mixed character,—more or less pure Negro peoples predominating in the Niger basin, in Adamawa, Baghirmi, Wadai, parts of Dar-Fur and Kordofan, and in the Nile basin south of 10° north latitude; half-caste Negroes and Fulahs especially in Western Soudan; half-caste Negroes and Berbers in the northern districts of Western and Central Soudan; half-caste Negroes and Tibus (Dasas) mainly in Kanem and Bornu; true Fulahs scattered in isolated groups between the Niger and Tchad basins; true Berbers (Tuaregs) in the Timbuktu and Moassina districts; true Arabs chiefly in Baghirmi, Wadai, Dar-Fur, and Kordofan.

In the subjoined table of the chief Soudanese races the Negro divisions have little more than a linguistic value.

Negro and Negroid Peoples.

Mandingoes. Mandinka, Malinka, and in the east Vangarawa, the dominant race between the Joliba (Upper Niger) and Kong Mountains, where their simple and harmonious speech is everywhere current as the chief medium of intercourse; fine Negro type, tall, very dark complexion from coffee brown to black, long frizzly and woolly hair; agriculturists and traders, mostly Mohammedans outwardly; population six to eight millions. Chief subdivision the Bambarras, whose capital is Sego on the Joliba; population 2,000,000.

[1] Most ethnologists, adopting Fr. Müller's general classification, group the Fulahs with the Nubians in a separate division ("Nuba-Fulah family"), and class the Tibus as Negroes. But more recent research has shown—(1) that the Fulahs and Nubians differ fundamentally in speech and physique, the former being of Caucasic and the latter of Negro type (Krause, Rüppel), and (2) that the true Tibus, the Tedas of Tibesti as distinguished from the Dasas or southern group, are not Negroes but Hamites, akin to the Tuaregs of the Western Sahara, although the two languages are totally distinct (Nachtigal). The Tibu language has been described as a Negro form of speech; but this is also a mistake. It forms an independent linguistic group, the oldest and purest branch of which is that of the Northern Tedas. From Tibesti it appears to have spread southwards to Kanem and Bornu, where the Dasa, Kanuri, and other dialects have been exposed to Negro influences. Had Tibu been originally a Negro language, its most primitive form would be found, not in Tibesti, but in Soudan, and its progress would have been thence northwards, not from the Sahara southwards.

Sonrhai or *Songhai*. An historical race whose empire stretched in the 16th century from the northern bend of the Niger to the Atlantic and Morocco, speech of a monosyllabic type, still current in the Timbuktu district and oases of Western Sahara, population 2,000,000.

Tombo, Mosso, Gurma. Three little known Negro peoples west of the Niger, within the great bend, affinities uncertain, form semi independent petty states, apparently tributary to Moassina and Gando.

Nupe or *Nufe*. Large Negro nation along both sides of the Niger from Rabba to the Binue confluence, subject to Gando.

Yoruba. Powerful Negro people between lower Niger and Dahomey, capital Ilorin, Mohammedans, pagans, and Christians (Protestant).

Batta. The chief Negro people in Adamawa, now subject to the Fulahs, pagans and Mohammedans.

Haussa. Largest, most widespread, and intelligent of all the Sudanese Negro peoples, mainly between the Niger and Bornu, speech very musical, the chief commercial medium in Western and Central Soudan, and current in parts of Tripolitana, shows distinct traces of Hamitic influences (Krause), mostly Mohammedans.

Mosgu or *Masa*. Widespread Negro family between Lake Tchad and Adamawa and stretching east to the Shari, chief subdivisions—Mandara, Margi, Logon, Gamergu, Margomi, Keribina, mostly pagans and uncultured.

Yedina (Buduma) and *Kuri*. Predatory Negro tribes in the islands of Lake Tchad, appear to be related to the Kolokos or Mekari of Logon and Bornu, nominal Mohammedans, population 30,000.

Baghirmi. The dominant people in Baghirmi, cultured Mohammedans, very industrious and skilled weavers and dyers, population over a million.

Maba. The chief Negro nation in Wadai, mainly in the Wara and Abeshr districts, about the headstreams of the Batha.

Fur or *For*. The dominant race in Dar-Fur, which takes its name from them, akin to the Nubas, chief subdivision Kunjara.

Nubas. Large Negro nation, Jebel Nuba, and other parts of Kordofan, the original stock of the Nile Nubians, chief subdivisions—Kargo, Kulfan, Kolaji, Tumali.

Nilotic Negroes. Shulluks, Dinkas, Bongos, Baris, A-Madi (Mittu), and many others about the Bahr el Jebel and south western tributaries of the White Nile.

Funj. A very mixed Negroid race, Senaar.

Hamites—Pure and Mixed

Tuaregs. A main branch of the Berber race, dominant throughout the Western Sahara and southern steppes, powerful, especially in the Timbuktu district and on the north frontier of Bornu.

Soninka or *Assuanek*. Called also Serakuli or Serral olet, *i e*, "white people," half caste Tuareg and Negro nation scattered in small communities from the Niger to the Atlantic, and numerous especially in Senegambia and Moassina, cultured Mohammedans, and active traders.

Fulahs. The most powerful, intelligent, and widespread of all the Soudanese peoples, from their original home in Senegambia (Futa Toro, Futa Jallo) have spread since the 18th century throughout Western and Central Soudan, and as far east as Dar-Fur, everywhere propagating Islam, overthrowing the native Haussa and other states, and founding new kingdoms in the Niger basin, in Adamawa, and Central Soudan, are called Fellani by the Haussas, Fulán by the Arabs, Felláta by the Kanuri, the term meaning "fair" or "light coloured", pure type, distinctly Caucasic, regular features, long black hair, brown or ruddy complexion, slim well-proportioned figures, but the language, which presents several remarkable features, shows only faint traces of Berber influence, and appears on the whole to be essentially a Negro form of speech, adopted probably during residence from the remotest times in Negroland, population seven to eight millions.

Dasas. The southern branch of the Tibus, chiefly in Kanem and northern Bornu, type and speech show distinct Negro influences.

Kanembu. The people of Kanem, with settlements in eastern Bornu, also originally Tibus, but betraying still more decided Negro influence.

Kanuri. The ruling race in Bornu, speech a development of the Dasa and Kanem, type half caste Tibu and Negro.

Zoghawa, Baele, Ennedi. Mixed Tibu and Negro tribes, northern Dar Fur, originally from Borku and Wanganya, Eastern Sahara, speech akin to Dasa.

Semites

Aulad Soleiman Arabs. In Kanem.
Aulad Rashid, Mahamid. South-east of Borku, and in Dar-Fur.
Salamat, Aulad Hamed. Between the lower Shari and Bahr el Ghazál.
Hamr, Hamrán. Kordofan.
Kababish. "Goatherds," widespread along west side Nile, from Kordofan to Dongola.
Bakkára. "Cowherds," south of the Kababish to left bank of Bahr el Arab.

Politically Western and Central Soudan are divided into eight independent and semi-independent states, which in their order from west to east are as under:—

Bambarra, divided into two nearly equal sections by the Joliba, which traverses it from south-west to north-east, is ruled by the Negro Bambarras of Mandingo stock. It has recently been brought under the influence of the French penetrating eastwards from their possessions on the Senegal. The capital is Sego, on the right bank of the Joliba.

Moassina, Gando, Sokoto, Adamawa, the four so-called "Fulah States," occupy the Niger basin between Bambara and the Binue confluence, the whole of the Binue basin, and the region lying between the Niger and Bornu. *Moassina* (Massina) lies on both banks of the Niger from Bambaria to Kabara, the port of Timbuktu, and is peopled by Fulahs, Bambarras, and Sonrhais, capital Hamda-Alahi, on the right bank of the Niger, below Jenne, which is its chief trading place. Timbuktu, with surrounding district constitutes a separate territory governed by a kadia, or hereditary mayor, who lately sent an envoy to Paris for the purpose of seeking French protection against the rival Tuareg and Fulah tribes. *Gando*, so called from its capital on an eastern tributary of the Niger, stretches along the main stream southwards to the Binue confluence, including the Nufe territory and part of Yoruba. The lower part is extremely fertile, abounding in cotton, indigo, rice, and all varieties of African grains. It comes within the limits of the region over which the British protectorate has recently been extended. Besides the capital, there are several large towns, such as Bida (30,000 to 50,000 inhabitants) in the north, Rabba (40,000 to 50,000), head of the steam navigation on the Niger, and a chief station on the great trade route running from Lagos on the Guinea Coast northwards to Gando and Sokoto, Egga (8000), on the left bank of the Niger, centre of the British trade, Lokoja, facing the Binue confluence, an English factory, headquarters of an Anglican mission and seat of a Negro bishop. *Sokoto*, sometimes spoken of as the "empire of Sokoto," is the largest and most powerful of all the Soudanese states, stretching from Gando to Bornu, and from the Binue northwards to the Sahara (see SOKOTO). In it are absorbed all the former "Haussa States," and to it Adamawa is also tributary. The inhabitants are chiefly Fulahs and Haussas, intermixed with many aboriginal Negro peoples, especially in the south and south east. The land is generally fertile, yielding rich crops of cereals, cotton, tobacco, indigo, sugar, yams, black pepper, ginger, melons. The capital and residence of the sultan is Sokoto, in the extreme north west. Other large towns are—Katsena, before the Fulah invasion a place of 100,000 inhabitants, now reduced to 7000, Kano, in Barth's time the "London of Soudan," and still with 50,000 souls (Matteucci), Wurnu (15,000), Gombe, in the province of Calam (20,000), Yakoba, or Garu n-Bauchi (150,000), Keffi Abd es Senga (30,000), in Zegzeg, a great centre of the ivory trade, and converging point of the two great caravan routes from the north (Kano) and the west (Egga). *Adamaua*, so named from its Fulah conqueror Adama, and formerly known as Fumbina, or "Southland," is ruled by a Fulah vassal of Sokoto, who keeps in subjection the Battas and innumerable other Negro peoples, it lies between Sokoto, Bornu, and Baghirmi, merging southwards in the unexplored equatorial region back of the Cameroons. The capital is Yola, at the northern foot of Mount Alantika. Adamawa appears to be one of the finest and healthiest regions in Africa, splendidly diversified with lofty highlands, fertile valleys, and grassy plains, overgrown in some places with forests of bananas, baobabs, and plantains, in others yielding abundant harvests of cereals, cotton, and indigo. The horses and cattle introduced by the Fulahs thrive well on the rich pastures, and elephants abound in the woodlands.

Bornu, with *Kanem*, in the north, now reduced, and the tributary state of *Logon* in the south, completely encircles Lake Tchad, except at the south-east corner, where Baghirmi is wedged in between Logon and Wadai, it is mostly a flat low-lying region with fertile plains yielding durrah, maize, cotton, and indigo, watered by the Komadugu, Logon, and Shari, all of which flood their banks for miles during the rainy season. The ruling race are the Kanuri, cultured but fanatical Mohammedans of mixed Tibu and Negro stock. The capital of Bornu is Kuka (50,000 to 60,000 inhabitants), near the west coast of Lake Tchad, a great centre of the Soudanese trade with the Sahara and Tripolitana, and terminus of the main caravan route from Murzuk (Fezzan) across the desert to the Tchad basin, the capital of Logon is Logon-birni, residence of a vassal prince. Population of Bornu estimated at 5,000,000.

Baghirmi, a Negro state, since 1871 tributary to Wadai, comprises the rich and well-watered plains of the lower Shari, with undefined southern limits. Capital Masena, population about 1,500,000, of whom three fourths Baghirmi, the rest Kotokos, Fulahs, and Arabs.

Wadai, a powerful Mohammedan state occupying the whole region between Baghirmi and Kanem in the west and Dar-Fur in the east, and claiming exclusive ivory and slave-hunting rights in the southern (upper) Shari basin. The capital is Abeshr, on a head-stream of the Batha. The country is mainly a hilly plateau rising to 3000 feet above the sea, and yielding good crops of maize, dukhn, durrah, cotton, indigo. Population four to six millions, chiefly Mabas and other Negroes, and numerous Arab tribes, with some scattered Baghirmi, Fulah, and Kanuri settlements.

Eastern Soudan, comprising Dar-Fur, Kordofan, Senaar, Taka, and the Negro countries on the White Nile and its south-western tributaries, respectively called the Equatorial and Bahr-Gazal Provinces, belonged politically to Egypt till the rebellion of the late Mahdi. Since his death in 1885 most of these provinces appear to have lapsed into a state of anarchy and barbarism, in which few vestiges remain of the peace and order introduced by the European officers of the khedive. The Equatorial Province, however, and the Suakin district have been exempt from these troubles,—the former being still held till 1886 by the governor, Emin Bey, for the khedive, while in the latter the natives themselves succeeded in the same year in putting down the "rebels" or party of Osman Digma. For details of Eastern Soudan, see articles NILE, NUBIA, and SENAAR. (A. H. K.)

SOULT, NICOLAS JEAN DE DIEU, duke of Dalmatia and marshal of France (1769–1851), was born at Saint-Amans la-Bastide (now in department of the Tarn), on March 29, 1769, and was the elder son of a country notary at that place. He was fairly well educated, and intended for the bar, but his father's death when he was still a boy made it necessary for him to seek his fortune, and he enlisted as a private in the regiment of royal infantry in 1785. His superior education ensured his promotion to the rank of sergeant after six years' service, and in July

1791 he became instructor to the first battalion of volunteers of the Bas-Rhin. He served with his battalion in 1792, and rapidly rose to the position of adjutant-general, colonel, and chief of the staff to General Lefebvre. Soult it was who practically directed the operations of Lefebvre's division in 1794, and after the battle of Fleurus he was promoted general of brigade by the representatives on mission. For the next five years he was constantly employed in Germany under Jourdan, Moreau, Kléber, and Lefebvre. The attack of the French left at the battle of Altenkirchen, which won the day, was directed by Soult, and in 1799 he was promoted general of division and ordered to proceed to Switzerland. It was at this time that he laid the foundations of his military fame, and he particularly distinguished himself in Masséna's great Swiss campaign, and especially at the battle of Zurich. He accompanied Masséna to Genoa, and acted as his principal lieutenant throughout the protracted siege of that city, during which he operated with a detached force without the walls, and after many successful actions he was wounded and taken prisoner at Monte Cretto on 13th April 1800. The victory of Marengo restoring his freedom, he received the command of the southern part of the kingdom of Naples, and in 1802 he was appointed one of the four generals commanding the guard of the consuls. Though he was one of those generals who had served under Moreau, and who therefore, as a rule, disliked and despised Napoleon, Soult had the wisdom to show his devotion to the ruling power; in consequence he was in August 1803 appointed to the command in chief of the camp of Boulogne, and in May 1804 he was made one of the first marshals of France. When Napoleon decided to lead the troops of the camp of Boulogne into Germany, Soult took the command of the right wing, and it was by his capture of the heights of Pratzen that the great battle of Austerlitz was decided. He played a great part in all the famous battles of the grand army, except the battle of Friedland, and after the conclusion of the peace of Tilsit he returned to France and was created duke of Dalmatia. In the following year he was appointed to the command of the 2d corps of the army with which Napoleon intended to conquer Spain, and after winning the battle of Gamonal he was detailed by the emperor to pursue Sir John Moore, whom he only caught up at Coruña. For the next four years Soult remained in Spain, but it is impossible to do more than allude to his most important feats of arms. In 1809, after his defeat by Sir John Moore, he invaded Portugal and took Oporto, but, deluded by the idea of becoming king of Portugal, he neglected to advance upon Lisbon, and was eventually dislodged from Oporto by Sir Arthur Wellesley. After the battle of Talavera he was made major-general of French troops in Spain, and on 12th November 1809 won the great victory of Ocaña. In 1810 he invaded Andalusia, which he speedily reduced, with the exception of Cadiz. In 1811 he marched north into Estremadura, and took Badajoz, and when the Anglo-Portuguese army laid siege to it he marched to its rescue, and fought the famous battle of Albuera (16th May). In 1812, however, he was obliged, after Wellington's great victory of Salamanca, to evacuate Andalusia, and was soon after recalled from Spain at the request of Joseph Bonaparte, with whom he had always disagreed. In March 1813 he assumed the command of the 4th corps of the grand army and commanded the centre at Lutzen and Bautzen, but he was soon sent, with unlimited powers, to the south of France to try and repair the damages done by the great defeat of Vittoria. His campaign there is the finest proof of his genius as a general, although he was repeatedly defeated by the English under Wellington, for his soldiers were but raw conscripts, while those of Wellington were the veterans of many campaigns.

Such was the military career of Marshal Soult. His political career was by no means so creditable. After the first abdication of Napoleon he declared himself a royalist, received the order of St Louis, and acted as minister for war from 3d December 1814 to 11th March 1815. When Napoleon returned from Elba Soult at once declared himself a Bonapartist, and acted as major-general to the emperor in the campaign of Waterloo. For this conduct he was exiled, but not for long, for in 1819 he was recalled and in 1820 again made a marshal of France. He once more tried to show himself a fervent royalist and was made a peer in 1827. After the revolution of 1830 he made out that he was a partisan of Louis Philippe and constitutional royalty, and served as minister for war from 1830 to 1834, as ambassador extraordinary to London for the coronation of Queen Victoria in 1838, and again as minister for war from 1840 to 1844. In 1848, when Louis Philippe was overthrown, Soult again declared himself a republican. He died at his castle of Soultberg near his birthplace in 1851.

SOUND. See Acoustics.

SOUNDING to ascertain the depth of the sea has been practised from very early times for purposes of navigation, but it is only since the introduction of submarine telegraphy that extensive efforts have been made to obtain a complete knowledge of the contour of the ocean-bed. As early as the middle of last century a few deep soundings were recorded in various parts of the world. Ellis made one in 1749 of 891 fathoms off the north-west coast of Africa. But these early results must be accepted only with great caution, for the methods then in use were not such as to ensure accuracy at any depth greater than a few hundred fathoms. Sir John Ross, the arctic explorer, was much in advance of his times as regarded such investigations; he invented a "deep-sea clamm" for bringing up a portion of the bottom, and on September 1, 1819, in Possession Bay, made a successful sounding at a depth of 1000 fathoms, which is especially memorable because it was clear, from the organisms which came up entangled in the line, that animal life existed at that depth.

The operation of sounding is readily performed in shallow water by letting down a weight attached to a cord, which is marked off into fathoms by worsted tucked under the strands, the tens and hundreds being indicated by different colours. The bottom of the weight usually presents a hollow, which is filled with tallow, so that a portion of the material from the bottom may be brought up and give an indication of its nature. Sometimes a valved cavity is used instead of the tallow. It is easy to see that the longer the line let out the greater will be its friction in passing through the water, the more slowly the weight will descend, and the slighter will be the shock transmitted to the upper extremity when it reaches the bottom; indeed, at what are now considered very moderate depths this becomes quite imperceptible; hence in deep-sea sounding the line is carefully watched as it runs out, and the time each 100-fathom mark enters the water is noted down. Owing to the increasing friction these intervals gradually lengthen, but any sudden increment indicates that the bottom has been reached, for it shows that the weight has ceased to act, and that further descent of the line is due merely to its own gravitation. For instance, in one of the "Challenger" soundings, with a line 1 inch in circumference, and with a weight of 4 cwts. attached, the time occupied in descending from 2900 to 3000 fathoms was 2 m. 10 s.; from 3000 to 3100 fathoms 2 m. 13 s., and from 3100 to 3200 fathoms 3 m. 14 s., this sudden increase showing that the bottom had been reached in the interval.

Furthermore, the weight required to sink a line in deep

water with sufficient rapidity for purposes of accurate observation is so great that it is found impracticable to bring it up again without putting an undue strain upon the rope or seriously prolonging the operation Hence in 1854 Brooke, an American, devised an apparatus by which the weight was detached when it reached the bottom and only a small tube containing a sample of the bottom was brought up This was in fact a modification of an apparatus which had been devised by Hooke in the 17th century, he made an arrangement in which a light sphere was sunk by a heavy weight, but was liberated on reaching the bottom,—the depth being then deduced from the time which elapsed between the sinking of the globe and its reappearance at the surface Of the various modifications of Brooke's sounding machine, perhaps the most famous is that constructed by the blacksmith of H M S "Hydra," and commonly known as the "Hydra sounding rod" It was used on the cruises of the "Lightning" and "Porcupine" and during the earlier part of the "Challenger" expedition This apparatus is shown in fig 1, where AB is the rod, terminating in a tube below so that it may bring up a sample of the bottom, the weights F fit loosely round it and are supported by the wire E which passes over the stud D, where a spring presses against it, the strength of which is so adjusted that it is unable to displace the wire as long as the strain of the weights is upon it, but so soon as this is relieved by their resting on the bottom the wire is thrust off the stud, and when the line is hauled in the weights and wire are left behind

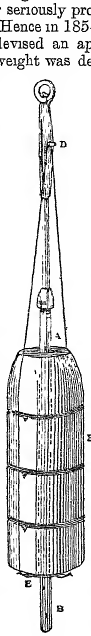

Fig 1

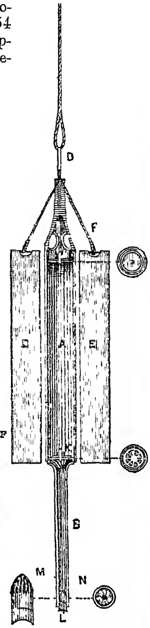

Fig 2

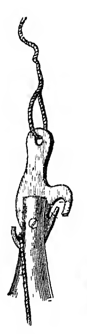

Fig 3

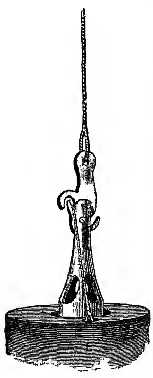

Fig 4

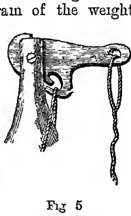

Fig 5

An improved apparatus has recently been invented by Mr J Y Buchanan, and used by him on board the telegraph ships "Dacia" and "Buccaneer," which can be used either in shallow or deep water, and has the advantage of bringing up samples both of the water and of the mud from the bottom It consists of a hollow cylinder A, fig 2, at the top and bottom of which are india-rubber valves H, K, opening upwards, so that water passes freely through them during the descent but is retained as soon as a plug of mud occupies the tube B The weight EE which surrounds the cylinder is supported by a wire F passing over a peculiar hook D, shown separately in figs 3, 4, 5, when sounding in shallow water it is not necessary to detach the weight, and the wire is therefore placed as in fig 3, when working at greater depths the wire rests on the other side of the hook, as in fig 4,—the result being that on the bottom being reached it falls into the upper part of the notch, fig 5, and continues to press the tube into the mud, but when hauling up commences the wire slips out altogether and the weight is left at the bottom A valve L, M, N is sometimes used to retain the sample of the bottom.

At the present time deep-sea sounding is extensively practised for telegraphic purposes, and is almost entirely conducted by means of wire instead of rope, a method introduced by Sir William Thomson The friction of the wire in passing through the water is of course very much less than that of rope, and hence it runs out and can be hauled in much more rapidly, a smaller sinker may be used, and in very many instances it can be recovered It is customary in sounding for cables to make very frequent observations (once in from 1 to 50 miles), for it is found that the laying can be accomplished with much less risk of accident if the contour of the ocean-bed be accurately known The saving of time by the use of wire is very considerable, but the advantage is not so obvious in running out as in hauling in, because a heavier weight is used to increase the rate, this of course involving a loss of iron sinkers For instance, an apparatus similar to that mentioned above as being used by the "Challenger" took on an average 24 m 22 s to sink 2000 fathoms, whilst in a recent sounding by the "Albatross" the weight ran out 2000 fathoms in 20 m 30 s and was hauled in in 21 m 9 s,—a rate which would have been quite unattainable by the aid of rope The saving in the matter of sinkers is by no means inconsiderable, instead of 3 or 4 cwts, only 50 to 60 lb are used, and Sigsbee has calculated that this difference is sufficient to pay for any extra loss there may be by the breaking of the wire Captain Magnaghi of the Italian navy and Captains Sigsbee and Belknap of the American Survey have successfully developed the method of sounding with wire, and owing to its use the last-mentioned officer was able to survey the route from San Francisco to Japan, doing all his sounding by hand, which would have been quite impossible had hempen rope been used When soundings are made for scientific purposes it is customary to ascertain the temperature, both at the bottom and at intermediate depths, by a thermometer of special construction

For further information, see Sir Wyville Thomson, *The Depths of the Sea* (London, 1874), *Narrative of the Cruise of H M S "Challenger"* (London, 1885), Sigsbee, *Deep Sea Sounding and Dredging* (Washington, 1880), Wille, *Norwegian North Atlantic Expedition*, pt ix, "Apparatus and how used," 1876-78, Mill, *The Scottish Marine Station* (Edinburgh, 1885), and, for an improved apparatus used on board the "Talisman," *La Nature*, xii p 120, 1884, also the annual *Reports* of the U S Fish Commission (W E HO)

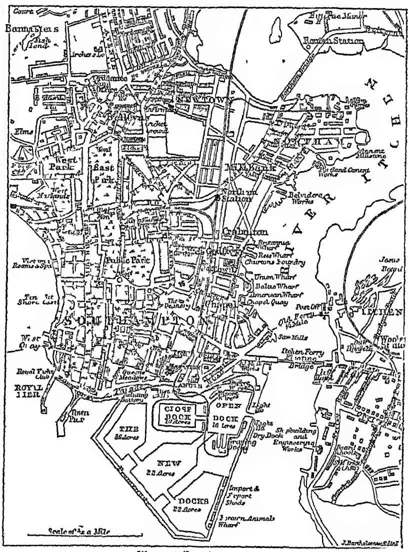
SOUTH, Robert (1633–1716), one of the wittiest of English divines, was the son of a London merchant, and was born at Hackney, Middlesex, in 1633 He was educated at Westminster school, whence in 1651 he was elected to Christ Church, Oxford He became B A in 1654, and the same year wrote several Latin verses to congratulate Cromwell on concluding peace with the Dutch, which were published in a collection of university poems The following year he published a Latin poem, entitled *Musica Incantans* After commencing M A in 1657 he was in the habit before obtaining orders in 1658 of preaching as the champion of Calvinism against Socinianism and Arminianism He was also at this time a strong supporter of Presbyterianism, but on the approach of the Restoration his views on church government under-

went a change. In fact he adhered successively to the triumphant party as represented by Cromwell, Charles, James, and William, and there are substantial grounds for the assertion of Anthony Wood that he was much indebted for his preferments to his zeal for "the powers that be." On 10th August 1660 he was chosen public orator of the university, and in 1661 domestic chaplain to Lord Clarendon. In March 1663 he was made prebend of Westminster, and shortly afterwards he received from his university the degree of D.D. In 1667 he became chaplain to the duke of York. He was a zealous advocate of the doctrine of passive obedience, and also strongly opposed the Toleration Act, declaiming in unmeasured terms against the various nonconformist sects. In 1676 he was appointed chaplain to Lawrence Hyde (afterwards earl of Rochester), ambassador-extraordinary to the king of Poland, and of his visit he sent an interesting account to Dr Edward Pocock in a letter, dated Dantzic, 16th December 1677, which was printed along with South's *Posthumous Works* in 1717. In 1678 he was promoted by the chapter of Westminster to the rectory of Islip, Oxfordshire. Owing, it is said, to a personal grudge, South in 1693 published *Animadversions on Dr Sherlock's Book, entitled a Vindication of the Holy and Ever Blessed Trinity*, in which the views of Sherlock were attacked with much sarcastic bitterness. Sherlock, in answer, published a *Defence* in 1694, to which South replied in *Tritheism Charged upon Dr Sherlock's New Notion of the Trinity, and the Charge Made Good*. The controversy was carried by the rival parties into the pulpit, and occasioned such keen feeling that the king interposed to stop it. During the greater part of the reign of Anne South remained comparatively quiet, but in 1710 he showed himself a keen opponent of Sacheverell. He died 8th July 1716, and was buried in Westminster Abbey.

The style of South is vigorous, pungent, and brilliant, though tending to exuberance. His sermons are strongly practical, but his theory of life is not ascetic. His wit generally inclines towards sarcasm, and it was probably the knowledge of his quarrelsome temperament that prevented his promotion to a bishopric. If he sacrificed principle to his desire for preferment, his ambition was not of a sordid kind, for he was noted for the extent of his charities. He published a large number of single sermons, and they appeared in a collected form in 1692 in six volumes, reaching a second edition in his lifetime in 1715. His *Opera Posthuma Latina*, including his will, his Latin poems, and his orations while public orator, with memoirs of his life, appeared in 1717. His *Works* were published with a memoir by the Clarendon press in 1823, and have been several times reprinted. The contemporary notice of South by Wood in his *Athenæ* is characterized by a strongly hostile tone, partly to be explained by a criticism of South at Wood's expense.

SOUTH AFRICAN REPUBLIC. See TRANSVAAL.

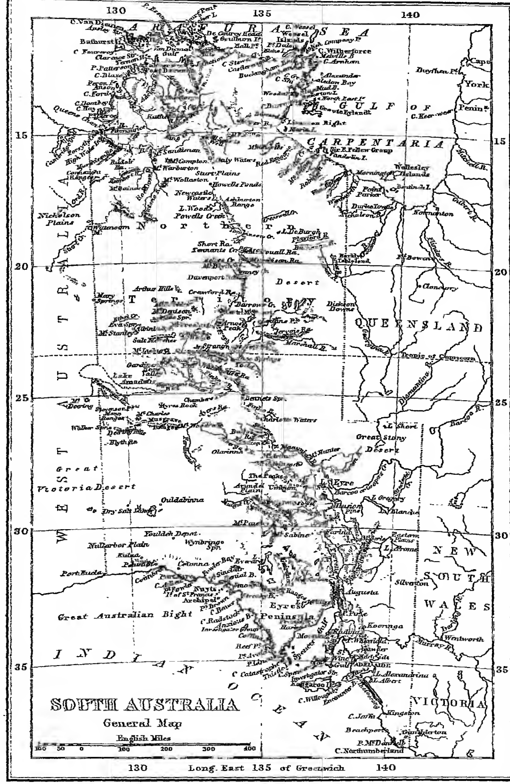
SOUTHAMPTON, a municipal and parliamentary borough, which gives name to Hampshire, or the county of Southampton, and one of the principal seaports on the south coast of England, is beautifully situated at the head of Southampton Water, forming the mouth of the Test, on a sloping peninsula, bounded on the east by the Itchen, at the terminus of the South-Western Railway, 79 miles south-west of London, 13 south-south-west of Winchester, and 24 west-north-west of Portsmouth. Southampton is also a county of itself,—the county of the town of Southampton. It preserves much of its antique appearance, but, although in the older parts the streets if picturesque are narrow and irregular, it may still claim the distinction it enjoyed in Leland's time of ranking "as one of the fairest that is in England," handsome and spacious shops lining the principal streets, while the suburbs are studded with numerous villas and mansions embosomed in woods. There are still considerable remains of the old town walls built in the time of Richard II., the most remarkable being a portion of the west walls, with an arcade on its exterior face. Four of the seven gates are comparatively well preserved—North or Bar Gate, South Castle Gate, Westgate, and Blue Anchor Gate. The finest of these is Bargate, in a room above which is the ancient Guildhall, where the quarter sessions are held. The representations of Sir Bevis of Hampton and the giant Ascupart which formerly stood on each side have recently been obliterated. The castle, originally a Saxon fortress, and rebuilt when the walls were erected, was partly demolished in 1650. After its rebuilding had been begun by the marquis of Lansdowne in 1805, it was sold, and in 1818 the site was parcelled out for building plots. In the vicinity of the castle there are some houses of very ancient date, including King's House (Early Norman). The two old churches, St Michael's (originally Norman about the date of 1080) and Holyrood, have been in a great degree modernized; the former contains a beautiful Byzantine font and a monument to Sir R. Lyster, chief-justice in the 16th century. The French chapel of St Julien, originally attached to the hospital of God's House, founded by Henry VIII. for eight poor persons, is of Norman architecture; it contains the burial-place of the



Plan of Southampton.

earl of Cambridge, Lord Scrope, and Sir Thomas Grey, who in 1415 were executed outside the Bargate for conspiring against Henry V. Among the modern public buildings are the Watts memorial hall, erected in 1876 at a cost of £8000, the municipal office, occupying the old audit-house, the custom-house, the philharmonic hall, the assembly rooms, the county court-house, the corn exchange and chamber of commerce, and two theatres. The educational institutions include the Hartley Institution, founded by bequest for the advancement of natural history, astronomy, antiquities, and classical and Oriental literature, and now embracing a library, reading-room, museum, art gallery, laboratories, and schools of science and art associated with South Kensington; the Edward VI. grammar school,

SOUTH AUSTRALIA



founded in 1550, and reorganized in 1875, and Alderman Taunton's school, founded in 1752, and lately remodelled The school board was established in 1871 The benevolent and charitable institutions are numerous, embracing the dispensary (1809), the royal South Hants infirmary (1838), the female orphan asylum, the homœopathic dispensary (1873), St Mary's cottage hospital (1873), and the Palk memorial home (1876) To the north of the town is Southampton Common, formerly part of the manor of Shirley, and adjoining the town to the north of Above Bar Street is the Public Park, prettily laid out and containing statues of Lord Palmerston, Dr Watts, and Mayor Andrews The town is supplied with water partly from artesian wells and partly from reservoirs The population of the municipal borough (area 2004 acres) in 1871 was 53,741, and in 1881 it was 60,051 In 1885 the area of the parliamentary borough, formerly coextensive with that of the municipal borough, was extended to include the parish of Millbrook, the ecclesiastical district of the Holy Saviour, Bitterne, the parish of St Mary Extra, and the detached portion of Hound included within St Mary Extra The population of this area in 1881 was 84,384 It is represented by two members

The importance of the port dates from the Norman Conquest, and was originally due to its relation to Winchester It had a considerable trade in wine as early as 1152, and from Queen Mary it obtained a monopoly in the importation of sweet wines from the Grecian islands With Venice and Italy it had a large trade as early as the 14th century, and in the subsequent century it had a connexion with Newfoundland, while its Channel trade and its shipbuilding were also of importance About the end of the 16th century its trade had, however, begun to decline, and the visitation of the plague in 1665 tended still further to aid its retrogression Some improvement took place in its prospects by the creation of a Pier and Harbour Commission in 1803, and the erection of the Royal Victoria pier in 1831 was a further step towards prosperity, but its modern trade really dates from the opening up of railway communication with London in 1840 It possesses one of the finest natural harbours and has the advantage of a double tide, a second high tide occurring two hours after the first While largely dependent for its import trade on its connexion with London and its easy communication with France, it has become an outlet for the manufactures of the midland and northern towns Its great tidal dock, completed in 1842 at a cost of £140,000, has an area of 16 acres with a depth of 18 feet at low water, and the inner dock, completed in 1851, an area of 10 acres and a depth of 28 feet Two other docks embracing an area of 50 acres are being constructed There are also four dry docks, capable of receiving vessels of the largest tonnage at all tides Within recent years the port has lost the overland trade between London and India by the removal to London of the headquarters of the Peninsular and Oriental Steam Navigation Company At present it is the headquarters of the Royal Mail Steam Packet Company for the West Indies and the Pacific (*via* Panama) and for Brazil and the River Plate, the Union Line for the Cape of Good Hope, Natal, and East Africa, and the London and South Western Railway Company's steamers to the French coast Steamers also sail regularly for Ireland and various ports on the west coast of England, and the steamers of the North German Lloyd Company touch at the port on the way to and from New York, and also to and from Asiatic and Australian ports The total number of vessels that entered the port in 1876 was 7840 of 1,201,301 tons, of which 3780 with a tonnage of 201,434 were sailing vessels, and 4060 with a tonnage of 999,867 were steamers The number that cleared in the same year was 8047 of 1,174,365 tons, of which 3994 (196,064 tons) were sailing vessels, and 4053 (978,301 tons) were steamers In 1885 the number of vessels that entered the port was 9768 of 1,539,357 tons, of which 3456 (175,900 tons) were sailing vessels, and 6312 (1,363,457 tons) were steamers The number that cleared in the same year was 9641 of 1,523,759 tons, of which 3350 (182,688 tons) were sailing vessels, and 6291 (1,341,071 tons) were steamers Since 1845 the trade has increased more than tenfold, although within recent years the port has suffered from the prevailing dulness The total value of imports and exports in 1845 was £1,475,000, in 1880 the value of the imports was £9,205,183 and in 1884 it was £7,514,354, for these last years the value of the exports of United Kingdom produce was £9,306,326 and £6,909,072, while the value of the exports of foreign and colonial produce and manufactures in 1882 was £1,589,652 and in 1884 £1,150,954 Among the principal imports are cocoa, coffee, corn (including maize), apples, provisions (especially butter, eggs, and potatoes from France and the Channel Isles), rum and brandy, sugar, wine, wool, and rags Among the principal exports of the produce of the United Kingdom are apparel, cotton goods, leather, linen goods, machinery, copper and iron goods, woollen and worsted goods The number of ships built at the port in 1885 was 19, of 17,875 tons burden

The Roman station of Clausentum was situated at Bitterne on the opposite side of the Itchen, where extensive Roman remains have been found The present town was founded by the West Saxons, probably soon after their landing under Cerdic and Cynric on the shores of Southampton Water in 495 The name Hantun-scire (Hamptonshire) occurs in the *Saxon Chronicle* under date 755, and Hamtun is first mentioned separately in 837 The prefix "South" was probably added after the annexation of Wessex to Mercia in 920, to distinguish it from the Hampton in Mercia afterwards called Northampton The town was frequently ravaged by the Danes in the 9th and 10th centuries Canute, after his establishment on the throne, made it his occasional residence, and Southampton beach is reputed to have been the scene of his rebuke to the flattery of his courtiers, by the demonstration of his powerlessness to control the waves Southampton is mentioned in Domesday as Hantune It possessed a mint as early as 925 It was frequently visited by successive monarchs from the time of Henry I In 1338 it repulsed an attack of the French and Genoese In 1415 it was the rendezvous of the army of Henry V for France, and during his stay in the town he detected the conspiracy against him of the earl of Cambridge, Lord Scrope, and Sir Thomas Grey, who were executed outside the Bargate In 1512 the marquis of Dorset embarked from the port with 10,000 men to the aid of Ferdinand of Spain against France, and in 1522 the earl of Surrey set out from it with a large fleet to escort Charles V Queen Elizabeth held a court at Southampton in 1569 On account of the outbreak of the plague in London in 1625 the council was transferred by the king to Southampton, where on the 7th September a treaty was signed with the United Provinces The town received its first charter from Henry II, and a charter of incorporation from Henry VI in 1445 under the style of "mayor, bailiff, and burgesses" This charter was somewhat modified by that granted by Charles I which remained the governing charter till the passing of the Municipal Act The corporation act as the urban sanitary authority The town first returned members to parliament in 1295 Among eminent persons connected with Southampton are Dibdin the song writer, Bishop Peacocke, Thomas Fuller, and Dr Watts

See *History of Southampton*, by J Sylvester Davies, 1883

SOUTH AUSTRALIA, which lies between 129° and 141° E long, has New South Wales and Victoria on the E, Western Australia on the W, and the Southern Ocean on the S Originally its northern line was 26° S lat, but by the addition of the Northern Territory, or Alexandra Land, the area has been extended from 380,070 square miles to 903,690, and the northern border carried to the Indian Ocean The length is therefore from lat 38° S to 11° S, nearly 2000 miles Being much more northern and less southern than the neighbouring colony, its present designation is incorrect in point of fact Plate IV

The southern coast-line shows two large gulfs, Spencer and St Vincent,—the first 180 miles long, the other 100 Spencer Gulf is open to the ocean, while St Vincent Gulf is partly shielded by Kangaroo Island, with Investigator Straits as its westerly entrance and Backstairs Passage for an easterly one Yorke Peninsula separates the two gulfs. Port Lincoln and Sleaford Bay are at the south-west of Spencer Gulf On the western side of Eyria Peninsula—the land westward of Spencer Gulf—are the following bays —Coffin, Anxious, Venus, Streaky, Denial, and Fowler The junction of South and Western Australia is on the Australian Bight Encounter Bay is on the Victorian side, with Lacepede, Guichen, Rivoli, and Macdonnell Bays to the south-east Flinders, Investigator, and Nuyt Islands are south-west Cape Jervis is at the eastern entrance of St Vincent Gulf, Spencer at the western. In Northern Territory are Melville, Adam, Arnhem, and Raffles Bays, Van Diemen's Gulf, Port Essington, and Port Darwin (lat 12° S) The Gulf of Carpentaria divides the territory from Cape York Peninsula of Queensland Melville, Bathurst, and Groote-Eylandt are northern islands The ranges of hills are few, rarely reaching 3000 feet One chain runs north from Cape Jervis. Flinders range has Brown and Arden, 3000 feet Lofty,

near Adelaide, is 2330 feet. Volcanic cones, as Gambier and Schanck, are south-east, near Victoria. In general the country is level, where not slightly undulating. It is far from being well watered, especially to the westward and in the interior. The Murray, passing through Lake Victoria, had previously received most of the drainage of the three eastern colonies. The Torrens flows by Adelaide. Few streams reach the ocean. Cooper's Creek drains part of Western Queensland. The Indian seas receive the Alligator, Liverpool, Roper, Macarthur, Daly and Victoria rivers. Albert and the Coorong are lakes at the Murray mouth. The depressed area northward contains Lakes Torrens, Eyre, Gairdner, Blanche, Hope, and Amadeus. The overland telegraph to Port Darwin passes mostly through an ill-watered country, with oases around springs. The population, 330,000, is principally within 100 miles of Adelaide, the capital, in lat. 35° S. The leading places north of Adelaide are Gawler, 25 miles, Barossa 38, Kapunda 49, Angaston 51, Port Wakefield 60, Clare 90, Kooringa of Burra Burra 100, Moonta 100 north-west, Kadina 96 north-west, Blyth 100, Morgan or North-West Bend 105, Broughton 150, St Petersburg 154, Port Pirie 155 north-west, Port Augusta 240 north-west, Colton 320, Blinman 350. To the east are Barker 21, Echunga 23, Nairne 25, Kingston or Port Caroline 170 south-east, Narracoorte 220, Penola 250, Gambier 290, Macdonnell 304. Lincoln is 210 west. Adelaide Port is 7, Glenelg 7, Brighton 10, Willunga 30 south, Goolwa, the Murray port, is 60 south. Palmerston of Port Darwin is the chief town of Northern Territory, Southport is 25 miles south of it. Other settlements are inland mining townships. There are 36 counties, 4 pastoral districts, 23 municipalities, and 112 district councils in South Australia proper.

Climate.—Excepting Western Australia, this is the driest portion of the island continent. The rain clouds from the Pacific or the Indian Ocean have little store left on reaching the South Australian districts. The north-west summer monsoons favour the northern coast-lands, though the rains penetrate but few miles inland. The trade-winds bring only dry blasts from the Queensland side. A large proportion of the south-western shore has a very partial deposition, and even the southern Yorke Peninsula, laved by two great gulfs, seldom shows any surface water. The conflict between the polar and equatorial currents occasionally throws down rain in the interior, though many a thunderstorm fails to let fall more than a few drops. But the south-eastern coast catches a fair amount of rain from the western breezes off the Southern Ocean. The settled districts have winter rains, when Adelaide plains are transformed from parched sterility to luxuriant vegetation. The average annual rainfall there is but 20 inches, with an evaporation of three times that amount. In 1885 (a dry year) Adelaide had only 16 inches. In some years only 5 inches have fallen, even on parts of the sea shore. The interior, however, has been known to have extensive floods after sudden storms. The northern coast, as at Port Darwin, has from 50 to 70 inches, though for several months without a shower. The heat is considerable during the dry summer time, though cold is felt severely on winter mornings and nights, even in the tropics, when a dozen degrees of frost may be followed in a few hours by a temperature of 80° or 90°.

The health conditions of the colony are but little inferior, except in Adelaide and Port Darwin, to those ruling in Tasmania and New Zealand, which are so much cooler and wetter. Dry heat is never so prejudicial as a moist heat. A raging hot wind from the north and north-west, to which Adelaide is so unpleasantly exposed, is trying to young children, though it never brings noxious gases. On the contrary, when passing over eucalyptus forests it brings down health-giving airs, in spite of 160° in the sun, or even 120° in the shade. Diarrhœa may trouble in summer, and catarrh in winter, but, with a birth-rate of 39 in the thousand and a death-rate of from 12 to 17, South Australia stands more favourably than England in relation to health. Recently, several townships had for the year but seven deaths in the thousand, exhibiting a freedom from mortality three times greater than London. The death-rate of the colony during 1885 was only 12.48 to the thousand, while the birth-rate was 37.70. One-third of the deaths were in Adelaide. Reports from the tropical Northern Territory speak of fever and ague, especially among imprudent gold-miners.

Geology.—The few mountain ranges scattered throughout the colony were once, in all probability, but islands rising in a mediterranean sea that connected the Indian Ocean and Java Sea with the Southern Ocean. Over at least the southern half of South Australian territory the water flowed in Tertiary times. The climatic effect of such an archipelago of islands must have been very different from what now is realized in that region. The rise of the country displayed that vast extent of arenaceous limestone forming the southern coast floor, and extending westward hundreds of miles in Western Australia, and far eastward in Victoria. The south coast is still rising. The Murray cuts its channel through this vast coralline formation. According to the Rev. J. Tenison Woods, the newer Pliocene is near Adelaide, while the older is at Mount Gambier. The Murray cliffs are Upper Miocene, and the Murray flats are Lower Miocene. He finds little or none of Eocene. Flint bands occur in this limestone, particularly at Gambier. The Biscuit country, south-east, has flat limestone concretionary cakes on the surface, more or less rounded. Beds of sand cover large areas of the recent rock. Caves abound in the Gambier district, provided with stalactites and stalagmites. Subterranean rivers flow through some of the caverns, and are occasionally reached by natural sloping wells. Gambier exhibits much Bryozoan limestone. Its 40 species and 16 genera of *Polyzoa* are in Lower Crag. The coral limestone there has extensive flint bands. *Foraminifera* are of many kinds, some of the Rhizopods are still existing in Australian waters. Sharks' teeth and large nautili are frequently met with. Most fossils are in casts, except *Pecten*, *Bryozoa*, *Echini*, &c. The Murray cliffs mark the remains of an extensive formation, since largely denuded. The Gambier deposits prove the presence of an ancient deep sea, when little of Australia, as we now perceive it, had any existence. The South Australian ranges are generally of Primary order, the Silurian formation being often pierced or flooded by igneous rocks, which have transmuted the strata. While granites and granitoids are in great masses, the basalts and greenstones of a later age are not wanting in the ranges. The Primary rocks are observed, also, in Eyre Peninsula, Port Lincoln, the central continental districts, and very prominently in the Northern Territory. Flat-topped sandstone hills prevail northward. Westward and south eastward the Tertiary rests on a granite floor. Eastward there is the same Primary presence, with crystalline mountains developing silver mines just over the border. Metamorphic rocks, rising amidst Tertiary beds, are strong in Yorke Peninsula, producing much copper. The tablelands are of horizontal sandstone, often on spiriferous limestone. Desert sandstone may be Miocene. Near the Victorian boundary, in the south-east corner of South Australia, recent volcanic action is apparent. Several of the lakes there were once craters. The deep Blue Lake, or Devil's Inkstand, occupies the centre of Mount Gambier. The banks are nearly 300 feet high, and are formed of lavas and volcanic ashes. Cinder walls are detected, and other varieties of volcanic products. Several smaller cones surround the great mount. The country itself is of the usual Tertiary limestone, more or less covered with ashes. Mount Schanck, between Gambier and the sea, is known as the Devil's Punchbowl. This cone of lava has an empty crater 200 feet deep. Gambier and Schanck are landmarks to passing mariners. Among the fossil forms in Tertiary Pliocene strata are those of the huge *Diprotodon*, a marsupial vegetable feeder 16 feet in height, with gigantic kangaroos, emus, wombats, &c.

Minerals.—South Australia, though without coal, was the first Australian colony to have a metallic mine, and the first to possess a gold mine. In 1841 the wheel of a dray, going over a hill near Adelaide, disclosed to view silver-lead ore. In the midst of the bad times in 1843 the Kapunda copper mine was found. In 1845 the wonderful Burra Burra copper was first wrought. The land, 10,000 acres, cost £10,000, and for several years the dividends to shareholders were 800 per cent per annum. The first colonial mineral export was 30 tons of lead ore, value £128, in

1843 The copper declined as prices fell It was £322,983 in 1885, when rates were £50 a ton, but £762,386 ten years before with over £90 In 1886 most of the mines were closed Between 250 and 400 miles north of Adelaide a very rich copper district exists Lead is very abundant Manganese, nickel, bismuth, antimony, and silver have been mined Tin is seen in granitic places Iron occurs in almost all formations and in all conditions There is abundance of hæmatite, micaceous, bog, and other ores rich in the metal Taliskei and other mines paid in silver The wonderful Silverton, of Barrier Ranges, in a desert, is just outside the boundary, though 300 miles only from Adelaide while 600 from Sydney Gold was got from a quartz vein at the Victoria mine, near Adelaide, as early as 1846, but did not pay the company Partial gold working has been conducted at Echunga, &c , in southern hills There are rich alluvial and quartz gold mines in Northern Territory, at from 100 to 150 miles south of Port Darwin For the year 1884 the yield was £77,935 Of 1349 miners 1205 were Chinese Gold is now worked at Waukaringa, 225 miles north of Adelaide Copper, tin, and silver are found in Northern Territory Among other minerals asbestos, roofing slates, and fine marbles may be named Some forty years ago precious stones, especially garnets and sapphires, were gathered in the Barossa Hills Carbonaceous material is found at the Coorong, &c , yielding 50 per cent of oil Lake Eyre has a rude coal Kapunda marble quarry is a success In 1885 there were 16,493 acres leased for minerals The value of minerals exported in 1885 was £338,132

Agriculture —This is essentially an agricultural colony In its first establishment, farming was intended as the main occupation The land was cut up for sale into eighty acre lots with the view of settling the people on arrival, and concentrating them, instead of having them scattered as in the neighbouring colonies, in which pastoral pursuits completely dwarfed the farming industry This wise provision made the colony for years the supplier of breadstuffs to Sydney, Melbourne, Brisbane, Perth, and Auckland As neighbours became wheat-producers, Adelaide merchants had to seek markets in Natal, Mauritius, the Cape, or even Europe At all times the state has lent every assistance to agriculture As the colony suffers more from drought than anything else, public reservoirs are constructed and artesian wells are sunk Forest culture has especially attracted Government attention Reforesting and the establishment of nurseries for the trees, fruits, and vegetables of other lands go hand in hand Forest reserves already amount to 150,000 acres Hundreds of thousands of trees are annually planted

The land system, sound at the beginning, has been repeatedly amended, especially with a view to the advancement of pastoral interests Instead of cash sales, as formerly, conditional purchases may be made, extending over a long period, subject to conditions of residence and cultivation At the end of 1884 only ten million acres had been purchased There were, however, 53,000,000 acres enclosed, chiefly for pasturage, and 2,785,490 under cultivation The crop for March 1885 was as follows —wheat, 1,942,653 acres, fallow, 450,536, hay, 308,429, artificial grasses, 23,217, barley, 15,697, lucerne, 8649, oats, 7264, orchard, 5825, potatoes, 5666, pease, 4601, vineyard, 4590 The culture indicates a warm and dry climate, different from New Zealand or the tropical coast of Queensland The product of South Australian fields is so much smaller per acre than in any of the neighbouring colonies that only an open level country of cheap land, with effective machinery at moderate cost, could be managed at a profit Going northward from Adelaide the country becomes too dry for roots, and then too precarious even for wheat The county of Adelaide is very favourably placed for vineyards, oliveyards, and orchards About half the olive trees and a third of the almond trees are there Of 3,704,107 grape vines in the colony, Adelaide county had 2,158,468, and Light, in the neighbouring hills, had 860,356 There were in 1884 473,535 gallons of wine made The commissioners lately reported that the light white wines kept sound and good, while full-bodied red wines continue to improve with age The Water Conservation Department is of great service to agriculture Tropical cultivation receives some attention already in Northern Territory The Chinese raise rice crops, there being heavy rains near the coast Daly river has excellent soil and climate for sugar and coffee

The pastoral progress has been considerable, notwithstanding want of moisture In 1885 there were 1528 leases over 214,916 square miles, besides 257 annual leases with 11,214 square miles There were then 168,420 horses, 389,726 cattle, 163,807 pigs, 6,696,406 sheep (twenty sheep per head of population) Of these the settled counties had 151,058 horses, 179,206 cattle, and 4,995,394 sheep In Northern Territory, with 136,000 cattle, there were in December 1885 6000 horses and 40,000 sheep, that country, excepting in the dry interior, being unfitted for wool-bearers The total export of wool grown in South Australia had only the value of £1,671,775 in 1885 The prices obtained were a fourth less than ten years before The rabbit pest is felt as seriously in pastoral as in agricultural operations Kangaroos are far less troublesome to stockholders than in Queensland Where water can be procured by dams, reservoirs, or wells stock can be kept, since, where the grass fails, cotton bush and various saline plants supply sufficient food An artesian well lately was sunk 1220 feet Wool is remarkably fine there While a South Australia merino has 2720 serrations to an inch of wool, a Leicester sheep has but 1850

Fauna —South Australia is not separated from the neighbouring colonies by any natural boundaries, hence the fauna includes many animals which are also to be found in the land lying to the east and west The northern half of the colony lies within the tropics, and possesses a tropical fauna, which is, however, practically identical with that of northern Queensland In spite of its immense extent north and south, and a corresponding diversity in climate, the colony is poorer in animal life than its neighbours It possesses thirty five genera of mammals These include both genera of the order *Monotremata*,—the *Echidna*, or spiny ant-eater, and the *Ornithorhynchus*, or duck-billed platypus, both of which are found also in eastern Australia and Tasmania The other order of *Mammalia* associated with Australia, the *Marsupialia*, is well represented in South Australia It contains seven genera of *Macropodidæ* or kangaroos, including the wallaby and kangaroo rat, four genera of *Phalangistidæ*, or opossums, and five species of *Dasyuridæ*, or "native cats" Two genera of this family are peculiar to the region—the *Chætocercus* and the *Antichinomys*, the latter is found in the interior It is a mouse like animal with large ears, and is remarkable for the elongation of its fore-arm and hind-foot and for the complete absence of the hallux The *Phascolomys*, or wombat, one of the largest of the marsupials, is also found in South Australia, and the curious *Myrmecobius*, or ant-eater of Western Australia This remarkable animal is about the size of a squirrel, it possesses fifty-two teeth (a greater number than any known quadruped), and, unlike the other members of its order, the female has no pouch, the young hanging from nipples concealed amongst the hair of her abdomen The *Chæropus*, with peculiarly slender limbs and a pouch opening backwards, is found in the interior The remaining *Mammalia* consist of the dingo, or native dog, and a few species of *Muridæ*, the mouse family, and *Cheiroptera*, or bats There are about 700 species of birds, including 60 species of parrots Of the 9 families peculiar to the Australian region, 5 are well represented, including the *Meliphagidæ* (honey-suckers), *Cacatuidæ* (cockatoos), *Platycercidæ* (broad-tailed and grass parroquets), *Megapodidæ* (mound makers[1]) and *Casuaridæ* (cassowaries) The last-named family is represented by the *Dromæus*, or emu, which is hunted in some parts of the colony Reptiles are fairly represented there are fifteen species of poisonous snakes The lizards are very peculiar, South and Western Australia contain twelve peculiar genera No tailed *Amphibia* exist in the continent, but frogs and toads are plentiful

Flora —The plant species resemble those of the eastern colonies and Western Australia, but are more limited in variety The colony, from its dryness, lacks a number known elsewhere Enormous areas are almost destitute of forests or of timber trees The *Eucalyptus* family, so valuable for timber and gum as well as for sanitary reasons, are fairly represented Acacias are abundant, the bark of some being an article of commerce Flinders range has much of the valuable sugar-gum, *Eucalyptus Corynocalyx*, which is being now preserved in forest reserves Its timber is very hard and strong, not warping, resisting damp and ants The head flowered stringybark, *Euc capitellata*, has a persistent bark A sort of stringybark, *Euc tetrodonta*, is found in Northern Territory The gouty-stem tree (*Adansonia*) or monkey-bread of the north is a sort of baobab About 500 northern plants are Indian The *Tamarindus indica* occurs in Arnhem Land, with native rice, rattans, and wild nutmeg The cedar is of the Indian variety Pines are numerous in the south, palms in the north, among the most beautiful is the *Kentia acuminata* Banksias are very common in sandy districts Flowering shrubs are common in the south There are 130 known grasses in Northern Territory

Fisheries —Whaling was formerly an important industry about Encounter Bay, as sealing was in Kangaroo Island The whales have migrated, and the seals are exterminated On the northern side trepang or bêche-de-mer fishery has commenced, and pearl fisheries have been established Of fish within colonial waters there are forty-two peculiar genera The tropical north has similar fish to those of North Queensland, while those of southern bays resemble many of the species of Victoria, Tasmania, and New South Wales There are the barracouta, bonito, bream, carp, catfish, rock cod and Murray cod, conger, crayfish, cuttle, dogfish, eel, flatfish, flathead, flounder, flying-fish, gadfish, grayling, gurnard, hake, John Dory, ray, salmon (so-called), schnapper, seahorse, shark, sole, squid, swordfish, whiting, &c Though called by English names, the fish do not always correspond to those in Europe The Murray cod is a noble freshwater fish

Commerce —There is little speculative trade, the shipping being employed in the conveyance of the exports of the colony and the introduction of needful supplies The imports during 1884 amounted to £5,749,353, of which £2,988,296 came from the United

[1] One genus of this remarkable family—the *Lipoa*—is confined to the district

Kingdom, £997,785 from New South Wales, £714,272 from Victoria, £38,460 from Tasmania, £34,675 from New Zealand, £97,230 from India, £28,011 from Natal, £55,598 from Hongkong, £19,201 from Canada, £239,093 from Mauritius, £54,945 from China, £49,028 from France, £61,727 from Germany, £72,214 from Norway and Sweden, £186,236 from the United States. Of the exports, £6,623,704, there went to the United Kingdom £4,081,864, New South Wales, £773,240, Victoria, £651,019, Queensland, £255,746, Cape Colony, £249,844, India, £144,287, Western Australia, £132,554, Natal, £78,118, France, £57,500, Mauritius, £52,010, Belgium, £33,092. Among the exports during 1884 were wool, £2,616,626, wheat, £1,694,005, flour, £794,812, copper, £469,231, sheepskins, £87,455, silver-lead, £66,592, bark, £45,049, jams, £35,338, horses, £30,845, tallow, £28,403, wine, £17,061, gold, £15,469. There were imported overland 411,307 sheep, and exported 168,770. Of shipping, there entered 1120 vessels of 909,335 tons, and cleared 1111 of 925,197. The British amounts were 768,301 and 783,121 tons respectively. In the Northern Territory the imports were £140,229, exports £90,411, the gold export for the last six months of 1885 was £33,869. The assets of the eleven banks at the close of 1885 were £13,380,716,—total deposits £5,880,950. The Government savings banks, on June 30, 1885, had 53,164 depositors, with £1,571,283 as balances—five per cent interest being allowed.

Manufactures.—Increased attention has been lately directed to local industries, and a more protective tariff has been enforced with a view to their development. The official returns for March 31, 1886, gave 640 works, employing 7952 men and 1350 women.

Communication.—The district councils have charge of many of the roads. The general dryness of the country is favourable to the condition of roads. Railways have been constructed for the conveyance of farming produce to market, the carriage of minerals to port, and the tapping of the Murray river traffic from the east. At the beginning of 1886 there were 1211 miles of railway open, and 570 in course of construction. The working expenses during 1885 came to £386,000, and the revenue to £556,000. There are several tramways, supplementing railway traffic.

Water Supply.—The Government is aiding the railway movement for opening out the interior by the construction of waterworks and public reservoirs. To supply Adelaide, independently of the Torrens river, there has been an expenditure of £866,942. Kapunda has a reservoir of 41,200,000 gallons, Port Pirie of 25,700,000, Mount Barker of 6,000,000, Port Augusta of 666,000, Mount Gambier and Gawler each of 279,000. There are large storage tanks at many places, *e.g.*, for 810,000 gallons at Moonta.

Administration.—The governor is the representative of the crown. The legislative council, of twenty-four members, one third retiring every three years, is chosen by 32,000 electors. The house of assembly, of fifty two members, is appointed for three years by 60,000 electors. Responsible government dates from 1856. The public debt, contracted for useful public works, was £18,000,000 in 1886. For the year 1884-85 the revenue was £2,157,931, but expenditure was £2,430,513. A revision of the tariff was necessary. Customs yielded £511,230, railways, £662,455, against working expenses £411,850, land sales, £333,369, land rents, £132,013, waterworks, £72,366. The expenditure included £311,189 for public works, besides loans, police, £102,784, civil establishments, £73,828, legal, £50,051, charitable institutions, £86,968 (there being no poor law), military defences, £39,473, immigration, £31,129, &c. The Northern Territory gave £71,518 as receipts to the state, but with £85,000 charges. The revenue for 1885-86 was £2,279,039, and the expenditure £2,383,290. No Australasian colony has done so much for the good of the aborigines and the advance of good morals as South Australia. The administration is just and firm, being well sustained by public sentiment.

Education.—Not being so wealthy as its eastern neighbours, the colony has not been able to devote so large an amount to schools, still, a grant of £126,000 was made during 1884-85 towards the instruction of 50,000 pupils. Of 450 schools, half are called public, half provisional for thinly peopled districts. Payment from scholars is not dispensed with as in Victoria. Lands are being set apart as educational grants for the future. All religious denominations are equal in the sight of the law, none receiving any state aid. Bible reading is sanctioned before school hours, and any religious lessons may be given at the close of school time. The Adelaide university, so richly endowed by the colonists, receives an annual grant of £2550 from the local parliament.

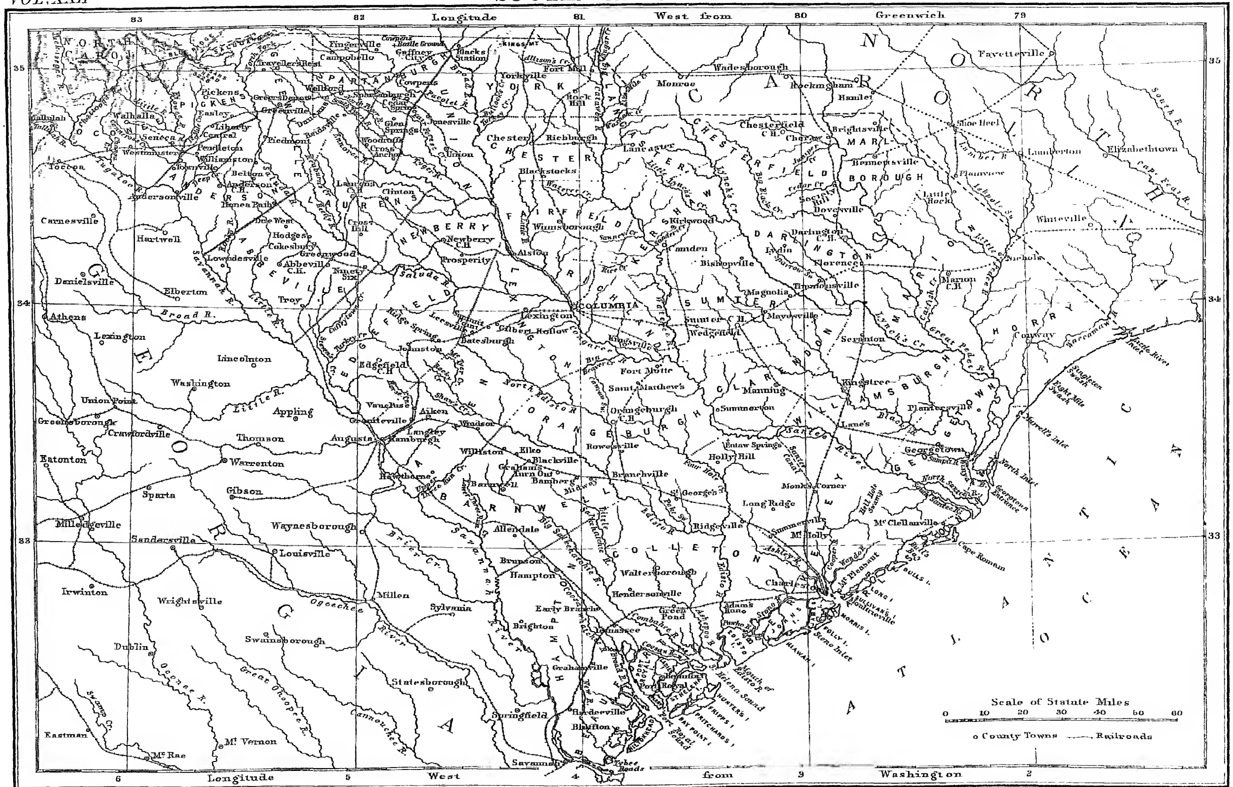
Population.—Including the Northern Territory, the population was returned in 1881 as 279,865 (149,530 males, 130,335 females), in addition to 6346 aborigines (3478 males, 2868 females). The births during 1885 were 12,046, and the deaths 3987 (2205 males and 1782 females). Classed at the last census according to religion, the population may be thus stated:—Church of England, 76,000, Roman Catholic, 42,920, Wesleyans, 42,103, Lutherans, 19,617, Presbyterians, 17,917, Baptists, 14,000, Bible Christians, 10,500, Primitive Methodists, 10,350, Congregationalists, 9908. The population in the Northern Territory, 3500, contains only about a hundred females, but has 3000 Chinamen. More than half the people of South Australia, whether of English or German parentage, are native born. In 1886 the population was 325,000.

History.—Though the coast of Northern Territory was well known to Portuguese and Spanish navigators as early as perhaps 1530, being called Great Java, it was not surveyed till 1644, when Tasman laid down the line of shore pretty accurately. The western part of the southern coast had been seen and named Nuyt's Land in 1627. But Flinders, by his discovery of the two great gulfs, Kangaroo Island, and Encounter Bay, in 1802, was the first to reveal South Australia proper. Captain Sturt descended the Murray in 1830, and looked over the hills near Adelaide. The first to direct attention to a settlement there was Major Baron, who communicated with the colonial office in February 1831. His suggestion was to establish, at no charge to the British Government, a private company, that should settle a party on Yorke Peninsula. He believed a large river entered Spencer Gulf. In August Colonel Torrens and others proposed to purchase land between 132° and 141°—500,000 acres at 5s. an acre. Some were in favour of Spencer Gulf, others of Kangaroo Island, and a few for the mainland towards the Murray. Memorialists in 1832 sought a charter for the South Australian Association, giving extensive powers of self-government. Land sales were to pay the passages of free labour, chiefly young married people, and no convicts were ever to be sent thither. Lord Goderich did not favour the scheme, and thought a colony with free institutions might prejudice the interests of New South Wales, while free trade would interfere with the English navigation laws. After much negotiation, the English authorities regarded the scheme more favourably, but would not consent to give the company the powers they sought. The company receded in their demands, and offered security for the proper observance of law and order, while depositing cash for the purchase of land. Captain Sturt in 1834 informed the colonial secretary that Spencer Gulf and Kangaroo Island were objectionable, but that the eastern side of St Vincent Gulf was the best locality. In 1835 the ministry got an Act passed for the erection of a colony, under commissioners appointed by the crown, who would be responsible for their acts to the British Government. It was arranged that a local government should be established when the settlement had 50,000 people. Mr George Fife Angas advanced a large sum as security to the state. Though the first settlers were sent to Kangaroo Island, all were afterwards gathered on the Adelaide plains. The colony was proclaimed under a gum tree, December 28, 1836. Great delay took place in the survey of land. The South Australian Company purchased large tracts from the commissioners at 12s. per acre and sold at 20s. A general speculative spirit arrested progress. Governor Gawler went into extravagant outlay on public buildings, &c., and drew against orders upon the English treasury. Such difficulties arose that the British rulers had to suspend the charter in 1841 and make South Australia a crown colony. A revival of prosperity took place when the farms were tilled and poverty had taught prudence. Copper and lead mines were subsequently discovered. Kapunda in 1843, and the Burra Burra copper mine in 1845, greatly aided in the restoration of commercial credit. The gold fever in Victoria drew off numbers in 1852, but the good prices then realized for breadstuffs gave a great impetus to farming. It deserves to be mentioned that rarely if ever has a colony been so favoured as South Australia in the character of its early settlers. (J. BO.)

SOUTH BEND, a city of the United States, the county seat of St Joseph county, Indiana, received its name from its position at a great bend of the St Joseph river, which is navigable to this point from its mouth at St Joseph on Lake Michigan. By railway the city is 85 miles east of Chicago. It is a great manufacturing centre, with iron-works, carriage, waggon, plough, and sewing machine factories, flour-mills, paper-mills, &c. The court-house is one of the best buildings in the State, and the Roman Catholic university of Notre Dame, St Mary's academy, and St Joseph's academy are institutions of some importance. The population of the city numbered 1652 in 1850, 7206 in 1870, and 13,280 in 1880.

SOUTH CAROLINA, one of the original thirteen Plate States of the American Union, commonly known as the Palmetto State, from the abundance of this kind of palm on the coast, once formed a part of that vast territory of the New World claimed by the Spaniards under the name of Florida and by the French under that of New France, or, to be more concise, it comprised the southern or lower portion of what was formerly styled Carolina, and subsequently divided into North and South Carolina. It lies

SOUTH CAROLINA



between 32° 4′ 30″ and 35° 12′ N lat and between 78° 25′ and 83° 49′ W long In shape it is an irregular triangle, the vertex resting upon the Blue Ridge Mountains in the extreme north-west, while the Atlantic forms its base It is bounded N and N E by North Carolina, S E by the Atlantic, and S W by the Savannah river, which, with its tributaries the Tugaloo and Chatauga, separates it from Georgia The state is 189 miles long and 160 broad, containing 30,961 square miles or 19,815,040 acres, and is divided into thirty-four counties (formerly districts) At the census of 1880 the population numbered 995,577, of whom 391,105 were white, the rest coloured Very few Indians are to be found The surface may be about equally divided into high, middling, and low land, the last-named rising from the sea-coast, where it is very flat and level, and gradually increasing in elevation towards the interior, where it attains a mean of 250 feet, continuing to the north line, where, after varying from 300 to 800 feet it reaches its highest elevation of 1000 feet The land along and near the coast is low, marshy, and swampy, especially on the rivers' banks, rolling and diversified towards the centre, and undulating near the mountain slope, but in places abrupt, King's Mountain rising almost perpendicularly 500 feet The chief elevations in this section are the Saluda Mountains, spurs of the Blue Ridge, King's Mountain (1692 feet), Paris Mountain (2054 feet), Table Rock (3000 feet), Cæsar's Head (3118 feet), and Mount Pinnacle (3436 feet) This region abounds in beautiful and picturesque scenery, rendering it attractive to tourists, and making it a great summer resort

The land is irrigated and well-drained by numerous rivers, the largest of which is the Santee, formed by the Saluda, Congaree, Catawba, and Wateree, uniting at the centre of the State The other rivers of any size are the Waccamaw, Lynch's, Great and Little Peedee, forming the Peedee, Black, Wando, Ashley, Cooper, Edisto, Combahee, Ashepoo, Coosaw, Port Royal, and Broad (on the coast), this last being more of a bay The sea-coast is fringed by numerous islands, and indented by bays and inlets,—Winyaw and Bull's Bays, Charleston Harbour, Stono Inlet, North and South Edisto Inlets, St Helena Sound, and Port Royal,—the last one of the finest harbours in the world, as its name, said to have been given on this account by the early discoverers and explorers, would imply The entire coast south of Winyaw is composed of a network of creeks and sounds, so that, for small craft, navigation inland may be had from this point to the mouth of the Savannah on the extreme south-west Most of the rivers rising in the mountains are navigable nearly to the foot-slope Here numerous rapids and waterfalls afford excellent mill-power Canals throughout the State are not numerous, the few formerly in use having been abandoned in favour of the railroads The Santee Canal, connecting that river with the headwaters of the Cooper, 22 miles in length, has given place to the North-Eastern Railway

The climate of South Carolina is mild and genial, snow falling in the mountains but rarely in the middle sections, and seldom or never along the coast The sea islands generally, as well as the pine barrens, are healthy, furnishing the planter with a summer home and safe retreat from the malaria of the rice lands These regions were formerly innocuous to the whites, as they still are to the negroes, but subsequent clearance and cultivation have rendered them fatal in summer The midlands are considered healthy in all parts except here and there along the creeks, while the mountain region is unexceptionable

The coast of South Carolina, like places in the same latitude, is subject to violent storms, tornadoes, and cyclones, which make their annual visits on or about the autumnal equinox, doing much damage Till quite recently the district has never been seriously troubled with earthquakes Slight tremors have indeed been felt and recorded since 1754, without, however, causing serious injury But on the night of the 31st August 1886 Charleston was visited by an earthquake which was followed by other shocks and tremors, which continued night and day at intervals with greater or less violence, as the following list shows —

August 27	1 shock, slight	Sept 8	1 shock, slight
August 28	1 shock, slight	Sept 10	1 shock, slight
August 31	5 shocks, destructive	Sept 12	1 shock, slight
Sept 1	3 shocks, severe	Sept 15	2 shocks, moderate
Sept 2	3 shocks, severe	Sept 21	1 shock, severe
Sept 3	2 shocks, severe	Sept 22	1 shock, moderate, local
Sept 4	2 shocks, slight	Sept 27	1 shock, severe
Sept 5	1 shock, moderate	Sept 28	1 shock, moderate
Sept 7	2 shocks, slight	Sept 30	1 shock, slight

The main shock was very destructive to property, while about forty lives were lost, and many more were injured Crevices several yards in length and varying from one to four inches in width appeared, and in some places in the suburbs of the city fissures of much larger proportions threw up water to the height of several feet There was no warning given except that in the small town of Summerville, about 22 miles to the north, considerable disturbance was caused by thuds and tremors with detonations on the 27th and 28th, felt on the latter date to some extent in Charleston The violence of these shocks was confined almost exclusively to this State, though they were felt in a slighter degree in Georgia and North Carolina

Vegetation The soil in the low country is remarkably fertile, the river swamps and reclaimed marshes being admirably adapted to the cultivation of rice, while the sandy loam of the sea islands and surrounding main produces the finest long staple, black seed, or sea island cotton of silky fibre As we recede from the salt the staple becomes shorter and the plant has a less luxuriant growth The rice produced here, noted abroad as Carolina rice, is considered first in the markets of the world The State was the first to introduce rice culture in America, the seed having been brought in 1693 by a vessel from Madagascar Abundant crops are raised of wheat, rye, maize, oats, barley, buckwheat, pease, beans, sugar, tobacco, indigo, sorghum, broom-corn, sunflower, guinea-corn, sweet and Irish potatoes, hemp, flax, and hops Numerous orchards, all over the State, furnish quantities of apples, pears, quinces, plums, peaches, nectarines, apricots, cherries, and along the coast figs, oranges, lemons, olives, and pomegranates The raspberry, blackberry, mulberry, and whortleberry are produced The strawberry is extensively cultivated along the coast, and shipped in immense quantities to the northern markets Of nuts, the walnut, pecan, chestnut, hickory, shell bark, hazel nut, and chinquapin may be mentioned The grape grows wild in many portions of the State, and in great varieties, which, when cultivated, yield a delicious wine In certain sections hundreds of acres are devoted to the culture The gardens and farms produce in abundance turnips, beets, parsnips, carrots, artichokes, mustard, benne, rhubarb, arrowroot, water and musk melons, cucumbers, cabbages, kale, lettuce, cayenne pepper, squashes, okra, pumpkins, onions, leeks, beans, radishes, celery, green pease, and tomatoes,—the last two from early spring to mid-winter The jasmine, Cherokee rose or nondescript, wild honeysuckle, and sweet brier perfume the woods, the dog-wood and fringe tree abound in the forest, and garden flowers in the cities, especially Charleston, Columbia, and Beaufort, are the admiration of strangers Conspicuous among these are the *Camellia japonica* of all varieties and shades, azalea in every hue, roses of numberless descriptions, hyacinth, snowdrop, violet, dahlia, tulip, verbena, sweet olive, and heliotrope Valuable and almost inexhaustible forests extend over the greater part of the State, the long leaf or yellow pine, confined chiefly to the low country, covering 10,000,000 acres, and furnishing immense quantities of timber, tar, pitch, turpentine, and rosin Here and elsewhere are found the magnolia, sweet and black gum, white, water, red, and live oak, black walnut, elm, hickory, maple, sycamore, ash, cypress, chestnut, beech, locust, persimmon, dogwood, poplar The palmetto is peculiar to the coast

Animals The forests abound in deer, wild turkeys, foxes, wild cats, raccoons, opossums, rabbits, and squirrels, and along the water courses are found the musk otter, &c Among the birds are pigeons, doves, partridges, woodcock, snipe, immense flocks of wild ducks, including the English or canvas back, teal, blackhead, &c Freshwater fish of every variety are taken in all the streams in the interior, and the bays and inlets furnish whiting, mackerel, bass, flounder, sheephead, shad, mullet, blackfish, sturgeon, terrapin, turtle, shrimps, crabs, and oysters Quantities of salmon and carp have been furnished by the fish commissioners for stocking the waters

Minerals. Minerals are liberally diffused over the State Gold is found in Lancaster, York, Union, Spartanburg, Greenville, Pickens, and Abbeville counties, copper in York, Spartanburg, and Pickens, lead in the last, iron of a superior quality in Union, Spartanburg, Greenville, and Pickens, manganese in Lancaster, York, Chester,

Union, Spartanburg, Greenville, Pickens, Anderson, Abbeville, and Edgefield; bismuth in Chesterfield and Lancaster; plumbago in Spartanburg; soapstone in Fairfield, Chester, York, Spartanburg, Laurens, Greenville, Pickens, Abbeville, and Edgefield; coal in Chesterfield and Marlboro. Limestone abounds in nearly all the upper counties, but chiefly in Laurens and Spartanburg. The finest blue and grey granite is found in the middle and upper sections; sandstone, burrstone, and flagstone in Edgefield, Pickens, York, and Fairfield. Pottery and porcelain clay, quartz, and sand for glass exist in many places. Tuomey states that "the aluminous formations that occur in immense beds of the finest porcelain clay are often exposed by the denuding effects of water and lie in rich strata upon the very surface, ready to the hand of the manufacturer. Between Aiken and Graniteville the beds are in many cases 60 feet thick, while those in the Savannah river near Hamburg are from 10 to 15 feet and of unsurpassed purity." The Aiken council committee report in this vicinity immense beds of different kinds of clay, from the purest and whitest kaolin to the dark coloured mud of which bricks are made, sands of all hues, some as fine as flour, others with large coarse crystals, siliceous earths of many kinds, ferruginous sandstones, conglomerate shell, burrstone, mica, feldspar, and ochres of different colours. But a short distance off a deposit of magnesia is found, and potash can readily be made in the surrounding forests. Experts have pronounced the sands to be admirably adapted for making glass and crystal, and the quality of the kaolin is admitted to be equal, if not superior, to that of which Staffordshire ware is made. It is doubtful if the combination of the ingredients of glass and earthenware can be found in such immediate proximity anywhere else. Mineral springs exist in several of the upper counties.

Railways. Railroads are on the increase. The South Carolina Railway, between Charleston and Augusta, Ga., was, at the time of its completion, the longest continuous railroad in the world.

Industries. Manufactures are growing in importance, chief among them are cotton yarn and cloth, flour, lumber, turpentine, and fertilizers. The capacity of twenty nine mills now in operation is estimated at 14,821,166 lb of yarn, 79,442,327 yards of cloth, and the value of product $9,097,464. In 1880 there were 82,324 spindles and 1676 looms, in 1884 195,112 spindles and 3652 looms. The number of lumber mills at work is 729, employing 5894 hands and a capital of $2,920,870. The value of their annual production is $5,592,565. Of turpentine stills there are 291, with 6991 hands and a capital of $1,454,800, with an annual production to the value of $2,912,271. These figures show an increase of 100 per cent in less than four years. The fertilizers are valued at $3,346,400, and the miscellaneous manufactures at $2,114,680. The whole value of manufactured products was in 1860 $8,615,195, in 1870, $9,858,981, in 1880, $16,738,008, in 1884, $32,324,404. South Carolina phosphates are of recent date, but their importance may be shown by stating that they pay yearly, by direct taxation, an amount for royalty which is 20 per cent of the whole income of the State. The value of this rock was first pointed out by Mr Jonathan Lucas, a planter, who afterwards materially assisted in developing its usefulness. The first company, the Charleston South Carolina Mining and Manufacturing Company, was formed in 1867. There are now fourteen land and eleven river mining companies with capital ranging from $10,000 to $200,000. In addition to these there are a number of individuals who are licensed by the State to mine in the navigable streams, employing an estimated capital of about $50,000. The total amount of phosphate rock mined and shipped in 1868–70 was 20,000 tons, in 1871, 50,000 tons, in 1875, 115,000 tons, in 1880, 190,000 tons, and in 1883, 355,000 tons,—the total since 1868 being 2,290,000 tons. Of this amount 1,078,070 tons were river and 1,211,830 land rock. The capital invested in the former is $525,000, and 649 hands are employed (wages $259,300), with an annual production of $907,170; in the latter the corresponding figures are—capital $1,980,000, hands 1286, wages $363,560, production $1,283,830.

The six gold mining counties report eleven mines in operation, employing 600 hands, with a capital of $140,000 and an annual production of $90,000. The same counties report eighteen gold mines or gold bearing areas not now worked; one of the mines has a capital of $40,000. Ten counties report quarries or kaolin beds worked and unworked, there are twenty-five granite quarries, five kaolin beds, and one soapstone quarry. There are also in the State large unworked deposits of mica, pyrites, corundum, and marl, with some silver. The quarries and kaolin works, with a capital of $96,350, have an annual production of $220,000.

The upland cotton crop of 1883 was 468,227 bales of 400 lb. The corn area was 1,359,593 acres, and the production 10,876,744 bushels. 321,958 acres in oats yielded a crop of 4,187,082 bushels. Of wheat (182,215 acres) the yield was 1,388,731 bushels. The rice crop of 1883–84 was 33,600 tierces. The sea island cotton crop was 9500 bags. This last, as well as the small grain and subsidiary crops, has suffered a decline in the last few years of 25 to 35 per cent.

The proportions of white and coloured labour in the State are about 30 per cent and 70 per cent respectively. The rate of wages paid is from $8 to $9 a month for men and $6 for women, with board. About 23 per cent of white women and children work on the farms, and about 61 per cent of the coloured. The systems used are—the contract, in which services rendered are paid by giving the labourer the use of the land and house, or where the wages are paid monthly, or a portion monthly and the remainder at the end of the year; and the tenant system, in which the labourer rents the land, and from the crop pays the landlord the rent and for the use of the animals. Land varies in price from 50 cents for pine barren to $100 for choice farming land.

Live stock. Horses and mules are raised at very little cost. Ordinary scrub cattle are seldom housed, roaming the forests at will, except when herded for branding or for driving to market. Sheep thrive away from the salt, and are profitable in the mountains. Hogs, not improved breeds, like cattle, have the liberty of the woods, and are taken with dogs when needed. According to estimates of improved stock, there are 792 Jerseys, 177 Ayrshires, 50 Devons, 33 Holsteins, 1 Guernsey, besides a number of Shorthorns and Brahmins. Merino, South Down, Oxford Down, and Broad-Tail sheep are raised in many parts of the State, with Essex and Berkshire hogs.

Education. Free schools trace their origin as far back as 1710. A system of free schools was inaugurated in 1811. The present public school system was established in 1868. It provides free instruction to pupils of both races, in primary and intermediate grades. Their management is under the direction of the State board of examiners, consisting of the State superintendent of education, and four other persons appointed by the governor. In each county the school commissioner is elected by the people for two years. The schools are supported entirely by taxation. There are 3562 public schools in the State. The number of persons in the State between the ages of six and sixteen is 281,664, of whom 51,440 are white males, 49,749 white females, 90,897 coloured males, 89,578 coloured females. The number of pupils enrolled is 178,023 (41,819 white males, 36,639 females, 48,418 coloured males, 51,147 females). The number of male white teachers employed is 1137, females 1205, coloured males 982, females 449,—making a total of 3773. There are 3562 public schoolhouses, valued at $405,097.31. Institutions for higher education, supported by the State, are the South Carolina College and South Carolina Military Academy for white males, and the Claflin College for coloured persons of both sexes. There is an institution for the education of the deaf, dumb, and blind. There are, besides, numerous private schools and colleges.

Religion. Churches of all denominations multiplied in the State during the colonial period, and subsequently Episcopalians, Presbyterians, Independents, Baptists, and French Protestants established congregations in Charleston just after 1680. Methodists and Romanists came a century later, Jews in 1756, German Lutherans in 1759. The coloured people are for the most part Methodists, some being Baptists and Presbyterians, a few Episcopalians.

Cities. CHARLESTON (*q.v.*) is the largest city of the State. COLUMBIA (*q.v.*), the capital, has (1886) a population of 20,000, while that of Charleston is 60,000. Greenville, in the north-west portion of the State, is a growing railway centre and manufacturing city, with a population of 10,000. Georgetown and Beaufort on the coast do a good shipping business in lumber and other exports. Spartanburg and Aiken are important places, the former as a railway centre, the latter as a health resort for invalid strangers in winter, when the population is more than doubled. Other towns are Newberry, Orangeburg, Florence, Camden, Sumter, Graniteville, Chester, Anderson, Abbeville, Winnsboro, Yorkville, Union, Cheraw, Walhalla, Piedmont, Port Royal, Marion, Darlington, Lancaster.

Government. The executive department consists of a governor, lieutenant-governor, who is *ex officio* president of the senate, comptroller general, treasurer, secretary of state, attorney general, and a superintendent of education; these are elected by the people, to serve two years. The legislative department embraces a senate and a house of representatives, which together are called the general assembly. The former is composed of thirty seven members, elected for four years, one from each county, except Charleston, which sends two. The house of representatives consists of 124 members, elected for two years. The judicial department consists of a supreme court and of circuit, probate, and justices' courts. The supreme and circuit court judges are elected by the general assembly,—the former for six years, the latter for four. The probate judges for each county are elected by the people, and the justices of the peace are appointed by the governor.

History. The first attempt to settle Carolina was in 1562, when Admiral Coligny obtained from Charles IX. of France permission to plant a colony of Protestants on the coast of Florida. An expedition was fitted out at the expense of the crown, and placed under the command of Jean Ribault. Fear of the Spaniards perhaps induced them to change their plans, and, entering Port Royal, they landed on Lemon Island, where they erected a pillar, and afterwards a fort, which they named, in honour of the king, Aix Carolina. Leaving a sufficient number to garrison the fort, Ribault returned to France. Two years later a second expedition under Laudonnière,

one of Ribault's men, was fitted out, but on landing at Port Royal it found no traces of the former This colony likewise met with disaster, being massacred by the Spaniards from Florida It was not until a century later that a permanent settlement was made by the English, who, after the Restoration, began to recognize their claim to a large territory in the southern district of North America In 1662 a grant was obtained from Charles II, and in 1667 an expedition sailed under command of Capt William Sayle They reached Port Royal, where they made a settlement, but a few years after removed to the west bank of the Ashley, and built a town which they called, after the English monarch, Charlestown Subsequently they again removed to Oyster Point, the present site of Charleston (W SI)

SOUTHCOTT, JOANNA (1750–1814), was born in Devonshire about 1750, and was for a considerable time a domestic servant She was originally an adherent of the Methodists, but, becoming persuaded she possessed supernatural gifts, she wrote and dictated prophecies in rhyme, and announced herself as the woman spoken of in the Apocalypse (ch xii), affirming, when beyond the age of sixty, that she would be delivered of Shiloh on the 19th October 1814 For some days previous to this she was attended by her followers night and day, but Shiloh failed to appear, and it was given out that she was in a trance She died of dropsy on the 29th of the same month Her followers are said to have numbered over 100,000, and so late as 1860 they were not extinct

Among her publications, which number over sixty, and are all equally incoherent in thought and grammar, may be mentioned *Strange Effects of Faith*, 1801–2, *Free Exposition of the Bible*, 1804, *The Book of Wonders*, 1813–14, and *Prophecies announcing the Birth of the Prince of Peace*, 1814 A lady named Essam left large sums of money for printing and publishing the *Sacred Writings of Joanna Southcott* The will was disputed by a niece on the ground that the writings were blasphemous, but the Court of Chancery sustained it

See Roberts, *Observations on the Divine Mission of Joanna Southcott*, 1807, Reece, *Correct Statement of the Circumstances attending the Death of Joanna Southcott*, 1815

SOUTHEND, a watering-place of Essex, is situated on the north bank of the Thames, 5 miles west of Shoeburyness, and by the London, Tilbury, and Southend Railway, 42 miles east of London, with which it is also connected by steamer It first sprang into notice from a visit of Queen Caroline in 1804, and, as it is the nearest watering-place to London, it is much frequented by excursionists, especially by the poorer classes It is clean and well built, and at Cliff Town there are a number of large villas Opposite Cliff Town there is a public garden called the Shrubbery The bathing is good, but the tide recedes with great rapidity and for nearly a mile The pier, which is $1\frac{1}{4}$ miles in length, and on which there is a tramway, permits the approach of steamers at all tides The public hall was erected in 1872 at a cost of £3000, and a mechanics' institution dates from 1881 The Rochford county court is held every alternate month in the public hall A local board of health was established in 1866 The population of the urban sanitary district (area 3441 acres) in 1871 was 4561, and in 1881 it was 7979

SOUTHERNE, THOMAS (1660–1746)—"Honest Tom Southerne," to give the author of *The Fatal Marriage* the name by which his contemporaries usually called him—was a clever craftsman for the stage, according to the degenerate tradition of the Restoration dramatists,—with the eye of a born opportunist for the popular interests of the hour in so far as they could be turned to histrionic account, but without deeper seeing of the functions of the drama Born in Dublin in 1660, he came to London and entered the Middle Temple in 1678, but only to desert law very speedily for dramatic authorship His first play, *The Persian Prince, or the Loyal Brother*, is a good example, in its diplomatic reference to passing events and its veiled compliment to James, duke of York, of his ready tact as a playwright The most important practical result of the play, which was remarkably successful on the stage, was an ensign's commission, noteworthy in that it supplied Southerne with materials for later dramatization After an interval of active service more plays followed, and were produced with equal success, of these *The Fatal Marriage* (1694), known also by the name of its heroine, Isabella, has the best claim to remembrance Its strain of pathetic quality echoes the later Elizabethans in a way that contrasts suggestively with the shallow, if spirited, indecencies of Southerne's comedies, which, although their author was commended by Dryden for his purity as a playwright, are certainly not overweighted with delicacy *Sir Anthony Love, or the Rambling Lady*, in which the hero assumes female disguise without accession of modesty, is a good example of the rest, one utterance of its hero, "Every day a new mistress and a new quarrel," might indeed serve as a good motto of Restoration comedy in general Except to the student, Southerne's work, however, is hardly of permanent interest The Southerne of whom Pope, who ranked him as friend and praised him for his sterling qualities, remarked in some lines that

"Heaven sent down to raise
The price of prologues and of plays"

exemplifies what business tact and dramatic ingenuity can accomplish, for of real artistic faculty he had little His plays resulted, through ingenious management, in a pecuniary return which dazzled Dryden and made their author a wealthy citizen, but they have not the quality of work which endures He died in 1746

SOUTHEY, CAROLINE (1786–1854), the second wife of Robert Southey, was born at Lymington, Hants, on December 6th, 1786 As a girl Caroline Ann Bowles showed a certain literary and artistic aptitude, the more remarkable perhaps from the loneliness of her early life and the morbidly delicate condition of her health,—an aptitude, however of no real distinction When money difficulties came upon her in middle age she determined to turn her talents to account in literature Her first venture was the sending anonymously of a narrative poem called *Ellen Fitzarthur* to Southey, and this led to the acquaintanceship and lifelong friendship which in 1839 culminated in their marriage *Ellen Fitzarthur* (1820) may be taken as typical, in its prosy simplicity, of the rest of its author's work, which reproduced the studied unadornment of certain portions of Southey's and Wordsworth's poetry without that glamour which, especially with the second of these writers, so often redeemed simplicity from mere baldness Mrs Southey's poems were published in a collected edition in 1867 Her prose is on the whole more interesting than her verse, though—with rare exceptions—infected with like dulness Among her prose writings may be mentioned *Chapters on Churchyards* (1829), her best work, *Tales of the Moors* (1828), and *Selwyn in Search of a Daughter* (1835) Her most interesting memorial is her correspondence with Southey, which, somewhat unfairly overlooked in the edition of the poet's *Life and Letters* edited by his son, has been published by Prof Dowden in the Dublin University Press Series It was soon after her marriage that her husband's mental state became hopeless, and from this time till his death in 1843, and indeed till her own, her life was one of much suffering Mrs Southey died at Buckland Cottage, Lymington, on July 20th 1854, two years after the queen had granted her an annual pension of £200

Besides the works already mentioned, she wrote *The Widow's Tale, and other Poems*, 1822, *Solitary Hours* (prose and verse), 1826, *Tales of the Factories*, 1833, *The Birthday*, 1836, *Robin Hood*, written in conjunction with Southey, at whose death this metrical production was incomplete

SOUTHEY, ROBERT (1774–1843), was born in Bristol on the 12th of August 1774 His father, a native of Somerset, was an unsuccessful draper To his mother,

Margaret Hill, Southey owed his buoyant spirits, his practical sense, and his earliest friends. The first of these, Miss Tyler, his mother's half-sister, took possession of him when he was three; under her care he saw and heard a great deal of theatres and of acting. His solitary life in an old maid's household threw him upon his own resources and developed a taste for reading. He was sent to several private schools, and had good fortune at none of them; in 1788 he went to Westminster, where he was scarcely more fortunate. After a brief sojourn he was expelled in 1792, because an essay of his on flogging, in a school magazine called *The Flagellant*, was resented by Dr Vincent, the head-master. At Westminster he gained the friendship of two boys who were faithful to him and helpful throughout his life; these were Charles Wynn and Grosvenor Bedford. About this time his father died; his aunt, however, determined that he should go to Oxford. He was refused at Christ Church on account of the essay in *The Flagellant*, but Balliol gave him a home. At Oxford he led his own life, lived in his own thoughts, and got little or nothing from the university. In 1794 Coleridge dashed at Southey, took him by storm, and filled his head with plans for an ideal colony in the wilds. The new society, whose members were to have all things in common, was to be called "The Pantisocracy." Their life was to combine manual labour and domestic bliss; to attain the latter, Southey set his affections on a Miss Edith Fricker, whose sister married Coleridge. All this was intolerable to Miss Tyler, and Southey was banished. He and Coleridge then tried, by lecturing and journalism, to raise money for their American schemes; but luckily Southey's uncle, who had educated him,—Mr Hill, the English chaplain at Lisbon,—advised him to travel. On the 14th of November 1795, before he started, he was secretly married to Edith Fricker. On his return from Lisbon the marriage was acknowledged, and Southey wandered from one house to another in the south of England. He tried, or was urged to try, the three professions which are by courtesy styled "learned"; it might be more true to call them the technical, the stereotyped professions. Southey was scared from all three,—from clericalism by dogma, from medicine by the dissecting-room, from law by its crabbed dulness. In literature alone he found his proper sphere; and in 1803 he settled down in his life-long home, Greta Hall, near Keswick. Henceforth his years were even and uneventful. He wrote and read with mechanical, with appalling regularity; his library grew to fourteen thousand volumes. He had children, and lost several; and his house was a refuge for the wife and family of Coleridge. With Wordsworth and Landor he formed close friendships. In 1813 he was made poet-laureate; and some years before his death he was offered a baronetcy—which, however, he with good reason declined. Two great sorrows embittered his life: in 1809 he lost his eldest boy Herbert, and in 1834 his wife was taken to a madhouse, whence she came back to die. In 1839 he married Caroline Bowles. That same year his memory failed, his speech became uncertain, and his power of writing soon went; softening of the brain had taken irremediable hold of the once tireless intellect. To the last he would hover round his books and handle them lovingly. He died on the 21st of March 1843; he is buried, near his first wife and her children, in Crosthwaite churchyard.

The amount of Southey's work in literature is enormous. His collected verse, with its explanatory notes, fills ten volumes; his prose occupies about forty. But his greatest works were left uncompleted, and this, in some sense, is typical of Southey's whole achievement in the world of letters; there is always something unsatisfying, disappointing, about him. He seldom realized or seldom found scope for his true bent in literature. This is most true of his efforts in verse. In his childhood Southey fell in with Tasso, Tasso led him to Ariosto, and Ariosto to Spenser. These beautiful, these luxuriantly imaginative poets captivated the boy, and Southey mistook his youthful enthusiasm for an abiding, a life-long inspiration. His inspiration was not genuinely imaginative; he had too large an infusion of prosaic commonplace in his nature to be a true follower of Ariosto and Spenser. Southey, quite early in life, resolved to write a series of epics on the chief religions of the world. The subject was dangerous, and one epic is a life's work; it is not surprising that the too ambitious poet failed. His failure is twofold: he was wanting in artistic power and in poetic sympathy. With regard to the first, he says of himself, "It was long before I acquired this power,"—the power of plan and construction,—"not fairly, indeed, till I was about five or six and thirty." The fact is, he never acquired it, he never could construct a dramatic plot or mould it into artistic details. When his epics are not wildly impossible they are incurably dull; at the best their interest is extrinsic rather than intrinsic, pervaded by the glamour of historic romance rather than the light of pure poetry. And a man is not fit to write epics on the religions of the world when he can say of the prophet who has satisfied the gravest races of mankind,—Mohammed was "far more remarkable for audacious profligacy than for any intellectual endowments." Southey's age was bounded, and had little sympathy for anything beyond itself and its own narrow interests; it was violently Tory, narrowly Protestant, defiantly English. And in his verse Southey truthfully reflects the feeling of his age. This led him to say dreadful things about the Eastern religions in his prefaces to *Kehama* and *Thalaba*; it made *Joan of Arc* an incongruous blending of Rousseau, of Horace Walpole's romanticism, of the Surrey theatre, and of Lady Huntingdon; it gave Madoc, a Celt of the 12th century, the mind of a cold middle class Saxon evangelical of the regency. In the shorter pieces Southey's commonplace asserts itself, and if that does not meet us we find his bondage to his generation. This bondage is quite abject in *The Vision of Judgment*; Southey's heavenly personages are British Philistines from Old Sarum, magnified but not transformed, engaged in endless placid adoration of an infinite George III. When Southey sets himself to fondle the regent, he loses all sense of measure and propriety. In the *Funeral Ode* to the Princess he can assert of her father—

> "Such the proud, the virtuous story,
> Such the great, the endless glory
> Of her father's splendid reign!"

This famous ode, "with the grace and beauty of which," Sir Henry Taylor thinks, "no facts could compete," is, it must be said, in many of its couplets, too like the average hymn. The twang of the hymn spoils two of Southey's best pieces. *The Holly Tree* ends—

> "That in my age as cheerful I might be
> As the green winter of the holly tree."

The last lines of *Stanzas Written in his Library*, a poem dear to the book-lover, are painfully like a rhyme on a tomb-stone:—

> "Yet leaving here a name, I trust,
> That will not perish in the dust."

Some of his subjects, *The Poet's Pilgrimage*, for instance, he would have treated delightfully in prose; others, like the *Botany Bay Eclogues*, *Songs to American Indians*, *The Pig*, *The Dancing Bear*, should never have been written. *The Retrospect*, of which this is a fair specimen,—

> "There where my little hands were wont to rear
> With pride the earliest salad of the year,"—

a living critic and biographer of Southey has compared to *The Deserted Village*. Southey was not in the highest sense of the word a poet; but if we turn from his verse to his prose we are in a different world; there Southey is a master in his art, who works at ease with grace and skill. "Southey's prose is perfect," said Byron; and, if we do not stretch the "perfect," or take it to mean the supreme perfection of the very greatest masters of style, Byron was right. For good prose, plain, unassuming, natural, he is not surpassed in English. In his charming story of *The Three Bears* a phrase is often used which exactly describes his style; when the old lady finds what is neither too hot nor too cold, too large nor too small, she says it is "just right." Southey's prose is "just right,"—it expresses his meaning with simple and admirable precision. In his prose and in his criticism we of a later generation could do worse than learn from Southey; his sober writing is an excellent corrective for our prevailing faults. In prose the real Southey emerges from his conventionality. His interest and his curiosity are unbounded, as his *Common-Place Book* will prove; his stores of learning are at his readers' service, as in *The Doctor*; his patriotism is vigorous and healthy, as in the *Life of Nelson*; his criticism is sound, as in the *Lives* of Cowper and of Wesley. But the truest Southey is in his *Letters*: the loyal, gallant, tender-hearted, faithful man that he was is revealed in them. Southey's fame will not rest, as he supposed, on his verse; all his faults are in that,—all his own weakness, and all the false taste of his age. But his prose assures him a high place in English literature, though not a place in the first rank even of prose writers.

SOUTHPORT, a municipal borough of Lancashire, England, and a favourite seaside resort, is situated between the estuaries of the Mersey and the Ribble, 18 miles north of Liverpool, and is a terminal station of three railway systems. Its foreshore consists of a great expanse of firm, bright sands, to the radiation of heat from which is attributed the mildness of its winter climate. Its proximity to Liverpool, Manchester, and other large manufacturing towns has drawn to it a large resident population, and its visitors, in quest of health and pleasure, number many thousands annually. Its spacious streets, laid out at right angles to each other, are bordered with trees and ornamental gardens. The promenade along the shore is two miles in length, in its centre is the pier, a mile long, down which tramcars are drawn by a stationary steam-engine. Other facilities for outdoor enjoyment are provided in Hesketh Park (presented to the town by the late Rev. Charles Hesketh, rector of North Meols, and one of the lords of the manor), the Botanic Gardens, Kew Gardens, and the Winter Gardens. The last, laid out at a cost of £130,000, include a large conservatory, a fine enclosed promenade, a theatre, and an aquarium. There is also a glaciarium, or skating and curling hall, in which those amusements may be practised on real ice all the year round. The Victoria baths were erected in 1870 at an expenditure of £50,000. The principal public buildings are the town-hall, the Cambridge hall (used for concerts &c.), and an extensive range of markets, erected in 1881 at a cost of £40,000. Among the benevolent institutions are a general infirmary, a convalescent hospital, a sanatorium for children, and a neuro hydropathic hospital. Southport has also a free library and art gallery (the gift of the late William Atkinson), a literary and philosophical institute, and a college (Trinity Hall) for the education of the daughters of Wesleyan ministers, and the town council are now (1886) engaged in building a museum and schools of science and art. The first house in Southport (an inn for the reception of sea-bathers) was built in 1791, and soon after other houses were erected on the site now known as Lord Street. The population, which in 1809 was 100, had increased in 1851 to 4766, and in 1861 to 10,097. In 1867 the town received a charter of incorporation, and since then its progress has been remarkable. In 1871 the population of the borough (area 7526 acres) was 18,086, in 1881 this had grown to 32,206, and in 1886 it was estimated at 36,596. Its sanitary arrangements are very perfect, and the water supply is abundant and excellent. Southport gives its name to one of the parliamentary divisions of South-West Lancashire.

SOUTHWARK. See LONDON.

SOUVESTRE, ÉMILE (1806–1854), a French novelist of merit, was born on April 15, 1806, and died on July 5, 1854. He was a native of Morlaix, and his affection for Brittany coloured most of his best work in after life. He had rather a chequered career of employment besides his literary pursuits. He was by turns a bookseller's assistant, a private schoolmaster, a journalist, and *professeur* at the grammar schools of Brest and Mulhouse. In 1848 he received what may sound to English ears the odd appointment of "professor of administrative style" in a school founded for the instruction of civil servants. His literary work, however, was his labour of love. He began like most Frenchmen with the drama, but was never very successful with it. In novel-writing he did much better, and with Jules Sandeau (though on a somewhat lower level of writing, construction, and grasp of character) may be said to rank as the chief recent French novelist who deliberately aimed at making the novel an engine of moral instruction. With less genius and less sense of art than Sandeau, he did not always escape the reproach of dulness. His best work is undoubtedly to be found in the charming *Derniers Bretons* (1835–1837) and *Foyer Breton* (1844) (where the folklore and natural features of his native province are worked up into story form, with a success hardly excelled by any other writer), and in *Un Philosophe sous les Toits*, which received the honour of an academic prize in the year 1851. This Souvestre deserved, not merely for his sentiments, but for his easy and agreeable style. He also wrote a not inconsiderable number of other works—novels, dramas, essays, and miscellanies.

SOWERBY, JAMES (1757–1822), was at first a painter, but soon applied his art to the illustration of botanical and conchological works, which are still highly valued, especially his *English Botany* (12 vols 8vo, 1846). His son George (1788–1854) followed in his father's steps, and produced a monumental work on conchology.

SOWERBY BRIDGE, a manufacturing town in the West Riding of Yorkshire, is situated on both sides of the river Calder, at the termination of the Rochdale Canal, and on the Lancashire and Yorkshire Railway, 2 miles south-west of Halifax, and 8 north-west of Huddersfield. Christ church, dating from 1526, was rebuilt in 1819. The other public buildings include the town-hall (1857) and the local board offices, opened in 1878, attached to which are the public baths and the slaughter-houses. The town is almost entirely the growth of the last fifty years. It possesses worsted and cotton mills, iron-works, dye-works, and chemical works. The population of the urban sanitary district (area 536 acres) in 1871 was 7041, and in 1881 it was 8724.

SOZOMEN, church historian. Hermias Salamanes (Salaminius) Sozomenus came of a wealthy family of Palestine, and it is exceedingly probable that he himself was born (not later than 400 A.D.) and brought up there,—in Gaza or the neighbourhood. What he has to tell us of the history of South Palestine was derived from oral tradition. His grandfather, as he himself tells us, lived at Bethel near Gaza, and became a Christian, probably under Constantius, through the influence of Hilarion, who among his other miracles had miraculously healed an acquaintance of the grandfather, one Alaphion. Both men with their families became zealous Christians and conspicuous for their virtues. The historian's grandfather became within his own circle a highly esteemed interpreter of Scripture, and held fast his profession even in the time of Julian. The descendants of the wealthy Alaphion founded churches and convents in the district, and were particularly active in promoting monasticism. Sozomen himself had conversed with one of these, a very old man. He was brought up under monkish influences, so he expressly states, and his history bears him out. As a man he retained the impressions of his youth, and his great work was to be also a monument of his reverence for the monks in general and for the disciples of Hilarion in particular. He became a lawyer and advocate in Constantinople, where as such he wrote his Ἐκκλησιαστικὴ Ἱστορία about the year 440. The nine books of which it is composed begin with Constantine and come down to the death of Honorius (423), but according to his own statement the author intended to continue it as far as the year 439. From Sozomen himself (iv. 17), and statements of his excerptors Nicephorus and Theophanes, it can be made out that the work did actually come down to that year, and that consequently it has reached us only in a somewhat mutilated condition, at least half a book being wanting. A flattering and bombastic dedication to Theodosius II. is prefixed. When compared with the history of SOCRATES (*q.v.*), it is plainly seen to be a plagiarism from that work, and that on a large scale. Some three-fourths of the

materials, essentially in the same arrangement, have simply been appropriated from his predecessor without his being so much as named even once, the other sources to which Sozomen was indebted being, however, expressly cited. All that can be said to the credit of Sozomen is that he has been himself at the trouble to refer to the principal sources used by Socrates (Rufinus, Eusebius, Athanasius, Sabinus, the collections of epistles, Palladius), and has not unfrequently supplemented Socrates from them, and also that he has adduced some new authorities, in particular sources relating to Christianity in Persia, Arian history, monkish histories, the *Vita Martini* of Sulpicius, books of Hilarius; the whole of the ninth book is entirely drawn from Olympiodorus.

It is difficult to discern the motive for a work which was merely an enlarged edition of Socrates. But it is probable that Sozomen did not approve of Socrates's freer attitude towards Greek science, and that he wished to present a picture in which the clergy should be still further glorified, and, above all, monasticism brought into still stronger prominence. In Sozomen everything is a shade more ecclesiastical—but only a shade—than in Socrates. Perhaps also he wrote for a different circle,—say, the monks in Palestine,—and could be sure that in it the work of his predecessor would not be known.

Sozomen is everywhere an inferior Socrates. What in Socrates still betrays some vestiges of historical sense, his moderation, his reserve in questions of dogma, his impartiality,—all this is wanting in Sozomen. In many cases he has repeated the exact words of Socrates, but with him they have passed almost into mere phrases. The inferiority of Sozomen to Socrates as an historian appears as much in the manner in which he transcribed him as in those passages where he introduces something new. The chronological scrupulosity of the earlier writer has made no impression on his follower; he has either wholly omitted or inaccurately repeated the chronological data. He writes more wordily and diffusely. In his characterizations of persons, borrowed from Socrates, he is more dull and colourless. After Socrates he has indeed repeated the caution not to be too rash in discerning the finger of God; but his way of looking at things is throughout mean and rustic. Two souls inhabit his book: one, the better, is borrowed from Socrates; another, the worse, is his own. Wherever he abandons his leader he frequently falls into mere retailing of stories, and prostrates himself in reverence before the poorest products of the religious fantasy of a degenerating age. Evidence of a boundless credulity with regard to all sorts of monkish fables is to be met with everywhere. Raisings of the dead are quite common occurrences with him, and he repeatedly gives accounts of enormous dragons. In the finding of the bones of saints he takes the highest interest, and even believes in the rediscovery of the tombs of the Old Testament prophets.

Where we still possess Socrates's account that of Sozomen very seldom has any consequence, but some of the additions he has made are instructive and important. The number of new acts of councils introduced by him is small. His monkish histories are as sources almost utterly valueless; his account of the Christians in Persia absolutely swarms with mistakes. It must, however, be noted that for the period from Theodosius I. onward he has emancipated himself more fully from Socrates and has followed Olympiodorus in part, partly also oral tradition; here accordingly his statements possess greater value.

Editions and Literature.—Socrates and Sozomen have been edited by Stephanus (Paris, 1544; Geneva, 1612), Valesius (Paris, 1659-73), Reading (Cambridge, 1720), Hussey (Oxford, 1853, 1860). They are also to be found in vol. lxvii. of Migne's *Patrologia*, and there is an Oxford school edition (1844) after Reading. Bright edited Socrates according to the text of Hussey in 1878. There are "Testimonia Veterum" in Valesius, and Nolte's papers in *Tubing. Quartalschr.*, (1859) p. 518 *sq.*, (1861) p. 417 *sq.*, contain emendations in Hussey's text, and notes towards the history of the text and editions; see also Overbeck, in *Theol. Lit. Ztung.* (1879), No. 20.

Special studies have been made by Baronius, Miraeus, Labbé, Valesius, Halloix, Scaliger, Collier, Cave, Dupin, Pagi, Ittig, Tillemont, Walch, Gibbon, Schroeckh, Lardner. See also Voss, *De Histor. Graecis*; Fabricius-Harless, *Biblioth. Gr.*, vol. vii.; Rossler, *Bibliothek d. Kirchenväter*; Holzhausen, *De Fontibus quibus Socr., Soz., ac Theod. in scribenda Historia Sacra usi sunt*, (Göttingen, 1825; Stäudlin, *Gesch. u. Lit. d. K. G.*, Hanover, 1827; Baur, *Epochen* (1825); Harnack, "Socr. u. Soz.," in Herzog-Plitt's *Theol. Encykl.* Detached details are given also in works upon Constantine (Manso), Julian (Mücke, Rode, Neumann, Rendall), Damasus (Rade), Arianism (Gwatkin's *Studies of Arianism*, 1882, gives a severe but trustworthy criticism of Rufinus and discusses the manner in which Socrates was related to him), the emperors after Julian (De Broglie, Richter, Clinton, the *Weltgeschichte* of Ranke, the *Gesch. d. Kaiser Arcadius u. Theod. II.* 1885, of Güldenpenning, and the *Kaiser Theodosius d. Gr.*, Halle, 1878, of Ifland, the last named work discussing the relation of Socrates to Sozomen), the barbarian migrations (Wietersheim, Dahn), the Goths (Waitz, Bessel, Kaufmann, and Scott's *Ulfilas*, 1885). Lastly, reference may be made to Rosenstein, *Forsch. z. deutsch. Gesch.*, vol. i.;—*Krit. Untersuch. üb. d. Verhältniss zu Olympiodor, Zosimus, u. Soz.*, Sarrazin, *De Theodoro Lectore, Theophanis Fonte Praecipuo*, 1881 (treats of the relation between Socrates and Sozomen, and of the completeness of the former's work); Jeep, *Quellenuntersuch. z. d. griech. Kirchenhistorikern*, Leipsic, 1884. (A. HA.)

SPA, a watering-place of Belgium, in the province of Liége, 20 miles by rail from Liége *via* Pepinster, is beautifully situated, at a height of 814 feet above the sea, in the valley of the Wayai (a small sub-tributary of the Meuse). On the north and north-east it is protected by the wooded range of hills known as the Spaloumont, or in its several parts as Bois de la Reid, Bois du Chiencul, &c., and on the south are a number of beautiful ravines cut in the Primary rocks of the district by small affluents of the Wayai. Much of the charm of the place is due to the promenades and drives along the sides and crests of the hills. The principal mineral spring called the Pouhon (a local word for "well") is enclosed in a pump-room in the centre of the Place Pierre le Grand. Public baths, fed by chalybeate streams collected in a remarkable reservoir at the hamlet of Nivesé, occupy a large building in Place Royale, erected in 1868; and in the same neighbourhood is the casino, with ball and concert rooms. An English church was built in 1872-76. A local industry is the production of fancy articles in lacquered wood (bois de Spa). A liqueur resembling Chartreuse is also manufactured under the name of "elixir de Spa." The population of the commune was 6930 in 1884. Several springs in the neighbouring district are nearly as celebrated as those of Spa proper; the Sauvenière waters, supposed to be effective against sterility, are half a mile distant.

Spa, said to derive its name from a Walloon word, *Espa*, for "fountain," was practically founded by a certain Wolf, or Collin le Loup, iron-master of Breda, who had obtained benefit from the waters, and purchased the piece of ground containing the Pouhon spring from Erard de la Marck, bishop of Liége, in 1326. At the beginning of the 15th century the little town numbered 250 houses. The European celebrity of the waters dates from the 16th century, when they were drunk by the duke of Nevers, Margaret of Valois, Henry III. of France, and Alexander Farnese; and the fashion of visiting Spa became thoroughly established in the 18th century. The French Revolution, and, as far as English visitors were concerned, the attractions of the German watering-places made known by Sir Francis Head, for a time turned the tide elsewhere; but since the middle of the century Spa has taken a new lease of prosperity.

SPAGNA, Lo (? -c. 1529), the usual designation (due to his Spanish origin) of Giovanni di Pietro, one of the chief followers of Perugino. Nothing whatever is known of his early life, or of the circumstances under which he became a member of the Perugian school. A large number of panel pictures by him exist, of which some are painted with much grace and refinement of touch. There is, however, a very marked absence of individuality about his style, which seems like an imitation of the earliest manner of Raphael and that of Pinturicchio in a weaker and less virile form. The chief of his numerous panel paintings are the Nativity, in the Vatican, and the Adoration of the Magi, at Berlin. In 1510 Lo Spagna executed many frescos at Todi, and in 1512 several other mural paintings in and near Trevi. His most important works were frescos at Assisi and Spoleto, of which some exist in good preservation. He received the freedom of the city of Spoleto in 1516, as a reward for his work there. As is so often the case, Lo Spagna's frescos reach a much higher standard of merit than his panel pictures. The museum of the Capitol in Rome now possesses a very beautiful series of life-sized fresco figures by him, representing Apollo and the Nine Muses. These are drawn with a strong feeling for grace of pose and beauty of expression, and are very remarkable for the delicate refinement of their colouring; in style they strongly recall Raphael's earliest manner. Lo Spagna was alive in 1528, but he appears to have died before 1530, as in that year a pupil of his named Doni completed a fresco in S. Jacopo, near Spoleto, which Lo Spagna had begun.

SPAGNOLETTO. See RIBERA.

SPAIN

PART I.—GEOGRAPHY AND STATISTICS

Plate VI

SPAIN, a country rather more than twice the size of Great Britain including the adjacent small islands, constitutes in its mainland portion about eleven-thirteenths of the Iberian Peninsula, and has in addition an insular area (in the Balearic and Canary Islands) of nearly 5000 square miles. On all sides except that of Portugal the boundaries are natural, the Peninsula being separated from France by the Pyrenees and on every other side being surrounded by the sea. On the side of Portugal a tract of inhospitable country led originally to the separation between the two kingdoms, inasmuch as it caused the reconquest of the comparatively populous maritime tracts from the Moors to be carried out independently of that of the eastern kingdoms, which were also well peopled. The absence of any such means of intercommunication as navigable rivers afford has favoured the continuance of this isolation. The precise line of this western frontier is formed for a considerable length by portions of the chief rivers or by small tributaries, and on the north (between Portugal and Galicia) it is determined to a large extent by small mountain ranges. The British rock of Gibraltar, in the extreme south of the peninsula, is separated from Spain by a low isthmus known as the Neutral Ground.

Coast-line

The coast-line on the north and north-west is everywhere steep and cliffy. On the north there are numerous small indentations, many of which form more or less convenient harbours, but the current flowing along the coast from the west often leaves in the stiller water at their mouths obstructive bars. The best harbours are to be found on the *rias* or fiord-like indentations in the west of Galicia, where high tides keep the inlets well scoured; here occur the fine natural harbours of Pontevedra and Vigo, Coruña and Ferrol, the last one of the chief stations of the Spanish fleet. Less varied in outline but more varied in character are the Spanish coasts on the south and east. Flat coasts prevail from the frontier of Portugal to the Straits of Gibraltar. Between the mouth of the Rio Tinto and that of the Guadalquivir they are sandy and lined by a series of sand-dunes (the tract known as the Arenas Gordas). Next follows a marshy tract at the mouth of the Guadalquivir, after which the coast line becomes more varied, and includes the fine Bay of Cadiz. From the Straits of Gibraltar a bold and rocky coast is continued almost right round to Cape Palos, a little beyond the fine natural harbour of Cartagena. North of Cape Palos a line of flat coast, beginning with the narrow strip which cuts off the lagoon called the Mar Menor from the Mediterranean, bounds half of the province of Alicante, but in its northern half this province, becoming mountainous, runs out to the lofty headland of Cape Nao. The whole coast of the Bay of Valencia is low and ill-provided with harbours; and along the east of Catalonia stretches of steep and rocky coast alternate with others of an opposite character.

Surface

The surface of Spain is remarkable at once for its striking contrasts and its vast expanses of dreary uniformity. There are mountains rising with Alpine grandeur above the snow-line, but often sheltering rich and magnificent valleys at their base. Naked walls of white limestone tower above dark woods of cork, oak, and olive. In other parts, as in the Basque country, in Galicia, in the Serrania de Cuenca (between the head waters of the Tagus and those of the Jucar), in the Albarracin (between the head waters of the Tagus and those of the Guadalaviar), there are extensive tracts of undulating forest-clad hill country, and almost contiguous to these there are apparently boundless plains, or tracts of level tableland, some almost uninhabitable, and some streaked with canals and richly cultivated—like the Requena of Valencia. While, again, continuous mountain ranges and broad plains and tablelands give the prevailing character to the scenery, there are here and there, on the one hand, lofty isolated peaks, landmarks for a wide distance round, such as Monseny, Monserrat, and Mont Sant in Catalonia, the Peña Golosa in Valencia, Moncayo on the borders of Aragon and Old Castile, and, on the other hand, small secluded valleys, such as those of Vich and Olot among the Catalonian Pyrenees.

Central tableland

The greater part of the interior of Spain is composed of a tableland bounded by the Cantabrian Mountains in the north and the Sierra Morena in the south, and divided into two by a series of mountain ranges stretching on the whole from east to west. The northern half of the tableland, made up of the provinces of Leon and Old Castile, has an average elevation estimated at about 2700 feet, while the southern half, made up of Estremadura and New Castile, is slightly lower—about 2600 feet. On all sides the tableland as a whole is remarkably isolated, and hence the passes on its boundary and the river valleys that lead up to it from the surrounding plains are geographical features of peculiar importance. The isolation on the side of Portugal, where the tableland gradually sinks to the sea in a succession of terraces, has already been referred to. On the north-west the valley of the Sil and a series of valleys further south, along both of which military roads have been carried from an early period, open up communication between Leon and the hill country of Galicia, which explains why this province was united to Leon even before the conquest of Portugal from the Moors. The passes across the Cantabrian Mountains in the north are tolerably numerous, and four of them are already crossed by railways. The two most remarkable are the Pass of Pájares, across which winds the railway from Leon to Oviedo and the seaport of Gijon, and that of Reinosa leading down to the deep valley of the Besaya, and now crossed by the railway from Valladolid to Santander. In its eastern section the chain is crossed by the railways from Burgos to Bilbao and San Sebastian, the latter of which winds through the wild and romantic gorge of Pancorbo (in the north east of the province of Burgos) before it traverses the Cantabrian chain at Idiazabal.

On the north-east and east, where the edge of the tableland sweeps round in a wide curve, the surface sinks on the whole in broad terraces to the valley of the Ebro and the Bay of Valencia, and is crowned here and there by more or less isolated mountains, some of which have been already mentioned. On the north-east by far the most important communication with the Ebro valley is formed by the valley of the Jalon, which has thus always formed a military route of the highest consequence, and which is now traversed by the railway from Madrid to Saragossa. Further south the mountains clustered on the east of the tableland (Albarracin, Serrania de Cuenca) render direct communication between Valencia and Madrid extremely difficult, and the principal communications with the east and south-east are effected where the southern tableland of La Mancha merges in the hill country which connects the interior of Spain with the Sierra Nevada.

In the south the descent from the tableland to the

valley of the Guadalquivir is again comparatively gradual, but even here in the eastern half of the Sierra Morena the passes are few, the most important being the Puerto de Despeñaperros, where the Rio Magaña has cut for itself a deep gorge through which the railway now ascends from Andalusia to Madrid. Between Andalusia and Estremadura farther west the communication is freer, the Sierra Morena being there broken up into series of small chains.

Cantabrian Mountains.

Of the mountains belonging to the tableland the most continuous are those of the Cantabrian chain, which stretches for the most part from east to west, parallel to the Bay of Biscay, but ultimately bends round towards the south between Leon and Galicia. Almost everywhere it consists of two parallel ranges, the higher of which, the more southerly, is the immediate continuation of the Pyrenees. The highest summits of the chain belong to the Jura limestones of the Peñas de Europa, on the borders of the provinces of Santander, Oviedo, Leon, and Palencia. The highest of all is the Torre de Cerredo, which attains the height of at least 8750 feet, and next is the Peña Prieta (8300 feet). At the sources of the Sil the main chain divides into two branches, enclosing the fertile and thickly-populated district known as El Vierzo, once the bed of a lake, now watered by the stream just mentioned and its tributaries. The whole chain is remarkable for its intricate ramifications and its wild grandeur, but, as already indicated, is not so much of a barrier to communication as might be expected from its general aspect. Besides the railways above mentioned it is crossed at many points by bridle paths and roads.

A peculiar feature of the chain and the neighbouring parts of the tableland is formed by the *parameras* or isolated plateaus, surrounded by steep rocky mountains, sometimes even by walls of naked rock. Among the larger of these are the bleak districts of Siguenza and Soria, round the headwaters of the Duero,—districts which separate the mountains of the so-called Iberian system on the north-east of the tableland from the eastern portion of the central mountain chains of the peninsula. Of these chains, to which Spanish geographers give the name Carpetano-Vetonica, the most easterly is the Sierra de Guadarrama, the general trend of which is from south-west to north-east. It is the Montes Carpetani of the ancients, and a portion of it (due north of Madrid) still bears the name of Carpetanos. Composed almost entirely of granite, it has an aspect when seen from a distance highly characteristic of the mountains of the Iberian Peninsula in general, presenting the appearance of a saw-like ridge (*sierra*) broken up into numerous sections. Its mean height is about 5250 feet, and near its centre it has three summits (the highest named the Pico de Peñalara) rising to the height of nearly 8000 feet.

Central mountain chains.

A region with a highly irregular surface, filled with hills and parameras, separates this sierra from the Sierra de Gredos farther west. This is the loftiest and grandest sierra in the whole series. Its culminating point, the Plaza de Almanzor, attains the height of 8725 feet, not far short of that of the highest Cantabrian summits. Its general trend is east and west; towards the south it sinks precipitously, and on the north it descends with a somewhat more gentle slope towards the longitudinal valleys of the Tormes and Alberche which separate it from another rugged mountain range, forming the southern boundary of the paramera of Avila. On the west another rough and hilly tract, similar to that which divides it from the Sierra de Guadarrama in the east, separates it from the Sierra de Gata, the westernmost and the lowest of the Spanish sierras belonging to the series. These hilly intervals between the more continuous sierras greatly facilitate the communication between the northern and southern halves of the Spanish tableland. The Guadarrama is indeed crossed by three good pass-roads, and even the Sierra de Gredos has a road across it connecting Avila with Talavera de la Reina by the Puerto del Pico; but for the most part there are only bridle-paths across the sierras, and up to the present date not a single railway crosses any one of the sierras directly. The only railway crossing the central system of mountains is that from Madrid to Avila, which traverses the interval between the Sierras de Gredos and Guadarrama, passing through numerous tunnels on the way. A railway from Madrid to Segovia to cross the latter sierra at the Puerto de Navacerrada (5830 feet),[1] the pass at present crossed by the principal high road across these mountains, is now (1886) in course of construction.

On the southern half of the tableland a shorter series of sierras, consisting of the Montes de Toledo in the east (highest elevation 4600 feet) and the Sierra de Guadalupe in the west (highest elevation 5100 feet), separates the basins of the Tagus and Guadiana. The southern system of mountains bounding the Iberian tableland—the Sierra Morena—is even less of a continuous chain than the two systems last described. As already intimated, its least continuous portion is in the west. In the east and middle portion it is composed of a countless number of irregularly-disposed undulating mountains all nearly equal in height.

Sierra Morena.

Even more important than the mountains bounding or crossing the tableland are those in the north-east and in the south, which are connected with the tableland only at their extremities. The former are the PYRENEES (*q.v.*), the latter are the Sierra Nevada, and the coast ranges still farther south. The Sierra Nevada, or "snowy sierra," is a well-defined chain, between 50 and 60 miles in length, and about 25 miles in breadth, situated to the south of the valley of the Guadalquivir, and stretching from the upper part of the valley of the Jenil in the west to the deep valley of the Almeria in the east. It is composed chiefly of soft micaceous schists, sinking precipitously down on the north, but sloping more gently to the south and south-east. Its culminating summit, the Cerro de Mulahacen (11,660 feet), is the highest in Spain, and the range contains several other peaks upwards of 10,000 feet in height, and above the limit of perpetual snow. On both sides deep transverse valleys (*barrancas*) follow one another in close succession, in many cases with round basin-shaped heads, like the *cirques* of the Pyrenees. In many of these cirques repose alpine lakes, and in one of them, the Corral de Veleta, there is even a small glacier, the most southerly in Europe. On the south the transverse valleys of the Sierra Nevada open into the mountainous longitudinal valley of the Alpujarras, into which open also on the other side the transverse valleys from the most easterly of the coast sierras, the Sierra Contraviesa and the Sierra de Almijara. The latter are continued farther west by the Sierra de Alhama and Sierra de Abdalajiz. Immediately to the west of the latter sierra lies the gorge of the Guadalhorce, which now affords a passage for the railway from Malaga to Cordova; and beyond that gorge, to the west and south-west, the Serrania de Ronda, a mountain group difficult of access, stretches out its sierras in all directions. To Spanish geographers the coast ranges just mentioned are known collectively as the Sierra Penibetica. North-east of the Sierra Nevada two small ranges, Alcaraz and La Sagra, rise with remarkable abruptness from the plateau of Murcia, where it merges in that of the interior.

Sierra Nevada.

Sierras of south coast.

Lowland valleys.

The only two important lowland valleys of Spain are those of the Ebro and the Guadalquivir. The former occupies the angle in the north east between the Pyrenees

[1] About 3700 feet above the level of Madrid, 2700 feet above that of Segovia.

and the central tableland, and is divided by ranges of heights proceeding on the one side from the Pyrenees, on the other from the base of the Moncayo, into two portions. The uppermost of these, a plateau of between 1000 and 1300 feet above sea-level, is only about one-fourth of the size of the remaining portion, which is chiefly lowland, but is cut off from the coast by a highland tract connecting the interior tableland with spurs from the Pyrenees. The Guadalquivir basin is likewise divided by the configuration of the ground into a small upper portion of considerable elevation and a much larger lower portion mainly lowland, the latter composed from Seville downwards of a perfectly level and to a large extent unhealthy alluvium (*las marismas*). The division between these two sections is indicated by the change in the course of the main stream from a due westerly to a more south-westerly direction.

Rivers. The main water-parting of the peninsula is everywhere near the edge of the tableland on the north, east, and south, and hence describes a semicircle with the convexity to the east. The Ebro alone of the great rivers flows into the Mediterranean. The following table gives the length of the principal Iberian rivers, with the area of their basins,—the length according to different authorities, the area of the basins according to Strelbitsky, whose measurements of area appear to be more trustworthy than those made by him of the length of rivers:—

	Length in English Miles			Area in Square Miles
	Wagner	Pitter	Strelbitsky	
Ebro	442	416	470	38,580
Duero (Douro)	452	507	485	36,710
Tagus	565	553	566	31,865
Guadiana	510	490	316	25,300
Guadalquivir	337	350	374	21,580

With the exception of the Guadalquivir, none of the Iberian rivers is of great service for inland navigation, so far as they lie within the Spanish frontier. On the other hand, those of the east and south are of great value for irrigation, and the Jucar and Segura in the south east are employed in floating timber from the Serrania de Cuenca.

The EBRO and TAGUS are described in separate articles (*q.v.*)

The Miño (Portug. *Minho*, the *Minius* of the Romans) is formed by the union of two small streams in the north of the province of Lugo, and flows first southwards, then on the whole south-westwards to the Atlantic, forming in the lower part of its course the boundary between Spain and Portugal. It becomes navigable for small vessels at Salvaterra, 25 miles above its mouth. Large vessels cannot cross the bar at its mouth. Its only important tributary is the Sil (left), which at the confluence is the larger river of the two.

The Duero (Portug. *Douro*, the *Durius* of the Romans) emerges from the rock as a small stream among the mountains of Urbion on the borders of the provinces of Logroño and Soria, and, after describing a wide sweep to the east, flows westwards across the northern half of the Spanish tableland and across Portugal. For a distance of nearly 60 miles it forms the boundary between the two countries. It begins to be navigable 80 miles above its mouth, but sea going vessels ascend only to Oporto, and even so far, on account of a bar at the mouth, only at high tide. The principal tributaries on the right are the Pisuerga and Esla, on the left the Adaja, Tormes, and Coa (the last in Portugal).

The Guadiana (*i.e.*, *Wádi Ana*, the *Anas* of the ancients) was long believed to take its rise in the district known as the Campo de Montiel, where a string of small lakes known as the Lagunas de Ruidera (partly in Ciudad Real, partly in Albacete) are connected by a stream which, on leaving the last of them, flows north-westwards towards the Zancara and then disappears within two or three miles of that river. About 22 miles to the south-west of the point of disappearance the stream was believed to re emerge in the form of several large springs which form a number of lakes at no great distance from the Zancara, and these lakes are hence known as the "eyes of the Guadiana" (*los ojos de Guadiana*). The small stream issuing from them is known as the Guadiana and soon joins the Zancara. It has now been ascertained, however, that the stream which disappears higher up can have no such course, but that in fact its waters flow or trickle underground to the Zancara itself, which is therefore entitled to be regarded as the upper Guadiana. It has its source not far from that of the Jucar in the east of the plateau of La Mancha, and flows westwards till, under the name of the Guadiana, it turns south-south-west on the Portuguese frontier. In piercing the Sierra Morena it forms a series of foaming rapids, and it begins to be navigable only at Mertola, about 42 miles above its mouth.

The Guadalquivir (*i.e.*, *Wádi el Kebir*, "the great river," the *Bætis* of the ancients), though the shortest of the great rivers of the Peninsula, is the only one that at all seasons of the year is a full-bodied stream, being fed in winter by the rains, in summer by the melting of the snows on the Sierra Nevada. What is regarded as the main stream rises in the Sierra de Cazorla in the east of the province of Jaen, but it does not become a considerable river till after it is joined by the Guadiana Menor (from the Sierra Nevada), on the left bank and the Guadalimar on the right. Lower down the principal tributary which it receives is the Jenil (left). In the days of the Moors the Guadalquivir was navigable for large vessels to Cordova, but, having been allowed to become silted up in the lower part of its course, it has only recently again been made navigable for vessels of 1200 tons burden to Seville.

Lakes. The only considerable lakes in Spain are three coast lagoons,—that of Albufera in the province of Valencia, the Mar Menor in Murcia, and the Laguna de la Janda in Cadiz behind Cape Trafalgar. Small alpine and other lakes are numerous, and small salt lakes are to be found in every steppe region.

Geology. The geological structure of the Spanish Peninsula is comparatively simple. Upon a fundamental platform of ancient crystalline rocks, which had previously been upraised into detached ridges, a series of sedimentary formations was laid down, among which occur representatives of most of the geological systems from the older Palæozoic rocks up to those of Quaternary date. Arranged in order of age, with their respective areas, these various groups of rock are shown in the subjoined table:—

Quaternary	covering	49,477	sq. kilom., or	10.00	% of whole surface
Pliocene	"	9,064	"	1.80	"
Miocene and Oligocene	"	137,867	"	27.85	"
Eocene	"	23,564	"	4.80	"
Cretaceous	"	47,002	"	9.50	"
Jurassic	"	22,697	"	4.45	"
Triassic	"	22,443	"	4.45	"
Carboniferous	"	11,301	"	2.22	"
Devonian	"	5,780	"	1.40	"
Silurian (and Cambrian)	"	114,382	"	23.18	"
Archæan	"	1,694	"	0.35	"
Eruptive rocks of various ages	"	49,665	"	10.00	"

Archæan rocks are exposed in the northern half of the Peninsula, particularly along the great Pyrenean axis, in Galicia, Estremadura, the Sierra Morena, the Sierra Nevada, and Serrania de Ronda. They consist of granites, gneisses, and mica schists, with talc-schists, amphibolites, and crystalline limestones. The oldest Palæozoic strata are referred, from their included fossils, to the Cambrian and Silurian divisions. They range through a vast region of Andalusia, Estremadura, Castile, Salamanca, Leon, and Asturias, and along the flanks of the Pyrenean and Cantabrian chain. They consist of slates, greywackes, quartzites, and diabases. Grits, quartzites, and shales referable to the Devonian system occur in a few scattered areas, the largest and most fossiliferous of these occurring in the Asturias. The Carboniferous rocks of Spain are divisible into three groups, the lowest consisting of limestones with sandstones and shales, the middle of conglomerates and sandstones, and the upper of sandstones, conglomerates, shales, and coals. They lie in detached basins, and have not yet been well explored. One of these areas covers a considerable space in the Asturias, whence it stretches more or less continuously through the provinces of Leon, Palencia, and Santander, covering altogether an area of 6500 square kilometres. Another tract occurs at San Juan de las Abadesas in Catalonia, where it occupies about 200 square kilometres, while a third, about 500 square kilometres in extent, runs from the province of Cordova into that of Badajoz. There are other smaller areas containing little or no coal, but showing by the included plant-remains that the strata undoubtedly belong to the Carboniferous system.

The Triassic system is well developed in the north of the Peninsula along the Cantabrian chain and eastwards to the Mediterranean. It is composed of red and variegated sandstones, dolomites and marls, traversed in some places by ophitic rocks, and containing deposits of gypsum, aragonite, and rock-salt. These strata are overlain by members of the Jurassic series, which are especially conspicuous in the eastern part of the Peninsula.

between Castile and Aragon, along the Mediterranean border, in Andalusia, and likewise along the flanks of the Pyrenees. The Lias is best represented. The Cretaceous system is distributed in four great districts: the largest of these extends through the kingdoms of Murcia and Valencia; a second stretches between the two Castiles; a third is found in the Basque Provinces and the Asturias; and a fourth spreads out along the southern slopes of the Pyrenees from Navarre to the Mediterranean. The lower members of the Cretaceous series include an important freshwater formation (sandstones and clays), which extends from the Cantabrian coast through the provinces of Santander, Burgos, Soria, and Logroño, and is supposed to represent the English Wealden series. The higher members comprise massive hippurite limestones, and in the Pyrenean district representatives of the upper subdivisions of the system, including the Danian.

Deposits of Tertiary age cover rather more than a third of Spain. They are divisible into two great series, according to their mode of origin in the sea or in fresh water. The marine Tertiary accumulations commence with those that are referable to the Eocene series, consisting of nummulitic limestones, marls, and siliceous sandstones. These strata are developed in the basin of the Ebro, and in a belt which extends from Valencia through Murcia and Andalusia to Cadiz. Marine Miocene deposits occupy some small tracts, especially on the coast of Valencia. But most of the sandy Tertiary rocks of that district are Pliocene. The Tertiary masses of Andalusia have coarse conglomerates (Middle Miocene) at their base, followed by thick beds of Bryozoan molasse and younger (Pliocene) beds. These strata are specially noteworthy for containing an important metalliferous deposit, that of the native silver of Herrerias, which is found in a Pliocene bed in the form of flakes, needles, and crystals. But the most extensive and interesting Tertiary accumulations are those of the great lakes which in Oligocene and Miocene time spread over so large an expanse of the tableland. These sheets of fresh water covered the centre of the country, including the basins of the Ebro, Jucar, Guadalaviar, Guadalquivir, and Tagus. They have left behind them thick deposits of clays, marls, gypsum, and limestone, in which numerous remains of the land-animals of the time have been preserved.

Quaternary deposits spread over about a tenth of the area of the country. The largest tract of them is to be seen to the south of the Cantabrian chain; but another, of hardly inferior extent, flanks the Sierra de Guadarrama, and spreads out over the great plain from Madrid to Caceres. Some of these alluvial accumulations indicate a former greater extension of the snowfields that are now so restricted in the Spanish sierras. Remains of the reindeer are found in caves in the Pyrenees.

Eruptive rocks of many different ages occur in different parts of Spain. The most important tract covered by them is that which stretches from Cape Ortegal to Coria in Estremadura and spreads over a large area of Portugal. They likewise appear in Castile, forming the sierras of Gredos and Guadarrama; farther south they rise in the mountains of Toledo, in the Sierra Morena, and across the provinces of Cordova, Seville, Huelva, and Badajoz as far as Evora in Portugal. Among the minor areas occupied by them may be especially mentioned those which occur in the Triassic districts. Of rocks included in the eruptive series the most abundant is granite. There occur also quartz porphyry (Sierra Morena, Pyrenees, &c.), diorite, porphyrite, diabase (well developed in the north of Andalusia, where it plays a great part in the structure of the Sierra Morena), ophite (Pyrenees, Cadiz), serpentine (forming an enormous mass in the Serrania de Ronda), trachyte, liparite, andesite, basalt. The last four rocks occur as a volcanic series distributed in three chief districts—that of Cape Gata, including the south east of Andalusia and the south of Murcia, that of Catalonia, and that of La Mancha.

Climate *Climate.*—In accordance with its southerly position, its differences of elevation, and the variety in its superficial configuration in other respects, Spain presents within its borders examples of every kind of climate to be found on the northern hemisphere, with the sole exception of that of the torrid zone. As regards temperature, the heart of the tableland is characterized by extremes as great as are to be met with in almost any part of central Europe. The northern and north-western maritime provinces, on the other hand, have a climate as equable, and, it may be added, as moist, as that of the west of England or Scotland.

Four zones of climate are distinguished. The first zone may be called that of the tableland, although to it also the greater part of the Ebro basin may be referred. This is the zone of the greatest extremes of temperature. Even in summer the nights are often decidedly cold, and on the high parameras it is not a rare thing to see hoar frost in the morning. In spring cold wetting mists occasionally envelop the land for entire days, while in summer the sky is often perfectly clear for weeks together. At all seasons of the year sudden changes of temperature, to the extent of from 30° to 50° F., are not infrequent. The air is extremely dry, which is all the more keenly felt from the fact that it is almost constantly in motion. At Madrid (2150 feet above sea-level) it regularly freezes so hard in December and January that skating is carried on on the sheet of water in the Buen Retiro; and, as winter throughout Spain, except in the maritime provinces of the north and north-west, is the season of greatest atmospheric precipitation, snowfalls are frequent, though the snow seldom lies long except at high elevations. The summers, on the other hand, are not only extremely warm but almost rainless, the sea winds being deprived of their moisture on the edge of the plateau. In July and August the plains of New Castile and Estremadura are sunburnt wastes; the roads are several inches deep with dust; the leaves of the few trees are withered and discoloured; the atmosphere is filled with a fine dust, producing a haze known as *calina*, which converts the blue of the sky into a dull grey. In the greater part of the Ebro basin the heat of summer is even more intense. The treeless mostly steppe-like valley with a bright-coloured soil acts like a concave mirror in reflecting the sun's rays, and, moreover, the mountains and highlands by which the valley is enclosed prevent to a large extent the access of winds, and thus hinder the renewal of the air, which in the lowest parts is little disturbed.

The second zone is that of the Mediterranean provinces, exclusive of those of the extreme south. In this zone the extremes of temperature are less, though the summers here also are warm, and the winters decidedly cool, especially in the north-east.

The southern zone, to which the name of African has been given, embraces the whole of Andalusia as far as the Sierra Morena, the southern half of Murcia, and the province of Alicante. In this zone there prevails a genuine subtropical climate, with extremely warm and almost rainless summers and mild winters, the temperature hardly ever sinking below freezing-point. The hottest part of the region is not the most southerly district but the bright coloured steppes of the coast of Granada, and the plains and hill terraces of the south east coast from Almeria to Alicante. Snow and frost are here hardly known. It is said that at Malaga snow falls only about once in twenty five years. The winter, in fact, is the season of the brightest vegetation: after the long drought of summer the surface gets covered once more in late autumn with a fresh green varied with bright coloured flowers, and so it remains the whole winter through. On the other hand, the eastern part of this zone is the part of Spain which is liable to be visited from time to time by the scorching and blasting *leveche*, the name given in Spain to the sirocco, as well as by the *solano*, a moist and less noxious east wind.

The fourth zone, that of the north and north-west maritime provinces, presents a marked contrast to all the others. The temperature is mild and equable; the rains are abundant all the year round, but fall chiefly in autumn, as in the west of Europe generally. Monthly roses bloom in the gardens at Christmas as beautifully and as plentifully as in summer. The chief drawback of the climate is an excess of rain in some parts, especially in the west. Santiago de Compostella, for example, has one of the highest rainfalls on the mainland of Europe (see table below).

The figures given in the following table (I.),[1] although based only on data of short periods (from 3½ to 20 years), will help to illustrate the preceding general remarks. Greenwich is added for the sake of comparison.

Station		Height in feet	Mean Temperature, F.			Rain-fall in inches
			Jan.	July.	Year.	
Tableland zone	Leon	2600	37°	73°	53°	19
	Madrid	2150	41	76	56	15
Southern zone	San Fernando	90	52	75	63	30
	Malaga	75	54	79	70	
Mediterranean zone	Murcia	140	49	79	63	14
	Mahon		52	77	64	27
Northern maritime zone	Bilbao	50	46	70	58	46
	Oviedo	750	43	66	54	36
	Santiago	750	45.5	66	55	66
	Greenwich		39	63	50	25

Vegetation.—The vegetation of Spain exhibits a variety in keeping with the differences of climate just described. **Flora** The number of endemic species is exceptionally large, the number of monotypic genera in the Peninsula greater than in any other part of the Mediterranean domain. The endemic species are naturally most numerous in the mountains, and above all in the loftiest ranges, the Pyrenees and the Sierra Nevada; but it is a peculiarity of the Spanish tableland, as compared with the plains and tablelands of central Europe, that it also possesses a considerable number of endemic plants and plants of extremely restricted range. This fact, however, is also in harmony with the physical conditions above described, being explained by the local varieties, not only of climate, but also of

[1] By conversion from Th. Fischer's *Klima der Mittelmeerländer*.

soil Altogether no other country in Europe of equal extent has so great a wealth of species as Spain According to the *Prodromus Floræ Hispanicæ* of Willkomm and Lange (completed in 1880), the number of species of vascular plants then ascertained to exist in the country was 5096

Spain may be divided botanically into four provinces, corresponding to the four climatic zones

In the tableland province (including the greater part of the Ebro valley) the flora is composed chiefly of species characteristic of the Mediterranean region, generally of species confined to the Peninsula A peculiar character is imparted to the vegetation of this province by the growth over large tracts of evergreen shrubs and large herbaceous plants belonging to the *Cistaceæ* and *Labiatæ* Areas covered by plants of the former group are known to the Spaniards as *jarales*, and are particularly extensive in the Mancha Alta and on the slopes of the Sierra Morena, where the ladanum bush (*Cistus ladaniferus*) is specially abundant, those covered by plants of the latter group are known as *tomillares* (from *tomillo*, thyme), and occur chiefly in the south, south west, and east of the tableland of New Castile In the central parts of the same tableland huge thistles (such as the *Onopordum nervosum*), centaureas, artemisias, and other *Compositæ* are scattered in great profusion From the level parts of these tablelands trees are almost entirely absent On the lofty parameras of Soria and other parts of Old Castile the vegetation has an almost alpine character

The southern or African province is distinguished chiefly by the abundance of plants which have their true home in North Africa (a fact easily understood when we consider the geologically recent land connexion of Spain with that continent), but is also remarkable for the occurrence within it of numerous Eastern plants (natives of Syria and Asia Minor), and plants belonging to South Africa and the Canaries, as well as natives of tropical America which have become naturalized here (see below under *Agriculture*) In this province the maritime parts of Malaga and Granada present scenes of almost tropical richness and beauty, while, on the other hand, in Murcia, Alicante, and Almeria the aspect is truly African, fertile oases appearing in the midst of rocky deserts or barren steppes A peculiar vegetation, consisting mainly of low shrubs with fleshy glaucous leaves (*Inula crithmoides*, &c), covers the marismas of the Guadalquivir and various parts of the south-west coast where salt-marshes prevail Everywhere on moist sandy ground are to be seen tall thickets of *Arundo Donax*

The Mediterranean province is that in which the general aspect of the vegetation agrees most closely with that of southern France and the lowlands of the Mediterranean region generally On the lower slopes of the mountains and on all the parts left uncultivated the prevailing form of vegetation consists of a dense growth of shrubs with thick leathery leaves, such as are known to the French as *maquis*, to the Italians as *macchie*, and are called in Spanish *monte bajo*,[1] shrubs which, however much they resemble each other in external appearance, belong botanically to a great variety of families

The northern maritime province, in accordance with its climate, has a vegetation resembling that of central Europe Here only are to be found rich grassy meadows adorned with flowers such as are seen in English fields, and here only do forests of oak, beech, and chestnut cover a large proportion of the area The extraordinary abundance of ferns (as in western France) is likewise characteristic

Forests The forest area of Spain generally is relatively small The whole extent of forests is estimated at little more than 3 millions of hectares (7½ million acres), or less than 6 per cent of the area of the kingdom Evergreen oaks, chestnuts, and conifers are the prevailing trees The cork oaks of the southern provinces and of Catalonia are of immense value, but the groves containing this tree have suffered greatly from the reckless way in which the product is collected Among other characteristic trees are the Spanish pine (*Pinus hispanica*), the Corsican pine (*P Laricio*), the Pinsapo fir (*Abies Pinsapo*), and the *Quercus Toza*, the last belonging to the slopes of the Sierra Nevada Besides the date-palm the dwarf-palm grows spontaneously in some parts of the south, but it nowhere makes up a large element of the vegetation

Steppes The Spanish steppes deserve a special notice, since they are not confined to one of the four botanical provinces, but are found in all of them except the last Six considerable steppe regions are counted —(1) that of Old Castile, situated to the south of Valladolid, and composed chiefly of hills of gypsum, (2) that of New Castile, in the south east (the district of La Mancha), (3) the Aragonese, occupying the upper part of the basin of the Ebro, (4) the littoral, stretching along the south-east coast from Alicante to the neighbourhood of Almeria, (5) the Granadine, in the east of Upper Andalusia (the former kingdom of Granada), and (6) the Bætic, in Lower Andalusia, on both sides of the valley of the Jenil All of these are originally salt-steppes, and, where the soil is still highly impregnated with salt, have only a sparse covering of shrubs, mostly members of the *Salsolaceæ*, with thick, greyish green, often downy leaves A different aspect is presented by the grass steppes of Murcia, La Mancha, the plateaus of Guadix and Huescar in the province of Granada, &c , all of which are covered chiefly with the valuable esparto grass (*Macrochloa tenacissima*)

Fauna *Fauna* —The Iberian Peninsula belongs to the Mediterranean subregion of the Palæarctic region of the animal kingdom, a division which includes also the north of Africa The forms that betray African affinities are naturally to be found chiefly in the south Among the mammals that fall under this head are the common genet (*Genetta vulgaris*), which extends, however, pretty far north, and is found also in the south of France, the fallow deer, the porcupine (very rare), and a species of ichneumon (*Herpestes widdringtonii*), which is confined to the Peninsula, and is the only European species of this characteristically African genus The magot or Barbary ape (*Inuus ecaudatus*), the only species of monkey still found wild in Europe, is also a native of Spain, but the only flock still surviving, on the rock of Gibraltar, has often been on the point of extinction, and has to be renewed from time to time by importations from the north of Africa Of the mammals in which Spain shows more affinity to the fauna of central and northern Europe, some of the most characteristic are the Spanish lynx (*Lynx pardinus*), a species confined to the Peninsula, the Spanish hare (*Lepus madritensis*), and the species mentioned in the article PYRENEES The birds of Spain are very numerous, partly no doubt in consequence of the fact that the Peninsula lies in the route of those birds of passage which cross from Africa to Europe or Europe to Africa by way of the Straits of Gibraltar Many species belonging to central Europe pass the winter in Spain, especially on the south eastern coasts and in the valley of the Guadalquivir Innumerable, for example, are the snipes which in that season are killed in the latter district and brought to the market of Seville Among the birds of prey may be mentioned, besides the cinereous and bearded vultures, the Spanish vulture (*Gyps occidentalis*), the African or Egyptian vulture (*Neophron percnopterus*), which is found among all the mountains of the Peninsula, the Spanish imperial eagle (*Aquila adalberti*), the short-toed eagle (*Circaetus gallicus*), the southern eagle owl (*Bubo atheniensis*), besides various kites and falcons Among gallinaceous birds, besides the red legged partridge, which is met with everywhere on the steppes, there are found also the *Pterocles alchata* and *P arenarius*, and from among the birds of other orders the southern shrike (*Lanius meridionalis*), the Spanish sparrow (*Passer cyaneus*), and the blue magpie (*Cyanopica cooki*) may be singled out as worthy of mention The last is highly remarkable on account of its distribution, it being confined to Spain while the species most closely allied to it (*Cyanopica cyanea*) belongs to the east of Asia The flamingo is found native in the Balearic Islands and on the southern coasts, and occasionally a stray specimen is to be seen on the tableland of New Castile Other birds peculiar to the south are two species of quails, the Andalusian hemipode (*Turnix sylvatica*), confined to the plains of Andalusia, the southern shearwater (*Puffinus cinereus*), and other water-birds Amphibians and reptiles are particularly numerous in the southern provinces, and among these the most remarkable are the large southern or eyed lizard (*Lacerta ocellata*), which sometimes attains 3 feet in length and is very abundant, the *Platydactylus saccicularis*, the grey amphisbæna (*Blanus cinereus*), the European pond tortoise (*Emys europæa*), and another species, *Emys sigriz* Insect life is remarkably abundant and varied More than 350 species of butterflies, many of them endemic, have been counted in the province of Madrid alone Besides the ordinary European scorpion, which is generally distributed in southern Europe, there is another species, the sting of which is said to be still more severe, found chiefly in the basin of the Ebro Trout abound in the mountain streams and lakes, barbel and many other species of *Cyprinidæ* in the rivers of the plains For the sea fauna, see under *Fisheries* below

Extent *Extent* —The total area of the mainland of Spain, according to the calculations of Strelbitsky, is 495,612 square kilometres or 191,365 square miles, that of the Balearic Islands 4982 square kilometres or 1923 square miles, and that of the Canary Islands, which, though belonging geographically to Africa, are administratively associated with the kingdom of Spain, 7611 square kilometres or 2939 square miles, so that the total area of the kingdom is 508,205 square kilometres or 196,225 square miles This total agrees pretty closely with that in Justus Perthes's table given below (Table II), although considerable differences will be observed in the areas assigned to the mainland provinces and the two island groups respectively The length of the coast line of the mainland, according to Strelbitsky, is 2662 miles, which is equivalent to 1 mile of coast for every 72 square miles of area, about the same proportion as in France The greatest length from north-east to south-west is 420 miles

Administrative divisions *Territorial Divisions and Population* —For administrative purposes the kingdom of Spain has since 1833 been divided into forty-nine provinces, forty-seven of which belong to the mainland

1 As distinguished from *monte alto*, the collective name for forest trees

Before 1833 the mainland was divided into thirteen provinces, also enumerated below, which took their names from the ancient kingdoms and principalities out of which the modern kingdom was gradually built up. The present provinces are subdivided into judicial districts (*partidos judiciales*) and communes (*ayuntamientos*).

Population. It is probable that the population of Spain attained its highest development during the period of the early Roman empire, when it has been estimated, though of course on imperfect data, to have numbered forty or fifty millions. The best evidence of a dense population in those days is that afforded by the specific estimates of ancient writers for some of the larger cities. The population of Tarraco (Tarragona) was estimated at 2½ millions, and that of Nova Carthago (Cartagena), Italica (Sevilla la Vieja), and others at several hundreds of thousands. Emerita Augusta (Merida) had a Roman garrison of 90,000 men, which also implies a large population.[1]

Table II.—Area and Population of the Former and Present Provinces.

Provinces.	Area in Square Miles.	Population 1857.	Population Dec. 31, 1877.	Increase or Decrease.	Pop. per sq. m. 1877.
NEW CASTILE	28,018	1,477,915	1,627,131	+ 10 1	58
Madrid	2,997	475,785	594,194	+ 24 8	198
Guadalajara	4,869	199,088	201,288	+ 1 1	41

[1] Garrido, *La España Contemporanea*, i. 489.

The first Spanish census was made in 1594, but some of the provinces now included in the kingdom were for one reason or another not embraced in the enumeration, so that the total population assigned to Spain within its present limits for that date is obtained by adding the results of enumerations at different dates in the provinces then excluded. The total thus arrived at is 8,206,791. No other census took place till 1787, when the total was found to be 10,268,150, and this census was followed by another in 1797, when the population was returned as 10,541,221. Various estimates were made within the next sixty years, but the census of 1857 proved that some of these estimates must have been greatly below the truth. The total population then ascertained to exist in Spain was 15,464,340, an increase of not much less than 50 per cent since the census of 1797. The last census took place on December 31, 1877, and the total population then ascertained, 16,631,869, shows an increase of only 7½ per cent., equal to an annual increase at the rate of 0 35 per cent.—lower than in any other country in Europe except France.

As Table II. shows, the density of population in Spain as a whole is little more than that of the most thinly peopled county of England in 1881 (Westmoreland, 82 to the square mile). Looking at the old provinces, we find that the most thickly peopled are all maritime, and that all the maritime provinces except Andalusia and Murcia have a density exceeding 100 to the square mile. The most densely peopled province of all is not Catalonia, in which manufacturing industries are so highly developed, nor the Basque Provinces with their great iron industry, but Galicia, where there are neither manufactures nor minerals to speak of, but where tillage occupies a relatively larger area than anywhere else in Spain. Of the modern provinces the most thinly peopled are Cuenca and Ciudad Real, in the barren region of the east and south of New Castile, and Albacete in the Murcian steppe, in each case the density being less than half of that of the most thinly peopled English county. The column indicating the increase (or decrease) per cent. of the population between 1857 and 1877 shows that, outside of the province in which the capital is situated, the increase points chiefly to the recent development of manufactures and mining,—to the development of copper mines in Huelva, lead mines in Jaen, iron mines in Vizcaya, cotton manufactures in Barcelona. In Murcia it points no doubt to the great development of the trade in esparto as well as in southern fruits. On the other hand the decrease in Lerida and Gerona indicates how the attraction of higher wages in the manufacturing districts of Catalonia tends to deplete the neighbouring country districts.

As regards the distribution of population between town and country, Spain contrasts in a marked manner with Italy, Spain having but few large towns and a relatively large country population. In 1877 there were only five towns with more than 100,000 inhabitants.—Madrid (397,816), Barcelona (248,943), Valencia (143,861), Seville (134,318), and Malaga (115,882). Only nine had a population between 50,000 and 100,000, and besides these only 171 had a population above 10,000.

The birth rate in Spain is 33 9 per thousand as against 35 1 in England and Wales, the death-rate 29 1 (21 4 in England and Wales), the number of marriages per thousand inhabitants was 7 32[2] (8 08 in England and Wales). The percentage of illegitimacy is 5 6. The number of males born for every 100 females averages 107, a higher proportion than in any other country of Europe for which statistics are obtainable except Greece (112) and Roumania (111).

Foreign Possessions.—The population of the principal foreign possessions of Spain in 1877 numbered 7,822,123, made up as follows:— Foreign possessions.

Cuba	1,521,684	Philippine Islands	5,567,685
Porto Rico	731,648	Fernando Po	1,106

Besides the Philippine Islands in the Eastern Archipelago, Spain possesses the greater part of the Sulu Archipelago, and, in the Pacific, the Marianne, Pelew, and Caroline Islands. Off the Guinea coast she possesses the Island of Annobon as well as that of Fernando Po, and on the coast itself the district round Corisco Bay. She has likewise declared a protectorate over the West African coast between Capes Bojador and Blanco (desert of Sahara). The presidios, whose population is given in Table II., are Peñon de Velez, Alhucemas, and Melila (besides Ceuta).

Agriculture.—Agriculture is by far the most important Spanish industry, nearly 73 per cent. of those whose occupations were classified at the census of 1877 being entered under that head. In general it is in a backward condition, and is now much less productive than in the time of the Romans and again under the Moors. The expulsion of the latter people in many places inflicted upon agriculture a blow from which it has not recovered to this day. Aragon and Estremadura, the two most thinly peopled of all the old provinces, and the eastern half of Andalusia (above Seville), Agriculture.

[2] In all these cases the figures for Spain are the means of the years 1865-70 and 1880-83 inclusive.

have all suffered particularly in this manner, later occupiers never having been able to rival the Moors in overcoming the sterility of nature, as in Aragon, or in taking advantage of its fertility, as in Andalusia and the Tierra de Barros. The implements in general use are of the rudest description. The plough is merely a pointed stick shod with iron crossed by another stick which serves as a share, scratching the ground to the depth of a few inches. But the regular import now of agricultural implements (chiefly from England and France) betokens an improvement in this respect. In general there has been considerable improvement in the condition of agriculture since the introduction of railways, and in every province there is a royal commissioner entrusted with the duty of supervising and encouraging this branch of industry. Among other institutions for the promotion of agriculture the royal central school at Aranjuez, to which is attached a model farm, is of special importance.

The provinces in which agriculture is most advanced are those of Valencia and Catalonia, in both of which the river valleys are thickly seamed with irrigation canals and the hill slopes carefully terraced for cultivation. In neither province is the soil naturally fertile, and nothing but the untiring industry of the inhabitants, favoured in the one case by the rivers which traverse the province from the tableland of New Castile and the numerous small streams (*nacimientos*) that issue from the base of the limestone mountains of which the province is largely composed, and in the other case by the numerous torrents from the Pyrenees, has converted them into two of the most productive regions in Spain. In the Basque Provinces and in Galicia the cultivable area is quite as fully utilized but in these the difficulties that have to be contended with are not so great. The least productive tracts, apart from Aragon and Estremadura, are situated in the south and east of New Castile, in Murcia, and in Lower Andalusia—the marshes or *marismas* of the lower Guadalquivir and the *arenas gordas* between that river and the Rio Tinto. By far the greater part of the tableland, however, is anything but fertile, the principal exceptions being the Tierra de Campos, said to be the chief corn growing district in Spain, occupying the greater part of Palencia in the north west of Old Castile, and the Tierra de Barros, in the portion of Badajoz lying to the south of the Guadiana in Estremadura, another district noted for its corn.

Except in Leon and the provinces bordering on the Bay of Biscay and the Atlantic irrigation is almost everywhere necessary for cultivation, at least in the case of certain crops. Almost all kinds of vegetables and garden fruits, oranges, rice, hemp, and other products are generally grown solely or mainly on irrigated land, whereas most kinds of grain, vines, and olives are cultivated chiefly on dry soil. The water used for irrigation is sometimes derived from springs and rivers in mountain valleys, whence it is conveyed by long canals (*acequias*) along the mountain sides and sometimes by lofty aqueducts to the fields on which it is to be used. Sometimes the water of entire rivers or vast artificial reservoirs (*pántanos*) is used in feeding a dense network of canals distributed over plains many square miles in extent. Such plains in Valencia and Murcia are known by the Spanish name of *huertas* (gardens), in Andalusia by the Arabic name of *vegas*, which has the same meaning. Many of the old irrigation works,—such, for example, as those of the plain of Tarragona,—date from the time of the Romans, and many others from the Moorish period, while new ones are still being laid out at the present day. Where no running water is available for irrigation, water is often obtained from wells by means of water wheels (*norias*) of simple construction. In most cases such wheels merely have earthenware pitchers attached to their circumference by means of wisps of esparto, and are turned by a horse harnessed to a long arm fitted to a revolving shaft. In recent years many artesian wells have been sunk for irrigation. According to Higgin (see Bibliography), the total area of irrigated land in Spain amounts to 4439 square miles. The effect of irrigation is shown by the fact that the irrigated portion of Murcia has a population of 1681 to the square mile as against 101 for the whole province, and Orihuela a population of 767 to the square mile as against 194 for the whole province of Alicante to which it belongs.

Cereals. Cereals constitute the principal object of cultivation, and among these wheat ranks first, the next in importance being barley, the chief fodder of horses and mules. Both of these grains are cultivated in all parts—on the plains as well as among the mountains, but chiefly on the more level parts of the two Castiles and Leon, and on the plains of the basin of the Guadalquivir. Oats and rye are cultivated only in the higher parts of the mountains, the former as a substitute for barley in feeding horses and mules, the latter as a breadstuff. Maize also is cultivated in all the provinces, nevertheless the total extent of its cultivation is limited, since, being a summer crop, it requires irrigation except in the Atlantic provinces, and other products generally yield a more profitable return where irrigation is pursued. Rice is cultivated on a large scale only in Valencia. Among cereals of less importance are buckwheat (in the mountainous regions of the north), millets, including both the common millet (*Panicum miliaceum*) and the so called Indian millet (*Sorghum vulgare*, the *joari* of India, the *durrah* of Africa), and even (in La Mancha) guinea corn (*Penicillaria spicata*). As to the quantity of cereals produced in the country we are without official information, and the estimates of the average annual production of cereals of all kinds are very discrepant, varying from 250 to 430 million bushels. The average production of wheat alone has been estimated[1] at 177 million bushels, and the average produce of that crop per acre at 11.13 bushels (that of England being about 29 bushels). If these figures can be taken as approximately correct, it follows that the average acreage under wheat in Spain is nearly 16 million acres, or between five and six times the average in Great Britain, which has less than half the area of Spain. The produce per acre just indicated places Spain among those countries of Europe in which the return is least, which is probably fully accounted for by the backward state of cultivation generally and in particular by the small expenditure on manure. As a rule, in fact, the straw left on the ground is the only manure which the land receives.

The cereal and especially the wheat production of the country regularly furnishes a considerable export. During the five years 1879–83 the value of the export of cereals and pod-fruits of all kinds was nearly 3 per cent. of the total value of the exports, but this export is balanced by a large import, especially of wheat flour. In bad years, indeed, the value of the import under this head greatly exceeds that of the export.

In the production of pod fruits and kitchen vegetables Spain is ahead of all other countries in Europe. The chick pea forms part of the daily food of all classes of the inhabitants, and among other pod fruits largely cultivated are various kinds of beans and pease, lentils (*Ervum lens*), Spanish lentils (*Lathyrus sativus*) and other species of *Lathyrus*, lupines, &c. The principal fodder crops are lucerne (*Medicago sativa*) and esparcette (a variety of sainfoin). Clover, particularly crimson clover (*Trifolium incarnatum*), is grown in the northern provinces. Among vegetables garlic and onions take the chief place, and form an indispensable part of the diet of all Spaniards, besides these, tomatoes and Spanish pepper are the principal garden crops. It is upon such crops that the Spanish peasant in general bestows his chief care.

As regards the quantity of the product wine comes next after cereals among the objects of cultivation in Spain. Wine. Here again we are dependent only upon vague estimates of the average amount produced, but usually the average annual Spanish production of wine is estimated at between 440 and 500 million gallons, an estimate which places Spain third (next after France and Italy) among the wine producing countries of Europe. So far as quantity is concerned the principal wine producing districts are in the north-east, but the only wines of Spain which have a world wide reputation are those of the south, and more particularly those which take the name of "sherry," from the town of Jerez, in the neighbourhood of which they are grown. The total area under the vine is estimated at about 3,480,000 acres (or about 2.8 per cent of the entire surface), and of this total about 772,700 acres belong to the Catalonian provinces, chiefly Barcelona. The provinces which produce most wine are Barcelona, Saragossa, Cadiz, and Malaga, the annual amount of the production being in the order in which the provinces are mentioned.

The official tables distinguish the wines exported from Spain as common wines, sherry and similar wines, and other full-bodied wines (*vino generoso*). The returns of recent years, as will be seen from Table III given below, show that of late an enormous increase has taken place in this export both as regards quantity and value, this increase being chiefly due to the extension of the export of the commoner wines to France by way of Barcelona.

	Average of Five Years 1874–78		Average of Five Years 1879–83		1884	
	Thousands of Gallons exported	Value in thousands of Pounds	Thousands of Gallons exported	Value in thousands of Pounds	Thousands of Gallons exported	Value in thousands of Pounds
Common wine	40,524	2,547	133,562	7,748	135,432	8,865
Sherry and similar wines	6,446	2,466	5,874	2,137	5,368	1,465
Other full bodied wines	2,244	470	3,388	879	2,420	493
Total	49,214	5,483	142,824	10,764	143,220	10,823

There is also a large export of grapes and raisins, especially from the southern provinces (Malaga and Almeria). The average quantity of the two together exported in each of the five years

[1] In an article by M. P. A. Delboy in the *Journal of the Statistical Society* for March 1884, translated from the *Journal de la Société de Statistique de Paris*, September 1883.

1879–83 was about 50 millions of kilogrammes (110 million ℔), the average value about £1,560,000 The vines whose fruit is intended for table use as grapes or raisins are trained on espaliers or on trees, especially the nettle-tree (*Celtis australis*)

Fruits

Among fruit trees the first place belongs to the olive, which is estimated to cover about 3 per cent of the surface, and accordingly about an equal area to that occupied by the vine Its range in Spain embraces the whole of the southern half of the tableland, the greater part of the Ebro valley, and a small strip on the west coast of Galicia Along the base of the Sierra Morena from Andujar to the vicinity of Cordova there run regular forests of olives, embracing hundreds of square miles The annual production of oil is estimated at 55 millions of gallons, and might be greatly increased in quantity and improved in quality if more attention were bestowed upon the cultivation of the trees and the preparation of the oil Oranges excluded from the plateau by the severity of the winter cold, are grown in great quantity on the plains of Andalusia and all round the Mediterranean coast, and figs, almonds, pomegranates, carobs, and other southern fruits are also grown abundantly in all the warmer parts, the first two even in central Spain and the more sheltered parts of the northern maritime provinces In these last, however, the prevailing fruit trees are those of central Europe, and above all the apple, which is very extensively cultivated in Asturias, the Basque Provinces, and Navarre The date palm is very general in the south eastern half of the kingdom, but is cultivated for its fruit only in the province of Alicante, in which lies the celebrated date grove of Elche In the southern provinces flourish also various subtropical exotics, such as the banana, the West Indian cherimoya, and the prickly pear or Indian fig (*Opuntia vulgaris*) the last frequently grown as a hedge plant, as in other Mediterranean countries, and extending even to the southern part of the tableland It is specially abundant on the Balearic Islands The agave or American aloe is cultivated in a similar manner throughout Andalusia Cotton is now cultivated only here and there in the south, but, on the other

Sugar

hand, sugar cane, the cultivation of which was introduced by the Arabs in the 12th century or later, and was of great importance in the kingdom of Granada at the time of the expulsion of the Moors at the close of the 15th century, but has since undergone great vicissitudes, first in consequence of the introduction of the cane into America, and afterwards because of the great development of beet sugar in central Europe, is now becoming every year more and more of a staple in the provinces of Granada, Malaga, and Almeria The annual production on the Spanish mainland is estimated at about 75,000,000 ℔ Such prosperity as this branch of agriculture at present enjoys is largely due to the protection which it receives at the hands of the Spanish Government A duty imposed on all imported sugars in 1876, while inflicting a severe blow on the Spanish colony of Cuba, has had the desired effect of stimulating the native production, but according to the law at present in force (passed on June 30, 1882) the amount of this duty, as far as regards the produce of the Spanish colonies, is being gradually reduced, and the duty will be entirely abolished on July 1, 1892

Among the vegetable products not yet mentioned the most important are the mulberry, grown in almost all provinces, but principally in those bordering on the Mediterranean, and above all in Valencia, the chief seat of the Spanish silk production and manufacture, hemp and flax, grown chiefly in Galicia and other northern provinces, among dye plants, madder, saffron, woad (*Isatis tinctoria*), and wild woad or dyer's weed (*Reseda luteola*), ground nuts (*Arachis hypogæa*), grown for their oil, for the preparation of which the nuts are exported in considerable quantity to France, liquorice, cummin, colocynth, &c

Live stock

The rearing of animals has likewise been receiving in recent years increased attention at the hands of both Government and people, though here also we are without recent official statistics to show the consequent advance The middle of the present century appears to have been the time when this industry was at its lowest point, and the following table (IV) shows the increase in numbers that has taken place at certain subsequent dates for which official returns or estimates are obtainable —

	1858	Enumeration Sept 24, 1865	Estimate 1878
Horses	298,722	672,559	700,000
Mules	499,172	1,001,878	1,200,000
Asses	496,516	1,290,814	1,300,000
Cattle	1,557,033	2,904,598	3,000,000
Sheep	16,443,950	22,054,967	23,000,000
Goats	3,034,701	4,429,576	4,500,000
Swine	1,272,978	4,264,817	4,500,000
Camels		3,104	

In 1865 horses were reared chiefly in the provinces of Seville, Coruña, and Cadiz, mules in Toledo, Cuenca, Teruel, Saragossa, and Badajoz, asses in Badajoz, Toledo, Murcia, Seville, and Granada, cattle in Oviedo, Coruña, Leon, and Pontevedra, sheep in Badajoz, Leon, Teruel, Soria, and Saragossa, goats in Caceres and Badajoz, camels mainly on the Canary Islands, the total number on the Spanish mainland at the date of the enumeration being less than a hundred Badajoz was the richest of the provinces in live stock of all kinds, containing about one fourteenth of the total number of domestic animals in the kingdom

The only animals belonging to Spain still noted for their excellence are mules and asses, which are recognized as the best to be found anywhere The quality of the horses has been greatly improved, however, since the establishment of Government studs more than forty years ago Besides the cattle reared throughout the kingdom for field labour and (in the northern provinces) for regular dairy farming, bulls for the great national pastime of bull-fighting are specially reared in many parts of the country, particularly in the forests of Navarre, the mountains separating the two Castiles, the Sierra Morena, and the Serrania de Ronda in Granada, and also in separate enclosures on the islands of the Guadalquivir Spanish sheep, which in former times enjoyed so high a reputation and formed so important a part of the national wealth, are far from having the same relative importance at the present day, though sheep rearing also is sharing in the general rise of agricultural and other industries The most famous breeds of Spanish sheep are the merinos or migrating sheep, which once brought immense revenues to the state as well as to the large proprietors to whom they mostly belonged These sheep, which are distinguished by their long slim legs and still more by their long wool, are pastured in different districts in summer and winter Their winter quarters are in the lower parts of Leon and Estremadura, La Mancha, and the lowlands of Andalusia, their summer quarters the more mountainous districts to the east and north (Plasencia in the province of Caceres, Avila, Segovia, Cuenca, Valencia), which are not so much affected by the summer droughts of the Peninsula The mode of the migration and the routes to be followed are prescribed by law Each herd consists of about 10,000 individuals, under the command of a *mayoral*, and is divided into sections containing about 1000 each, each section under the charge of an overseer (*capataz*), who is assisted by a number of shepherds (*pastores*) attended by dogs The shepherds, rudely clad in a sleeveless sheepskin jacket, the wool outside, and leather breeches, and loosely wrapped in a woollen mantle or blanket, are one of the most striking and characteristic objects in a Spanish landscape, especially on the tableland The migration to the summer quarters takes place at the beginning of April, the return at the end of September At one time the owners of merino herds enjoyed the right of pasturing their herds during their migrations on a strip of ground about 100 yards in breadth bordering the routes along which the migrations took place, a strip which had accordingly to be left uncultivated, but this right (the *mesta*, as it was called) was abolished in 1836 as prejudicial to cultivation Since that date the migrating sheep have been compelled to keep the roads The average quantity of wool exported in the five years 1879–83 was about 9,000,000 ℔ Even in the best of the years (1883–84) the total export of Spanish wool to all countries was only about one thirtieth of the total average import of that commodity into the United Kingdom during the corresponding period

Bees are reared chiefly on the cistus heaths and the districts abounding in *tomillares* (see p 297) The rearing of the silkworm on the mulberry trees of the Mediterranean provinces has already been referred to, the total annual production of raw silk in Valencia is estimated at 1,500,000 ℔, in Murcia at 500,000 ℔, and in Catalonia at 200,000 ℔ The rearing of the cochineal-insect, which was introduced into southern Spain in 1820, is being carried on with more and more success, especially round Malaga, Velez Malaga, and Motril

Fisheries —The catching of tunnies, sardines, anchovies, and salmon on the coasts employs large numbers of fishermen, and the salting, smoking, and packing of the first three give employment to many others Spanish fishermen likewise dive for coral on the coasts of Andalusia and the north of Africa The fishermen of Catalonia and Valencia have the greatest reputation for their skill The centre of the principal tunny fisheries of Spain is a small rocky islet called Cristina about three leagues from the mouth of the Guadiana The fishing lasts from May to August, that of sardines from August to the end of January The average value of the export of fish in 1879–83 was nearly £120,000 Fisheries.

Minerals —The mineral resources of Spain are vast and varied, but are as yet far from being adequately turned to account No European country produces so great a variety of minerals in large amount, and in the production of copper ore, lead ore, and quicksilver Spain heads the list In the production of salt and silver it is excelled only by Austria-Hungary, and, as regards silver, not always even by it The following table (V) gives particulars regarding the production of some of the principal minerals in the years named — Minerals.

	1863	1883					
	Thousands of Metric Tons [1] produced	Thousands of Metric Tons produced	Value in thousands of Pounds at the Mine	Persons employed			Number of productive Mines
				Men	Women	Children	
Iron ore	223	4,726	506 1	12,157	472	2 550	716
Lead ore	270	280	1,405 2	14,874	110	2,538	871
Argentiferous lead ore	40	25	157 5	3,578	72	192	92
Silver ore		23	88 3	539	2	14	16
Copper ore	246	2,455	1,094 5	9 716	684	1,265	38
Mercury	19	23	209 1	2 991	1	309	12
Zinc	481	54	56 4	1,572	111	297	97
Common salt		202 [2]	17 4	371	94	105	53
Coal		1,044	463 6	7,255	680	1,365	465

Of the minerals mentioned in the preceding table it will be seen that iron and copper ores are those which show the greatest advance as compared with 1863 The production of these two ores advanced with rapid strides during the ten years 1874–1883 In the former year the production of both stood at about 500,000 tons The iron ore is chiefly obtained in Vizcaya and Murcia, the former yielding by far the greatest quantity (in 1883 four-fifths of the total production of Spain), but the latter yielding the best quality (average value of Murcian iron in 1883, 5 pesetas=4s per ton at the mine, as against 2 25 pesetas, or 1s 9½d , the average for the Vizcayan ore) All except a small fraction of the copper ore is obtained from the province of Huelva, in which lie the well known mines of Rio Tinto The lead ore is obtained chiefly in Murcia and Jaen The famous mines of Linares belong to the latter province Argentiferous lead is chiefly produced in Almeria, which also produces most of the silver ore of other kinds except argentiferous copper ore, which is entirely obtained from Ciudad Real The still more celebrated cinnabar (mercury) mines of Almaden, the richest in the world till the discovery of the Californian mines of New Almaden, belong to Ciudad Real, and this province, together with that of Oviedo, furnishes the whole of the Spanish production of this mineral. Spanish salt is partly marine, partly derived from brine springs and partly from rock-salt, of which last there is an entire mountain at Cardona in Barcelona Coal is chiefly obtained in Oviedo, Palencia, and Cordova The production is quite insignificant compared with the extent of the coal bearing beds, which are estimated to cover an area of about 3500 square miles, of which nearly a third belongs to Oviedo, between one eighth and one seventh to Burgos and Soria, and about one tenth to Teruel and Cordova Among the less important Spanish minerals are manganese (chiefly in Ciudad Real), antimony, gold, cobalt, sodic sulphate, sulphate of barium (barytes), phosphorite (a valuable manure, a variety of apatite found in Caceres), alum, sulphur, kaolin, lignite, asphalt, besides a variety of building and ornamental stones

The total number of mines (including springs for the production of mineral waters) in operation in Spain in 1883 was 2620, and the total number of labourers employed in them in that year was 57,626 The working of the mines is carried on under state supervision For this purpose the whole kingdom, including the Balearic and Canary Islands, is divided into three sections, and each of these into four districts Each section is under the charge of an inspector general of the first class, and each of the districts under an inspector of the second class By the law of July 6, 1859, a large number of important mines, including all the salt-works and rock-salt mines, were reserved as state property, but financial necessities have compelled the Government to surrender one mine after another, so that at present the state possesses only the cinnabar mines and some salt-works Many of the mines have been granted to foreign (principally English) companies

Of the metallic ores produced in Spain, those of lead and mercury are the only ones which are chiefly reduced in the country Though the working of iron is an industry of old standing in Spain, and a primitive kind of forge takes its name from Catalonia (see IRON), the total production of iron, refined and unrefined, in Spain in 1883 was only 200,000 tons, and by far the greater part of the Spanish ore is exported, as will be seen by comparing Tables V and VI The production of iron in Spain is, however, rapidly and steadily increasing, the total amount in the first year of the decade ending in 1883 having been less than 60,000 tons During the same decade the amount of copper produced in the kingdom increased from about 5000 to 32,000 tons The amount of steel produced in the kingdom is quite insignificant (little more than 400 tons in 1883) The following table (VI) gives particulars regarding the export of the chief mineral products of Spain in 1883 —

Minerals	To United Kingdom	To France	Total export to all Countries
	Metric Tons	Metric Tons	Metric Tons
Iron ore	2,895 000	511,000	4,226,000 [3]
Argentiferous galena	2,400	2,000	13,000
Lead ore		1,400	2,500
Copper ore	555,000		565,000
Zinc ores—			
Calamine		20,000	30,000 [4]
Blende			15,000 [4]
Antimony ore	70		70
Manganese	3 300		4,500
Phosphorite	1,000		56,000 [5]

Wrought-iron and steel	7,440	68,708	186 510
Lead in tubes and other forms			546,425 [7]
Copper, brass, and bronze in plates, tubes, and other forms	171,403	187,844	385,551

Manufactures —At the census of 1877 only about 3 per cent of the classified population was returned as engaged in manufacturing industries The principal manufacture is that of cotton, and the following table, which shows the position of Spain relatively to the other countries of Europe with reference to this branch of manufacturing industry, will also serve to some extent as an index of the rank belonging to Spain in mechanical industries generally.— Manufactures

TABLE VII —*Average Import of Raw Cotton for Home Consumption in the Principal Countries of Europe during* 1879–1883

	Millions of lb		Millions of lb
United Kingdom	1460 8	Spain	100 3
Germany	336 9	Holland	94 8
France	309 6	Belgium	54 7
Russia	242 6	Switzerland	53 8
Austria Hungary	176 6	Sweden	21 6
Italy	116 0		

The average import per head of population during the same period was as follows —United Kingdom, 41 7 lb , Holland, 23 6 , Switzerland, 18 7 , Belgium, 9 9 , France, 8 2 , Germany, 8 2 , Spain, 6 0 , Austria-Hungary, 4 6 , Sweden, 4 6 , Italy, 4 0 , Russia, 2 9 It thus appears that Spain occupies the seventh place in the consumption of raw cotton, both in absolute amount and relatively to population In the five years 1874–78 the average import of raw cotton into Spain was 79,690,000 lb, so that the increase of the average in the succeeding period of five years amounted to 25 8 per cent Nevertheless the products of this branch of industry in the country do not yet suffice to meet the wants of the population There is every year a considerable import of cotton manufactures, while the export of this commodity is too trifling to be included in the list of chief exports The maritime provinces, being those most favourably situated for the import of coal, and, where necessary, of raw material, are the chief seats of Spanish manufactures, and the cotton industry is principally centred in Catalonia and, above all, in Barcelona and the surrounding district This region is indeed the only distinctively manufacturing portion of Spain, and in it also the manufactures of linen and woollen goods and of lace are mainly carried on Flax-spinning and the manufacture of linen goods are pursued to a considerable extent in Galicia and Asturias The silk industry, which is likewise of high importance, but inadequate to meet the home demand for silk fabrics, is chiefly centred in Valencia, next to which come Murcia and Seville Metal industries are chiefly carried on in the Basque Provinces, where various articles in iron and copper are made A royal factory for the making of artillery and other weapons of war exists at La Trubia, in Asturias Toledo is still noted, as it has been from the earliest times, for the excellence of its sword-blades The manufacture of leather, another Spanish industry of old renown, is still extensively carried on in Catalonia and elsewhere, but the making of *cordovan* has long ceased to be a specialty of Cordova, from which it takes its name Boots and shoes and other articles in leather form the only considerable export of manufactured goods Gloves are made in great quantity in Madrid, shoes in the Balearic Islands The paper industry is very flourishing, especially in Catalonia and Valencia Esparto is twisted into cords and ropes, and plaited into a variety of other articles, in Murcia and Alicante and elsewhere The refining of cane-sugar is largely carried on in Barcelona, Malaga, Almeria, and Granada, and

[1] A metric ton=1000 kilogrammes=2205 lbs , or 35 lbs less than a ton avoirdupois

[2] Exclusive of 100,000 tons produced in the state salt works of Torrevieja (Alicante)

[3] Of this total 478,000 tons were exported to Holland, 142,000 to Belgium, and 199,000 to the United States

[4] All the blende and one third of the calamine were exported to Belgium

[5] Chiefly to Portugal

[6] Of this total 158,760 lbs were exported to Belgium

[7] Chiefly to Cuba

the making of olive oil and brandy is general. So also is the making of charcoal, which in most parts of Spain takes the place of coal for all ordinary heating purposes, and even in some cases in mechanical industries. The large furnaces for the distillation of mercury at Almaden were at one time, if they are not still, heated solely with charcoal obtained from the *Cistus ladaniferus*. Among manufacturing industries of less importance are the making of porcelain (at the royal factory of Moncloa, near Madrid), glass and earthenware, soap, chocolate, and cork-stoppers. The manufacture of tobacco, which is a royal monopoly, is carried on at seven factories—at Seville, Madrid, Santander, Gijon, Coruña, Valencia, and Alicante, —that of Seville being the largest.

Foreign Commerce.—Possessing such varied resources as it does, and being peculiarly favourably situated for commerce, Spain might be expected to take a leading place among the trading communities of Europe. This it did at one time hold, when the treasure acquired by the discovery of America and the conquest of Mexico and Peru was squandered in the purchase of various commodities from England, the Netherlands, and other countries. This period of outward prosperity, however, was also that in which the seeds of decline were planted. The expulsion of the Moors from Granada was contemporaneous with the discovery of the New World. Hundreds of thousands of Moors were driven out from the country on subsequent occasions, and in the act Spain lost the best of her agriculturists and handicraftsmen. For the stay-at-home industry by which the resources of the land could be developed as they had been by the Moors the Spaniards of that day had no taste. Excited by the hope of rapidly-acquired wealth and the love of adventure, the more enterprising spirits embarked upon a career of discovery, and agriculture and manufacturing industry fell into contempt. The mercantile supremacy of the country was thus short-lived. Political causes supervened to hasten the country's decline, and it is only within recent times, since the introduction of railways, that the commerce of the country has begun to revive. The average value of the imports and exports combined during the period of ten years from 1875 to 1884 was equal to rather less than £2 per head,[1] as against about £18 per head during the same period in the United Kingdom; but even this state of matters shows a considerable advance compared with 1859, when the total value of the exports and imports was equal to only about £1, 12s. per head. The following table (VIII.) gives total value in round numbers of imports and exports, with percentages from and to Great Britain and France, at various dates from 1849 (the year after the opening of the first railway in Spain) to 1884:—

Years	Value of Imports	P. c. from Britain	P. c. from France	Value of Exports	P. c. to Britain	P. c. to France
1849	£6,360,000			£5,240,000		
1860	14,933,000	25	25	10,982,000	29	22
1865	16,262,000	26	34	12,864,000	29	27
1870	20,877,000	24	39	15,982,000	39	16
1875	22,812,000	34	26	18,081,000	34	16
1880	28,482,000	18	38	25,999,000	32	35
1881	26,023,000	21	32	26,836,000	33	38
1882	32,667,000	21	27	30,615,000	31	41
1883	35,738,000	21	26	28,779,000	25	42
1884	31,186,000	21	25	24,768,000	27	43

On the average of the five years 1879-83 the principal exports, in the order of their importance, were wine, metals and mineral ores, fruit, oil, and cork,—wine being by far the most valuable; the principal imports, in the order of their importance, raw cotton, brandy and spirits, sugar, machinery, tobacco, coal and coke, timber, cod-fish, iron (wrought and unwrought), hides and skins, chemical products, cocoa, cotton manufactures, and mineral oils. The large imports of cod-fish (from Norway and British North America) are due to the large consumption of fish, especially during Lent; the great demand for mineral oil as a source of light is a consequence of the dearness of coal. It is interesting to note the high place which cocoa takes among the imports. The average import of that commodity is nearly double that of coffee, and that of tea is quite insignificant (in 1884 only 155,777 lbs.).

The foreign commerce of Spain is chiefly carried on with the United Kingdom, France, Cuba, and the United States. In the ten years 1873-82 France, the United Kingdom, and the United States together (in the order named) furnished on an average rather more than 67 per cent. of the imports, and the United Kingdom, France, and Cuba (also in the order named) received on an average during the same period 75 per cent. of the exports. Next to the three countries mentioned, those which had the largest share in the import trade during the same period were Cuba, Portugal, and the Argentine Confederation, and in the export trade Portugal, the United States, and the Argentine Confederation. From the United Kingdom Spain received in 1884 chiefly coal and coke, iron and articles in iron (articles in wrought-iron and steel, however, in rather greater amount from Belgium), locomotives (also from Belgium), jute and jute yarn, hemp and flax yarn, sulphur (for use in the vineyards), and alkaline carbonates; from France, chiefly wool and woollen goods, silk and silk goods, and wheat flour; from the United States, petroleum, raw cotton, and tobacco (also from the Philippine Islands); from Cuba chiefly sugar and fine woods; from the Argentine Confederation chiefly untanned hides and skins and animal fats. Wheat was received chiefly from Russia, and spirits from Germany, which also supplied a large proportion of the sugar consumed in the country.

Of the principal export of Spain—wine—by far the greater proportion goes to France. In 1884 that country received four-fifths of the common wine, and the quantity is rapidly increasing. The wine classed as full bodied also went chiefly to France, but that entered under the head of sherry and similar wines was imported chiefly by the United Kingdom. The destination of the minerals is shown above (Table VI.). Oranges were sent mainly to the United Kingdom, France, the United States, and Germany; raisins chiefly to the United States and the United Kingdom; olive oil chiefly to Cuba, Denmark, and France, but in considerable quantity also to other countries; esparto grass almost entirely to England; cork and wool chiefly to Portugal and France; cattle chiefly to Portugal and England; raw silk mainly to France; and wheat flour and chickpease chiefly to the Spanish West Indies.

The foreign trade of the country is of course carried on mainly by sea. In 1884 more than 80 per cent. both of the imports and exports were transmarine, and of the land commerce by far the largest proportion is with or through France. The smallness of the trade with Portugal, which on an average furnished less than 1½ per cent. of the imports and received less than 5½ per cent. of the exports during 1873-82, is partly due no doubt to the similarity of the chief products of the two countries, but also to the defectiveness of the communications between the two countries, a circumstance largely accounted for by the physical conditions already alluded to. The introduction of railways has as yet only partially served to bring the countries into more intimate relations. On the first of January 1885 not a single line connected with the general system of Spanish railways entered Portugal north of the Tagus, though Lisbon was connected by rail both with Madrid by way of Caceres and with Valencia by way of Ciudad Real and Albacete. At the date mentioned, however, a railway intended to connect Salamanca with the mouth of the Mondego was in course of construction, and a branch from the Portuguese coast-line in the north was in process of being connected with the Spanish railway to Coruña, and by way of Leon with other northern seaports.

The foreign commerce of Spain is greatly hampered by the number and amount of the custom duties, which are imposed on all the principal articles both of export and import. On imports the duties vary from 6 to 28.33 per cent. of the value of the commodities, the highest duties being upon cotton yarn, sugar, and cocoa (to protect home or colonial industries). For protective reasons high import duties are levied also on iron manufactures, woollen manufactures, live animals, coffee, and wine. Export duties are levied mostly in proportion to quantity. In the case of sherry it amounts to 200 pesetas (£8) per hectolitre (22 gallons), full bodied wines pay 112 pesetas per hectolitre, and ordinary wines 33 pesetas per hectolitre. In the case of "the most favoured" nations slight reductions are made in the amount of the duties, and under a treaty which came into operation on the 15th of August 1886 Great Britain enjoys the benefit of the most favoured nation treatment in consideration of a reduction in the import duties levied at British ports on Spanish wines.

Shipping and Navigation.—Relatively to the extent of its coast-line and the number and excellence of its seaports (of which there are sixty on the Mediterranean coast, fifty-six on the Atlantic), the amount of shipping belonging to Spain is small. In 1884 the total register tonnage was 524,000 tons, not much more than that of Sweden at the same date, and only about half that of Italy. The number of vessels was 1803, including 301 steamers. Nearly half the transmarine imports (reckoned by value) and 58 per cent. of the transmarine exports were carried under a foreign flag. The following table (IX.) gives further particulars as to the shipping of 1884:— Shipping.

Flag	Metric Tons (in Thousands) of Cargo		Percentage of Total	
	Discharged	Loaded	Imports	Exports
National	623	766	22.6	13.0
British	1394	3866	50.5	65.7
Dutch	11	54	0.3	0.9
French	174	666	6.3	11.3
German	76	123	2.7	2.1
Greek	41	2	1.5	
Italian	131	165	4.7	2.8
Norwegian	121	67	4.3	1.1
Russian	60	27	2.1	0.4
Swedish	57	39	2.1	0.7
Total (under all flags)	2760	5880		

[1] An increase of the population since 1877 at the rate of .35 per cent. per annum allowed for in making the calculation.

The following table (X.) gives the number, &c., of ships entered and cleared with cargo at Spanish ports in 1884:—

Entered from	Under the Spanish Flag: No. of Vessels	Capacity in Tons	Metric Tons Discharged	Under Foreign Flags: No. of Vessels	Capacity in Tons	Metric Tons Discharged
Algeria	653	74,122	17,853	140	69 300	4 937
Belgium				298	191,122	54,057
Cuba	186	199,744	37 572	11	29 121	498
France	1,974	711 241	140 005	1 0[illegible]8	472 970	169 631
Norway	17	5 551	2,655	261	81,796	35,850
Philippine Islands	97	194,278	19,256			
United Kingdom	1,120	712,565	240,365	1,721	960,135	1,256,285
Total from all countries	5,652	2 376 861	623,156	5,470	2,694,876	2,137 222

Cleared for	Under the Spanish Flag: No. of Vessels	Capacity in Tons	Metric Tons Loaded	Under Foreign Flags: No. of Vessels	Capacity in Tons	Metric Tons Loaded
Algeria	536	76 585	13,476	36	49,128	621
Belgium	86	69 548	17,893	145	110,538	119,105
Cuba	433	612 268	97,563	7	14,854	171
France	2,347	1,126 607	226,713	1,855	936,247	695,408
Norway				73	28,524	24,167
Philippine Islands	94	243 245	8,549			
United Kingdom	907	638 518	200,570	3,790	2,988,857	3,132,671
Total for all countries	5,266	3,500,207	766,303	7,844	5,638,259	5,114,082

The total number of vessels entered with cargo under the national and foreign flags in 1884 was thus 11,122, and the total quantity of cargo discharged by them at Spanish ports 2 760,378 metric tons, the total number of vessels cleared with cargo 13,110, and the total quantity of cargo taken on board by them at Spanish ports 5,880,385 metric tons Of the total number of vessels entered with cargo 6768 were steamers, which discharged 2,052,937 tons of cargo, and 4354 were sailing vessels, which discharged 707,441 tons of cargo Of the number of vessels cleared with cargo 9506 were steamers, which took on board at Spanish ports 5,300 366 metric tons of cargo, and 3604 were sailing vessels, which took on board 580,019 metric tons of cargo

Roads *Communication*.—The communications in Spain have been greatly improved since the beginning of the present century In 1808 there were little more than 500 miles of carriage roads, but now there are over 28,000 At the end of 1882 14,600 miles were state roads, all well built and well maintained, and 3027 miles of state roads were in course of construction The aggregate length of the provincial roads then completed was 2714 miles, and that of the communal roads 10,760 miles In the mountainous districts, where there are only narrow paths, frequently rather steep, it is still not uncommon to meet long trains of mules

Railways Railways have made great advance since the middle of the century The oldest line is that from Barcelona to Mataro, 17½ miles, which was opened on the 28th of October 1848 Of late years railway construction has been going on pretty rapidly In 1880 the number of miles open for traffic was 4645, and in the four succeeding years it was 4800, 4867, 5118, and 5386 All the Spanish railways belong to private companies, but most of them have obtained subventions from the Government, to which most of the Spanish railways will revert at the end of a term of ninety-nine years In granting a concession for a new railway the regular practice is to give it to whatever company offers to construct it with the lowest subvention The total amount of the subventions for railway construction up to the end of 1884 was £25,676,690 For strategical reasons the Spanish gauge was made different from that of France

Post office. The postal and telegraphic systems have been placed on the same footing as in other civilized countries The total number of letters, post-cards, and samples (including official and international letters, &c.) that passed through the post office in 1882-83 was

Telegraphs 111 millions The length of state telegraphic lines on January 1, 1883 was 10,664 miles, and of wires 25,989 miles The number of messages in 1883 was 3,020,000, nearly 80,000 being transit messages and 654,000 from or to foreign countries

Army *Army and Navy*.—Military (or naval) service is obligatory on all Spaniards, but in certain cases recruits are allowed to buy themselves off According to the law of January 8, 1882, the period of service for all arms is twelve years, of which three years must be passed with the colours, three years in the active reserve, and six years in the second reserve The minister of war is empowered, however, on financial grounds to transfer troops serving with the colours to the active reserve before the period of three years' service has been fulfilled Liability to service begins with the first day of the calendar year in which the twentieth year is completed Persons holding a civil appointment or pursuing any handicraft independently are allowed to buy themselves off for 1500 pesetas (£60), and brothers are allowed to take each others' place in service, or to exchange the numbers that have fallen to them by lot in the raising of the recruits for the year For carrying out the law Spain is divided into fourteen military districts, the boundaries of which do not at all coincide with those of provinces

The actual strength of the regular army is fixed at about 94,000 men for the kingdom (including the Balearic and Canary Islands), but this number may be brought up to 400,000 in time of war The strength of the regular army in Cuba is about 22,500 men, in Porto Rico about 3200, and on the Philippine Islands about 8200 The active army is divided into 140 battalions, besides the same number of depot and reserve battalions, 24 cavalry regiments, and the same number of depot squadrons and reserve cavalry regiments, 9 regiments of field artillery, and 3 of mounted artillery, besides 6 reserve regiments of artillery, and 10 battalions of engineers There are also 13 battalions of fortress artillery

Navy The following statement shows the strength of the navy in 1885 —*First Class*—4 ironclad frigates (55 guns), 4 screw frigates (97 guns), 6 cruisers (48 guns), *Second Class*—5 frigates (104 guns), 3 cruisers, 12 corvettes and troopships (39 guns), *Third Class*—1 ironclad monitor (3 guns), 1 floating battery, 79 gunboats, transports, &c (124 guns)

There were at the same time building one ironclad of the first class, five cruisers of the second class, besides torpedo boats, tugs, and other vessels For the defence of the colonies, and more particularly those of the West Indies, there are thirty-five screw gunboats, all of the same size (about 5 feet draught), and each carrying a 100 pounder pivot gun at the bow

The navy is manned by conscription in the maritime districts In 1885 the number of seamen was about 14,000, that of marines about 7000

Religion *Religion*.—Roman Catholicism is the established religion, and the church and clergy are maintained by the state The immense majority of the people (in 1877 16,603,959 out of a total of 16,634,345) are professed adherents of this faith, so that, so far as numbers go, Spain is still the most "Catholic" country in the world, as it has long been styled According to Willkomm, however, religious indifferentism is now very general, not only among the educated but also among the lower classes, and of the bigotry and fanaticism which in former times led to the destruction of hundreds of thousands of victims at the hands of the Inquisition the only traces at the present day are to be found, says the same authority, in the provinces of Aragon, Navarre, and Estremadura, where the clergy still exercise a considerable influence over the lower orders By the constitution of 1876 non-Catholics are permitted to exercise their own forms of worship, but they must do so in private and without making any public announcement of their services At the census of 1877 the total number of Protestants was 6654, a number below that of those entered as rationalists (9645) There are nine archbishoprics (Toledo, Madrid, Burgos, Granada, Santiago, Saragossa, Seville, Tarragona, Valencia, and Valladolid) and forty-five bishoprics. The archbishop of Toledo is primate

Education *Education*.—By the law of July 17, 1857, primary education was declared compulsory on all children of school age (originally fixed at six to nine) and made free to the poor, but the results of the census of 1877, though showing an advance in elementary education as compared with previous years, makes it clear that this law is far from being efficiently carried out. At that date the total number who could both read and write was 4,071,823, equal to 24 48 per cent of the population, as against 19 97 per cent in 1860 The provinces in which the percentage of those able to read and write was greatest were Alava, Burgos, Pontevedra, Madrid, Santander, those in which it was least were the Canary Islands, Granada, Malaga, Almeria, Alicante, Castellon

There are ten universities—those of Madrid (founded in 1836 to replace the long celebrated university of Alcala), Barcelona, Granada, Salamanca, Seville, Valencia, Santiago, Saragossa, Valladolid, and Oviedo, that of Madrid is now the most celebrated and the best attended, while that of Salamanca, so renowned in the Middle Ages, is now in least repute

Administration *Political Administration*.—Spain is an hereditary monarchy, the constitution of which rests on the fundamental law of June 30, 1876 The sovereign becomes of age on completing his or her sixteenth year The sovereign is grand-master of the eight Spanish orders of knighthood, the principal of which is that of the Golden Fleece (Toison de Oro), founded in 1431 by Philip of Burgundy. The chain of this order surrounds the royal arms, in which are included, besides the arms of Castile, Leon, Granada, and the lilies of the royal house of Bourbon, the arms of Austria, Sicily, Savoy, Brabant, and others The national colours are red and yellow The flag is divided into three horizontal stripes—two red stripes, with a yellow one between bearing the royal arms.

The legislative authority is exercised by the sovereign in conjunction with the *cortes*, a body composed of two houses—a senate

and a chamber of deputies The senate is composed of members of three classes —(1) members by right of birth or office—princes, the wealthier nobles holding the rank of grandee (*grande*), a dignity conferred by the king either for life or as an hereditary honour, and the highest state officials, (2) members nominated by the king for life, and (3) members elected by the state corporations and by the most highly taxed subjects of the state for a period of five years The members belonging to the first two classes must not exceed 180 in number, and there may be the same number of members of the third class The chamber of deputies consists of members elected for five years, in the proportion of one deputy for every 50,000 of the population The electors must be twenty five years of age and must have paid land-tax of twenty five pesetas (£1) for one year, or an industrial tax of fifty pesetas for two years

The executive administration is entrusted to a responsible ministry (*consejo de ministros*), in which the presidency belongs either to one of the ministers or to a president without portfolio There are eight ministerial departments—the first secretaryship of state, to which belongs the management of foreign affairs, the secretaryships of grace and justice, finance, and the interior, the department for the promotion of material and intellectual interests (*secretaria de fomento*), and the secretaryships of war, marine, and the colonies

The civil administration is under the secretary for the interior In each province is a civil governor nominated by the crown, and the governor presides over a council, the members of which are elected by the representatives of each commune (*ayuntamiento*)

Justice *Law and Justice* —Spanish law is founded on the Roman law, the Gothic common law, and the national code proclaimed at the meeting of the cortes at Toro in 1501 (the *Leyes de Toro*) There is a court of first instance in each of the 501 *partidos judiciales* into which the kingdom is divided, and a court of second instance in each of 15 *audiencias territoriales* into which the *partidos judiciales* are grouped, and there sits at Madrid a supreme court modelled on the French *cour de cassation* The administration of justice is public Except in commercial cases the parties to a suit must always be represented by sworn counsel (*abogados fiscales*)

Finance *Finance* —The following statement (Table XI) shows the equivalent in English money of the budget estimates for the years noted, it should be explained, however, that these estimates have only a limited value, inasmuch as the public accounts of Spain have not been audited since 1870, and have not been passed by the cortes since 1867 —

Years	Revenue	Expenditure	Years	Revenue	Expenditure
1860-61	£18,923,440	£18,773,698	1881-82	£31,492,920	£32,584,598
1870-71	27,901,746	32,819,424	1882-83	31,259,769	31,573,083
1874-75	21,792,000	20,821,000	1883-84	32,095,075	32,053,999
1877-78	29,433,000	29,430,000	1884-85	31,444,682	31,003,969
1880-81	31,666,031	33,466,047	1885-86	34,900,575	35,885,369

The chief heads of revenue, according to the budget estimates of 1885-86, were—excise (including stamp duties and government monopolies), £10,534,480, direct taxes on land, trade, mines, &c, £10,393,920, taxes on Government salaries, registration, &c, £5,362,000, customs, £5,360,000 The chief items of expenditure were—the charges of the public debt, £10,966,937, the charges of the ministry of war, £6,050,944, those connected with the administration of state property, £5,748,593, the charges belonging to the *ministerio de fomento*, £4,177,983, those of grace and justice, £2,237,844, those of marine, £1,756,022

The expenses of quelling the insurrection in Cuba of 1868-78, and those subsequently arising out of a civil war in the Peninsula, raised the total amount of the Spanish debt on the 1st of January 1881 to about £512,000,000, but, as it was by that time manifest that Spain was unable to meet the obligations thus incurred, an arrangement was come to by which the capital and interest of the debt were reduced The bulk of the debt now bears interest at the rate of 4 per cent, and on the 1st of October 1884 the capital stood at 6356 million pesetas, or £254 250,000, and the total annual charge was 238 million pesetas, or £9,522,857 The principal items are the perpetual foreign debt, amounting in October 1884 to £78,840,000, a perpetual internal debt, amounting in October 1884 to £77,840,000, and a redeemable debt (internal and external) amounting to £70,480,000

Currency, Weights, and Measures —The French monetary system and the metric system of weights and measures have been introduced—the latter in 1859, the former in 1871 In the case of the weights and measures the French names also have been adopted, with only the necessary linguistic changes In the case of the currency the old Spanish name of *peseta* was retained for the unit (the franc), and the peseta is divided into 100 *centimos* According to the present value of the peseta, therefore, 25 pesetas may be taken as about equal to £1 Previously to the introduction of the French monetary system the peseta was the fifth part of a *peso duro*, which was equal to 20 *reales de vellon*, or rather more than a five franc piece The only paper money in Spain consists of the notes of the Banco de España

Bibliography —The most comprehensive work on the geography of Spain is the *Diccionario Geografico historico e Statistico de las Provincias de España* of Madoz, 16 vols, 1846-50 A more summary account is contained in the *Reseñas Geografica, Geologica, y Agricola de España*, by D Fr Coello, &c, Madrid, 1859, and in *Die Pyrenaische Halbinsel*, by Dr Moritz Willkomm, Leipsic, 3 vols, 1884-86 Numerous notices regarding the geography of Spain are to be found in the *Boletin de la Sociedad Geografica de Madrid* See also F Garrido *La España Contemporanea*, Barcelona, 2 vols, 1865-67 (the French edition, Brussels, 1862, is comparatively meagre), Davillier, *L'Espagne*, Paris, 1873 A J C Hare, *Wanderings in Spain*, A Gallenga, *Iberian Reminiscences*, London, 1883, Webster, *Spain*, London, 1882, Harrison, *Spain*, Boston, 1882, Higgin, *Commercial and Industrial Spain*, London, 1886, together with the guide-books of Ford (Murray) and O Shea (Black)

The botany of Spain is very fully treated in various works by Willkomm Besides the *Prodromus Floræ Hispanicæ*, Stuttgart, 3 vols 4to, 1861-80, the most important are *Illustrationes Floræ Hispaniæ*, Stuttgart 1881, &c, fol, and *Die Strand-und Steppengebiete der iber Halbinsel*, Leipsic, 1852, 8vo Of another flora by Don M Colmeiro, entitled *Enumeracion de las Plantas de la Peninsula Hispano Lusitana e Islas Baleares*, one volume has been published (Madrid, 1885) It is expected to be completed in 4 vols

There is no recent general work on the zoology of Spain

The geology of the Iberian Peninsula is treated in a series of articles, illustrated by several maps, by D Federico de Botella, in the above-mentioned *Boletin*, vol ii, 1877 See also Macpherson *Succession Estratigrafica de los Terrenos Arcaicos de España*, W K Sullivan, *Notes on the Geology and Mineralogy of the Spanish Provinces of Santander and Madrid* The geological maps of Spain already completed are those of De Verneuil and Collomb, Paris, 1864, 2d ed (now out of print) 1868, and De Botella y de Hornos, Madrid, 1879 A geological survey of the provinces of Spain is now in progress, and on the conclusion of the survey a map will be published in sixteen sheets on the scale of 1 400,000

Among the more important annual or periodical official statistical publications are the *Estadistica General del Comercio Exterior de España*, *Boletin Mensual de Estadistica Demografico Sanitaria*, *Situacion de los Ferrocarriles*, and *Estadistica Minera de España*

The best topographical map of Spain is that of C Vogel, in four sheets, in Stieler's *Hand Atlas*, on the scale of 1 1,500,000 Among other maps that may be referred to are that of D Fr Coello, scale 1 1,000,000, Madrid, 1861, and the *Mapa Itinerario Militar de España Formado por el Cuerpo de Estado Mayor del Ejercito en 1865*, scale 1 500,000 An excellent map, on the scale of 1 50,000, indicating the elevations by means of contour lines at intervals of 20 metres, and by figures for particular spots (the elevations reduced to the mean level of the Mediterranean at the port of Alicante), and distinguishing cultivated and uncultivated ground, and in the former distinguishing huertas, gardens, oliveyards, vineyards, orangeries, &c, where they exceed an area of 10 hectares, is now being published by the Instituto Geografico y Estadistico de Madrid Of this map, however, only about 20 out of 1080 sheets have as yet been issued Among those which have already appeared is that containing Madrid (G G C)

PART II —HISTORY.

SECTION I —ANCIENT HISTORY

Plate VII Hispania was the name by which the Romans called the great peninsula made up of Spain and Portugal, but we know nothing certain as to the origin of the name, or whether it was in general use among the ancient inhabitants of the country [1]

To the Greeks Spain, or rather its coast-line on the Mediterranean, was known vaguely as Iberia, a name we meet with in Herodotus (i. 163) in connexion with the Phœnician Tartessus, which is generally understood to have been the country about the mouth of the Guadalquivir and to be the Tarshish of Scripture It was the Phocæans, a branch of the Ionian Greeks settled in Asia Minor, who according to Herodotus first opened up to the Greek world this remote region of the extreme West, which had hitherto been a land of mystery and enchantment, imagined to be the home of the setting sun, and known only by the reports of adventurous Phœnician mariners The hero-god Hercules, it was fabled, had left traces of his presence and mighty working here, and the twin rocks at the entrance of the Mediterranean were called by his name, "the Pillars of Hercules,"—the "world's end" to the Greeks, nothing but the all-encircling ocean-river lying beyond The Greeks seem to have planted no colonies in Spain, with the exception of Emporium, on the coast just under the eastern spur of the Pyrenees, founded probably from Massilia (Marseilles) by the Phocæans, and perhaps of Saguntum In fact they had but very hazy notions about the country, and Iberia, as they called it, was to them little more than a name for an indefinite extent of territory in the Far West, in the occupation of

[1] Humboldt derives it from the Basque *espana* (border), as signifying the part of Europe bordering on the ocean, but his conjecture seems strained and fanciful

barbarous Celts and Iberians, with some Phœnician settlements for the purposes of trade on its southern coasts Several of these places were just known to them by name, but even of Gades, rich and populous as it seems to have been in quite early days, nothing but vague hearsay had reached them, and Herodotus, who mentions it as Gadeira (iv 8), merely defines its position as "on the ocean outside of (beyond) the Pillars of Hercules" Tarraco, one of the oldest and most important of the cities of Spain, and one of which we hear continually in the subsequent history of the country, was also in all probability a Phœnician colony There are still here remains of very ancient walls, possibly Phœnician work Gades, Tartessus, Tarraco, all seem to have been of Phœnician origin[1] and of unknown antiquity, and they were flourishing places in the 7th century B C, when the Greeks first made a slight acquaintance with them,—an acquaintance, however, which they did not follow up The result is that we really know nothing about Spain till the first war between Rome and Carthage (264–241 B C) There was indeed, in the 4th century B C, an embassy to Alexander the Great from the remote West, of Gauls and Iberians, and from that time learned Greeks began to discuss the geography of Spain But again the country drops out of sight till the 3d century B C, when we find a close connexion established between it and Carthage, which, being itself a Phœnician colony, would feel itself almost at home on the southern shores of Spain According to Polybius, Carthage (before the First Punic War) had acquired at least something like a protectorate over the Iberian tribes as far as the Pyrenees, the then recognized boundary between the Iberians and Celts,—between, in fact, Spain and Gaul Spanish troops served as volunteers in Carthaginian armies There must have been a good deal of Phœnician blood in the south of Spain for many centuries, and this no doubt prepared the way for Carthaginian ascendency in the country Not, however, till after the First Punic War and the loss of Sicily was there anything that could be called a Carthaginian empire in Spain It was in 237 B C that Hamilcar Barca, the father of Hannibal, crossed the Straits of Gibraltar and set foot in Spain, not, however, with any commission from the home Government at Carthage, but with the deliberately formed design of making the country, with its warlike population and great mineral wealth, into a Carthaginian province, and ultimately into a basis of operations in a future war with Rome (see HAMILCAR, HASDRUBAL, HANNIBAL) There were rich mines in the mountains, which had drawn the Phœnicians some way into the interior, and among the native tribes there were the elements of a brave and hardy soldiery A good army might very well be organized and paid out of the resources of Spain All this Hamilcar clearly saw, and in the true spirit of a statesman he set himself to the work, not merely of subjugating the country, but of making the Spaniards into loyal subjects of Carthage He encouraged marriages between his officers and soldiers and the native women his own son Hannibal married a Spanish woman He showed them how to work their gold and silver mines to the best advantage, in every way, in short, he made them feel that he was their friend The great work of which he had laid the foundation was carried on after his death in 228 by his son-in-law Hasdrubal, under whom New Carthage, with its fine harbour, founded probably by Hamilcar, became the capital of the country It would seem that by this time the Carthaginian empire in Spain was as firmly established over the southern half of the country as the fickle and uncertain temper of the native tribes would admit The Spaniard of that day, as indeed more or less throughout his whole history, was particularly amenable to personal influence, and an Hamilcar or a Hannibal could sway him as he pleased From 228 to 221 Hasdrubal was extending and strengthening the Carthaginian rule in Spain, while the Romans were fighting in Cisalpine Gaul One precaution, indeed, they had taken, an understanding with Hasdrubal, which might be regarded as a treaty, that the Carthaginian conquests were not to be pushed east of the Ebro West of that river there was one town, Saguntum, a Greek colony, in alliance with Rome, this Hasdrubal had spared His successor, Hannibal, after two years' continuous fighting, which resulted in the submission of hitherto unconquered tribes and the undisputed supremacy of Carthage throughout almost all Spain, attacked and took the place in 218

This was the beginning of the Second Punic War Spain was now for the first time entered by Roman armies, under the command of the two Scipios,—the brothers Cneius and Publius Six years of hard fighting ended in the defeat and death of these two brave men, but in 210 the son of Publius, the elder Africanus, struck a decisive blow at the Carthaginian power in Spain by the sudden capture of New Carthage The war, however, still dragged on till 205, in which year it may be said that Spain, or at least that part of it which had been under Carthage, was fairly conquered by the arms of Rome Andalusia, Granada, Murcia, Valencia, Catalonia, Aragon, may be said to have become Roman territory Rome had now to deal simply with the native Spaniards, without the fear of any foreign interference Hence from 205 the reduction of the country into a Roman province was only a matter of time It proved, however, to be a tedious and troublesome work, and more than once Rome's hold on Spain was seriously imperilled An oppressive governor, or a governor without tact and sympathy, was sure to unsettle the restless and impressionable tribes, and to stir up all manner of dangerous jealousies and heart-burnings The Scipios, the elder Africanus especially, knew how to manage the people, and yet even in 205, the year of those brilliant successes of Africanus, there was a great rising of several of the tribes, headed by a local chieftain, against the dominion of Rome It was quelled after a sharp engagement, there was a general submission on the part of the Spaniards, and many of them became Roman tributaries It was some time, however, before the country, or even the southern half of it, was really subdued into complete peace and order The mountains and the forests were a formidable obstacle to the Roman legions, and favoured that guerilla warfare which makes conquest slow and laborious For a long period many of the tribes were rather the allies and dependants of Rome than her subjects, and might at any moment be roused into war In fact, Rome's dominion west of the Ebro—Further Spain (Hispania Ulterior), as the province was called—must for very many years have been little more than nominal Rome's policy was to keep the native tribes disunited, and to have as many of them as possible under a friendly protectorate There seem to have been wide differences between these tribes,—some, especially those in the interior and in the north, being fierce and utterly barbarous, and others in the south and south-west comparatively mild and civilized The Celtiberi, in the interior, were a group of warlike tribes, and were always uncertain and intractable At one time they would fight for Rome, at another they would serve as mercenaries for Rome's bitter foe, the Carthaginian Continually were they breaking out into revolt and defying the arms of Rome. The "Celtiberian War" often figures in the pages of Roman histories, and it generally meant a war

Roman conquests

[1] For the Phœnician colonization of Spain, see PHŒNICIA, vol xviii p 806

involving the greater part of Spain. In 195 the elder

Cato

Cato had to put down a rising in the country, in which the Celtiberi took the lead, but he offered them favourable terms, and showed himself particularly anxious to conciliate them. His Spanish campaigns were so far a success as to establish the Roman power east of the Ebro, and along with peace and order came better administration and a development of the resources of the district now known as Hither Spain (Hispania Citerior). Cato is said to have disarmed the inhabitants of this part of Spain, and to have even compelled the Spaniards, from the Pyrenees to the Guadalquivir, to pull down their fortifications, but still the smouldering fires of rebellion were not trampled out. Some few years afterwards, in 179 and 178, we find

Gracchus

the father of the famous Gracchi governor of Hither Spain, and fighting with the troublesome Celtiberi, winning victories over them, capturing one hundred and three of their towns, and then securing his conquests by showing himself as great in peace as he had been in war. He seems to have anticipated in Spain the work attempted by his sons in Italy, making grants of land on favourable conditions to the poorer natives. Much must have been accomplished by Gracchus towards producing contentment with the Roman rule, but in the west, in the valleys of the Douro and the Tagus, and in the region known as Lusitania, answering to Portugal, there seems to have been almost incessant fighting, and what one general won another general often lost.

Mummius

Under Mummius, a governor of Further Spain (154),—the Mummius who in 146 took and sacked Corinth,—the Romans suffered a disastrous defeat from the Lusitanians, of which the Celtiberi took prompt advantage, and there was another Roman defeat, with a massacre of Roman citizens in one of the towns of the interior. These losses were avenged

Marcellus

in 152 by Claudius Marcellus, grandson of Hannibal's illustrious antagonist, during whose command in Spain Corduba is said to have been established as a Roman colony. Marcellus was too humane and considerate to the Spaniards to suit the ideas of the Roman senate, which we may well suppose to have been greatly provoked by the trouble which Spain had given them. The new governors, Lucius Lucullus and Servius Galba, by a combination of perfidy and extortion, drove the country into a most formidable revolt, with which the Romans, whose hands were tied by the Third Punic War, could

Viriathus

not for some time effectually deal. A guerilla chief of Lusitania (which had been specially ill-treated by the Romans), Viriathus, headed the revolt, and from 147 to 140 army after army of the Romans was cut to pieces; the formidable Celtiberi had joined his standard, and Spain seemed well-nigh lost to Rome. A treaty was even extorted by Viriathus from one of the Roman commanders, declaring the independence of the Lusitanians, and it is said to have been acknowledged and accepted by the senate. The brave man, however, could not hold together his fickle Spanish levies, and he fell at last by native treachery, encouraged by or at least connived at by the

Siege of Numantia

Romans. The Celtiberi, however, were still in arms; the strong city of Numantia, the capital of the Arevaci, the most powerful Celtiberian tribe, witnessed more than once the defeat of a Roman consul before its walls (141 to 140). The besieging army became despondent and demoralized, and its commander, supplies failing him, had to retire, leaving his sick and wounded behind him. It was humiliation indeed for Rome to be thus baffled by a half-barbarous country-town of no great size, in the interior of Spain. She now sent her best general, the

Scipio

younger Scipio, into the country, and in 133 the capture and destruction of Numantia gave Rome a hold over the inland district of Spain which she had never before had (see SCIPIO). The province of Hither Spain was rendered safe from Celtiberian incursions. Shortly afterwards Lusitania and its towns, after some obstinate fighting, were reduced to submission by the consul Junius Brutus, and thus Spain, with the exception of its northern coasts, the home of its most barbarous tribes, was nominally Roman territory.

Spain under Roman rule

There must have been by this time a considerable mixture of Roman blood with the native population; there were several towns—Carteia, Valentia, Tarraco especially among them—with a Latin municipal constitution and with a number of Latin-speaking people. The growth of Roman civilization had fairly begun, and it was promoted by a commission sent out by the senate after Scipio's victories. Piracy in the Mediterranean was checked in the interest of native Spanish commerce, and the Roman administration generally favoured the development of the country's prosperity. The extensive mountain districts were still the shelter of banditti, but, on the whole, order was well maintained, and Spain from this time flourished under Roman rule. It abounded in flocks and herds, and had a number of thriving populous towns, particularly on its Mediterranean shores. It seems, too, that it was never oppressed and impoverished by some of those forms of tribute,—such as the exaction of a tenth of the produce,—under which many of Rome's provincials smarted. Fixed money payments, and military service in the Roman armies, were the chief burdens which the conquered Spaniards had to bear. Rome on the whole, by comparison, dealt tenderly with them. Several of their towns had the privilege of coining the silver money of Rome; and the flourishing cities along the Mediterranean coast, which were so many centres of civilization to the adjacent districts, were treated rather as allies than as subjects. In these parts the Romanizing process went on rapidly and under favourable conditions, while the west and the north and a great portion of the interior remained barbarous, and Roman merely in name. In 105 it seemed possible that the Romans might be utterly swept out of the country; in that year a great wave of invasion passed over the inland regions from the Cimbri, who had destroyed two Roman consular armies on the Rhone. Spain to a great extent was cruelly ravaged, and Rome was too seriously menaced by the barbarians nearer home to be able to protect her. The country was saved by the brave Celtiberi, whose determined resistance forced the Cimbri back upon Gaul.

Again in 97 and 96 we hear of a rising of these same Celtiberians against Rome, and of campaigns in the interior, in which for the first time we meet the name of the famous Sertorius, a name almost as conspicuous in

Sertorius

ancient Spanish history as that of Hamilcar or Hannibal. For the remarkable episode of the eight years' wars of Sertorius in Spain against the generals of Sulla and against the great Pompey, and his almost successful attempt to render the country independent of the home Government at Rome, we must refer the reader to the article SERTORIUS. It was to his skill in winning the hearts of the Spaniards, more even than to his very considerable military ability, that he owed his successes. Rome was financially most grievously embarrassed by this tedious and difficult war, and Spain, with its Roman civilization and its Latinized towns on the Mediterranean, suffered severely. By the year 71 the country had

Pompey

been reconquered by Pompey for Rome, and the two provinces of Hither and Further Spain were reorganized under a somewhat more stringent rule, the tribute in some districts of the latter province being raised, and some of the towns in both losing their municipal independence. In 61 the great Cæsar was governor of

Cæsar.

Further Spain, and carried the arms of Rome into the

imperfectly conquered regions of the west and north-west, the country of the Lusitanians and of the Gallæci, and with a fleet from Gades is said to have occupied a point in the north-west answering to Coruña. But he was too short a time in Spain to reduce these barbarous regions to permanent subjection, and the work still remained to be accomplished. In the civil war with Pompey in 49 he was in Hither Spain, winning decisive victories over Pompey's generals, Afranius and Petreius. Once more, in 45, he had to enter Further Spain at the head of an army, and to defeat his rival's sons at Munda, somewhere probably in the neighbourhood of Cordova, a victory which made him undisputed master of the Roman world.

The north unconquered.

Spain, however, the northern part at least, was not thoroughly subdued—"pacified," in Roman phrase,—till the reign of Augustus, whose ambition it was to advance the boundaries of empire to the ocean. In the north was a wild and warlike highland population, a collection of tribes known as the Astures in the north-west, and their neighbours the Cantabri to the east, between a mountain range and the coast, "the last," as Gibbon says (*Decline and Fall*, ch. 1), "to submit to the arms of Rome and the first to throw off the yoke of the Arabs." Cæsar's flying visit in 61 had done something to cow these tribes but ever and again they would assert their independence.

Augustus.

In 27 the emperor Augustus himself penetrated their strongholds, and he passed two years in Spain; decisive victories were won over the northern tribes, and their towns and villages were converted into military posts in the occupation of the legionary veterans. Such was the origin of Saragossa, a modern survival of the name of Cæsar Augusta then given to an old town on the Ebro, henceforth an important Roman centre in Spain. The successes of Augustus were commemorated by the same title bestowed on other ancient Spanish towns, Bracara Augusta (Braga) in the north-west, Asturica Augusta (Astorga) still further north, Emerita[1] Augusta (Merida) on the Guadiana, which became a Roman city of the first class,—"the Rome of Spain," as it has been called,—and Pax Augusta, perhaps the modern Badajoz. The work of consolidating the Roman dominion in Spain was completed in 19 by his friend and minister, Marcus Agrippa, and now at last the "Cantaber non ante domabilis," as Horace has it, acknowledged Rome's supremacy.

Roman conquest complete.

Spain was fairly conquered; the warlike peoples of the north were cowed and broken; the south was thoroughly Romanized, the population having adopted Latin manners and the Latin tongue. Some of the best specimens of Roman architecture, some of the finest Roman coins, have been discovered in the cities of Spain, which from the time of Augustus became rapidly prosperous, and were famous for their schools and their scholars. Spain, in fact, was more completely Roman than any province beyond the limits of Italy. The country which had hitherto harassed Rome with incessant risings and insurrections was at last peaceful and contented, a happy land which for the next 400 years may be said to have had at least no military history.

Three Roman provinces.

Under Augustus the old political constitution into two provinces, Further and Hither Spain, of which the Ebro had been the boundary, was set aside, and exchanged for a division into the three provinces of Lusitania, Bætica, and Tarraconensis, sometimes spoken of as the "Three Spains." Of these Bætica, so called from the Bætis (the Guadalquivir), and answering nearly to Andalusia inclusive of Granada, was the smallest; Tarraconensis, which embraced Hither Spain and the interior and all the north, was much the largest. Lusitania corresponds to modern Portugal. The centres of administration were—for Tarraconensis, Tarraco; for Bætica, Corduba; for Lusitania, Emerita Augusta. We may see, in part, on what principles this division of the country was adopted. Lusitania and Bætica had tolerably distinct features, the latter having been from the earliest times the most civilized and the most tractable district of Spain. North of the Tagus came a much wilder region, the home of excitable and warlike tribes; this in great part, so as to include the country of the Celtiberi, was thrown into Tarraconensis, which, and also Lusitania, were under the empire "Cæsar's provinces," the governors of them being nominated by the emperor. The smaller and quieter province of Bætica was a "senate's province", and its finances were under the charge of the old republican official known as a "quæstor." The governor of Tarraconensis seems to have held decidedly the first position in the country; he had as a matter of course the greater part of the army under his command, and he was usually, it may be presumed, an ex-consul. The governorship, indeed, of this province must have been one of the best appointments in the emperor's' gift.

Spain under the empire.

Under the empire Spain was divided for the general purposes included under the head of local administration into fourteen "conventus," that is, provincial parliaments or assemblies made up of a union or combination of so many communities or townships. The town or city which was the centre of each "conventus" was the place where justice was administered to the inhabitants of the district and would, so far, answer to our assize town. In Tarraconensis there were seven of these "conventus,"—Tarraco, New Carthage, and Cæsar Augusta being the chief; in Bætica, four,—Gades and Corduba being of the number; in Lusitania, the least populous and civilized district, three—Emerita Augusta the principal, Pax Julia, perhaps the modern Beja, and Scalabis not far from the mouth of the Tagus. Pliny (the elder), to whom we are indebted for these details, enumerates 360 cities in Spain in the time of Vespasian. These included every variety of township,—the "colonia" which originated in a camp or a settlement granted to old soldiers, the town whose inhabitants had all been made Roman citizens in the fullest sense ("municipium" in Roman phrase, under the empire), the town that had the inferior franchise ("jus Latii"), the "free town," which might at any time have its freedom taken from it, and the "tributary" town ("civitas stipendiaria"). Spain presented types of all these various communities till Vespasian, it is said, gave them all the "jus Latii," which opened an easy door for the provincials to the full privileges of citizenship. A native-born Spaniard might now rise to the imperial dignity, as Trajan did; and the Spaniards generally must have felt themselves to all intents and purposes Romans.

Rearrangement of provinces.

The provincial constitution of Spain was revised and modified to some extent in the 2d century in the time, it would seem, of the Antonines and Hadrian. The vast and unwieldy province of Tarraconensis was subdivided, and the divisions distinguished as Gallæcia (the north-west), Carthaginiensis with New Carthage for its capital, Tarraconensis (the old name being then still retained for one division) with Cæsar Augusta for its capital, and the Balearic Isles, which had always been regarded as Spanish territory. Constantine accepted this arrangement, including, however, in it a strip of the western coast of Africa, part of the old Mauritania, which, from an ancient Moorish town, Tinge (Tangier), took the name of Tingitana among the later Roman provinces.

Frankish invasion.

Spain in 256 A.D. was invaded and ravaged by the Franks; Tarraco was almost destroyed, and several flourishing towns reduced to mere villages. It was, how-

[1] Emerita, from "emeriti," soldiers whose term of service had expired,—in fact, "veterans from the legions."

ever, but a passing storm,—the only interruption, in fact, to the peace and prosperity of the country during 400 years With the departure of the Franks Spain soon recovered herself, and when we next hear of her early in the 5th century we find commerce and civilization well established, and cities ranking among the finest and richest in the Roman world In 409, however, the year of the sack of Rome under Alaric, a tide of barbarism swept over the country, Suevi, Alani, Vandals "ravaged," says a writer of the time, quoted by Gibbon (ch 31), "with equal fury the cities and the open country" Spain, long so quiet and prosperous, was brought down to the lowest depth of misery At this point the precise order of events is not quite clearly ascertainable It seems that in 414 or 415 a Visigothic host entered Spain under their king, Ataulphus, Alaric's successor by election, who had married Placidia, the sister of Honorius, emperor of the West, son of the great Theodosius Ataulphus was now Rome's ally, and fought as her champion in Spain against Suevi and Vandals A new era seemed to have opened, and we may see in this alliance a prophecy of the ultimate fusion of Latin and German peoples,—the beginnings, in fact, of the modern world To Ataulphus, who was murdered at his new capital Barcelona, succeeded after a brief interval in 415 Walia, a warlike and ambitious chief, who may be said to have established the Visigothic or West-Gothic kingdom in Spain on the ruins of the old Roman province Walia concluded a treaty with the emperor Honorius, and, putting himself at the head of his brave Goths, in a three years' war he destroyed or drove into remote corners the barbarous hordes of Vandals, Alani, and Suevi that had settled down in the country Spain, thus reconquered, was nominally subject to Rome, but soon became really independent and began to be the seat of a Christian civilization

Inroad of barbarians

Section II.—Spain under the West-Goths

The West-Gothic or Visigothic kingdom in Spain, founded by Walia, lasted for nearly three centuries, from 418 to 711, when it fell before the Arab or Saracen invasion Toulouse was its headquarters, here was held the court of the West-Gothic kings, while Toledo became the centre of administration for Spain The relations of the West-Goths with Rome varied from time to time sometimes they were her friendly allies, sometimes, nominally at least, her dependants, sometimes they rose in revolt and were her open enemies Walia, after his victories in Spain, professed to restore the country as once more a Roman province to the rule of the emperor Honorius, and again we hear of the oppressions of imperial officers and functionaries, which seem to have been even more intolerable to the Spaniards than the strifes and wars of Vandals, Alani, and Suevi Nor were these troubles finally ended, Walia had by no means thoroughly consolidated his conquests, and the West-Gothic kingdom in Spain cannot be said to have been firmly established till the 6th century In northern Spain, in Galicia more especially, the Vandals and Suevi still had settlements, and were quarrelsome neighbours. In 428 they routed an allied army of Romans and Goths, and overran the southern districts, plundering some of the chief cities on the coast before they quitted the country for Africa under their king, the famous and savage Genseric The Suevi yet remained, but at the solicitation of the Romanized Spanish provincials of the southern cities, who felt themselves threatened with utter extinction by these barbarians, Rome offered its intervention, which was effectually carried out by the king of the West-Goths, Theodoric II, grandson of Alaric Crossing the Pyrenees in 456, as Rome's representative and ally, Theodoric crushed the Suevi by a decisive victory in the north-west of Spain, near Astorga It would seem that from this time the Suevic power was confined within the limits of Galicia, which became in fact a mere dependency of the West-Gothic kingdom Theodoric's victories, so far from strengthening Rome's hold on Spain, greatly weakened it, and this was what he himself really intended He did not even make a pretence of restoring the country to the imperial rule His brother and successor Euric[1] (466–485) persistently defied the empire, completing Theodoric's work, and establishing by further successes in Spain, carried into its remotest western districts, the West-Gothic kingdom in that country in full and avowed independence Euric was something more than a successful warrior he aspired to be a legislator, and he had the "customs of the Goths" recorded in writing and embodied in a code The work was continued by his successor Alaric II in the beginning of the 6th century, under the superintendence of civil and ecclesiastical lawyers, and it was based mainly on what was known as the Theodosian code (see BREVIARIUM ALARICANUM) The result was that a thoroughly Roman character was impressed on the West Gothic legislation, and that Roman institutions, ideas, and manners long survived in Spain With the conversion of the West-Goths from Arianism to the orthodox faith in the latter part of the 6th century, under their king Recared (586–589), came in new influences and a great accession of power to the ecclesiastics Recared was the first Catholic king of Spain With the zeal of a convert he set himself to root out Arianism, burning Arian books of theology and frightening his Arian bishops into the profession of the Catholic belief He seems to have been thoroughly successful, and richly endowed churches and monasteries grew up in every part of Spain. Pope Gregory the Great acknowledged the good work of Recared by a gift of sacred relics Unhappily the seeds of bigotry and religious intolerance had been sown, and with the beginning of the 7th century came a savage persecution of the Jews, multitudes of whom had long been settled in Spain and had thriven, as elsewhere, by trade and industry The Jew up to this time seems to have found in Spain a particularly safe and comfortable home Now, at the instance of a West Gothic king, he was so cruelly[2] oppressed and persecuted that even the Catholic clergy interposed to some extent on his behalf A decree for the expulsion of the entire Jewish community was promulgated on one occasion with the sanction of the council of Toledo, but the Jew still held his ground in Spain and prospered and grew rich, and his presence in the country contributed to the rapid spread of Arab conquest in the next century

Walia · *Theodoric.* · *Euric* · *Recared* · *The Jews in Spain*

Among the most conspicuous features of the West-Gothic kingdom in Spain we may note elective[3] monarchy, the great and indeed overshadowing power of the church, an aristocracy which had in its hands a very large part of the administration, a uniform code of laws for all Spaniards, with both a distinctly Roman and ecclesiastical impress on it The church on the whole seems to have been the guiding spirit, and the Spanish bishops and clergy were held in high esteem for their learning and virtue It was they who mainly inspired the legislation of the great national councils of Toledo, which to the West-Goths of Spain were what the Witenagemot was to our Saxon ancestors The church was the centre round which the whole of society moved In this fact we see foreshadowed much of the future of Spanish history, the supremacy of ecclesiastics, the extraordinary powers of the Inquisition It had from the first its evil

Features of West Gothic rule

[3] Limited, however, to pure Gothic blood

side in tendencies to bigotry and persecution, but it was at the same time the means of giving Spain laws very far above the average ideas of a barbarous people,—laws indeed which in many respects were rational, humane, enlightened, often combining the wisdom of old Rome with the kindly spirit of Christianity. The West-Gothic code recognized the equality of all men in the eye of the law; such barbarisms as the assessment of a man's value according to his rank and position, or judicial combat or trial by ordeal, find no place in it. It had certainly great merits; its weakness seems to have been in leaving too much scope on one side to the king, on the other to the clergy. Between the royal and the ecclesiastical powers individual freedom was liable to disappear. There was a danger, too, of human thought and speculation being wholly absorbed into theology. In anything like general literature Spain seems to have been decidedly poor during this period, while among her neighbours in the south of Gaul Greek philosophy was a fashionable study, testifying to the presence of considerable intellectual activity. Spain under its West Gothic kings and its Catholic clergy may have been a fairly well governed country, but long before the end came there must have been languor and decay amongst its people. After the conquest of Africa by Belisarius for the emperor Justinian, it seemed possible that the country might be once again annexed to the empire as a province; and an unsuccessful candidate for the throne,—which, it will be remembered, was elective,—went so far as to conclude a treaty of alliance, and actually to cede to the troops of the empire several towns on the Mediterranean coast. That a Gothic king should condescend to ask support from such a quarter, and allow himself to be spoken of as in any sense the empire's vassal, marks a very decided decline in the old independent spirit of the nation. We may certainly assume that repeated disputes as to the royal succession had undermined its power for resistance, and the numerous and not very well affected Jewish colony in their midst must have been a permanent source of danger. By the end of the 7th century northern Africa to the Straits of Gibraltar had passed wholly under Saracenic dominion. The struggle had been long and hard, and the West-Gothic kings, who had recovered the towns on the southern coasts, and even made some small conquests on the African shores, had done something to prolong it; but in 710 a little band of Saracens landed unopposed at Gibraltar, returned in safety, and urged their brethren at once to cross the straits and take possession of the country. In the following year (711) Tárik, at the head of about 5000 Saracen volunteers, entered Spain. A great Gothic army under Roderick, "the last of the Goths," was routed in the neighbourhood of Xeres on the Guadalete, and the Arab or Saracenic conquest of Spain, with the exception of the mountainous districts of the north, was accomplished with amazing ease and rapidity. Anything like a vigorous national resistance seems to have been too much for the Spaniards, enervated as they were by long familiarity with Roman civilization.[1] (W. J. B.)

Decline and fall of the West-Gothic power

SECTION III.—MEDIÆVAL HISTORY.

The Arab invasion

The Arab invasion of Spain had been intended by Músá, the governor of Africa, to be merely a plundering raid (compare MOHAMMEDANISM, vol. xvi. p. 573). A single unexpected success turned it into a conquest. Tárik had already made himself master of Cordova and Toledo when Músá arrived from Africa and rewarded his too successful lieutenant by consigning him to prison. But his military ability was too valuable to be dispensed with, and he was speedily released to aid in completing the conquest. Within four years the whole Peninsula, except the mountainous districts in the north, had submitted to the invaders. It was now Músá's turn to suffer from the jealousy of his superior. Recalled to Damascus by Walíd, he arrived just after the caliph's death, and at once fell under the displeasure of his successor Suleiman. His sons, who had been left to rule in Spain, were involved in his disgrace, and the father died broken-hearted on a pilgrimage to Mecca.

Causes of its success.

Few things in history are more remarkable than the ease with which Spain, a country naturally fitted for defence, was subdued by a mere handful of invaders. The usual causes assigned are the misgovernment of the Visigoths, the excessive influence enjoyed by the clerical caste, internal factions and jealousies, and the discontent of numerous classes, and especially of the Jews. All of these doubtless co-operated to facilitate the conquest and to weaken the power of resistance, but the real cause is to be sought in the fact that the Visigoths had never really amalgamated with the conquered population. The mass of the inhabitants regarded their rulers as aliens, and had no reason to resent a change of masters. This feeling was strengthened by the conduct of their new conquerors. The Arab invasion undoubtedly brought with it considerable bloodshed and destruction of property, but it was merciful when compared with the previous inroads of the German tribes, and in the end it proved a blessing rather than a curse to the country. To all who submitted the Arabs left their laws and customs, and allowed them to be administered by their own officials. The cultivation of the fields was left to the natives, and the overthrow of the privileged classes gave rise to a system of small holdings or properties, which was one of the causes of the flourishing condition of agriculture under Arab rule. The slaves found their lot much improved under a religion which taught that the enfranchisement of a slave was a meritorious action. The Jews, as they had suffered most under the Visigoths, were the chief gainers from a conquest which they had greatly contributed to bring about.

Tolerance

But nothing was so influential in securing ready submission to the Arabs as their tolerance in religious matters. Even the most bigoted adherents of Islam found a practical check to their zeal for proselytism in the loss that would accrue to the exchequer. The Christians had to pay a poll-tax, which varied according to the class to which they belonged. All property was subject to the *kharáj*, a tax proportioned to the produce of the soil, but converts to Mohammedanism were excused from the poll-tax. A clerical chronicler of the 8th century, while bewailing the subjection of Spain to an alien race, says nothing against the conquerors as the professors of a hostile religion. His silence is an eloquent testimony to the haughty tolerance of the Arabs.

As time went on, and the Arabs felt more secure in their position, their rule became not unnaturally harsher. Many of the treaties which had secured favourable terms to the conquered were broken, and the Christians were provoked to resistance by persecution. A notable instance of this was the edict making circumcision compulsory for Christians as well as Moslems. Greater hardships still were endured by the "renegades," most of whom had embraced Mohammedanism from a desire for safety or for temporal gain, and who found that return to the old faith was blocked both to themselves and to their children by

[1] For the West Gothic kingdom in Spain, Gibbon's *Decline and Fall* should be consulted, chapters 31, 36, 37, 38, 41, 51. In note 122 (ch. 38) he remarks on the obscurity of the subject, Spain having had during this period no chronicler like Bede for the Saxons or Gregory of Tours for the Franks. As to the West Gothic laws, there is a good deal of easily accessible information in Guizot's *History of Civilization*, lectures 3, 6, 10, 11. Compare ROMAN LAW, vol. xx. p. 712, and SALIC LAW, vol. xxi. p. 216, section (11).

the law which punished a perverted Mussulman with death At the same time their social position was intolerable, and they were excluded from all lucrative offices and from all share in the government Their discontent led to numerous and stubborn rebellions, but they belong to a later period, and in the 8th century the chroniclers record only a single rising, that of the Christians of Beja, and they seem to have been merely the tools of an ambitious Arab chieftain

Mohammedan discords. It was fortunate for the Arabs that they succeeded at first in conciliating the natives, as otherwise their rule in the Peninsula would have been short lived Internal discord offered the Christians an easy opportunity for successful revolt if they had chosen to avail themselves of it The conquerors were united by religion but not by race When the task of conquest was achieved, and the need for unity was removed by the submission of the vast majority of the natives, quarrels arose between the various races which had taken part in the invasion Besides the Arabs proper, who regarded themselves as the true conquering race, there were Berbers or Moors, Egyptians, and Syrians So difficult was it to prevent their quarrels that it was found necessary to subdivide the conquered territory and to allot separate settlements to the different tribes, a measure which only tended to perpetuate their differences Matters were made worse by the constant efforts of ambitious chieftains to raise themselves to power or to ruin their more successful equals The first forty years of Arab rule in Spain are a period of woeful confusion, and it is difficult even to enumerate the names of the emirs who followed each other in rapid succession The great empire of the Arabs began to fall to pieces as soon as it had reached its greatest extent A movement whose end was conquest began to fail directly it ceased to conquer. The overthrow of the Omayyad dynasty by the Abbásids was a proof that disorder prevailed at the centre The extremities inevitably displayed the same symptoms Each new caliph sent a fresh emir to Spain, the governor of Africa claimed to interfere in the affairs of a province which had been conquered by one of his predecessors, and the native chiefs were often unwilling to submit to a new ruler whose arrival was the result of a revolution in which they had no share and which they would have prevented if they could A capable and energetic governor, confronted with internal dissension and always dreading the arrival of a successor to supersede him, could only devise one way of solving the problem The Arabs were unable to live at peace, and the one means of preventing them from warring with each other was to find them new lands to conquer Hence came the frequent invasions of Gaul, now ruled by the degenerate Merwings, which resulted in the conquest of the provinces of Septimania and Narbonne, and at one time threatened to subject the whole of western Europe to the successor of Mohammed But the battles of Toulouse (721) and of Tours (732) checked the advance of the Moslems, and by 759 they had been compelled to retire from all possessions beyond the Pyrenees Thus thrown back upon the peninsula, it seemed probable that their empire in Spain would speedily succumb to the disruptive forces which had no longer any external outlet

OMAYYADS. 'Abd al-Rahmán. From this fate the Arab power was saved by 'Abd al-Rahmán (Abderame), the one survivor of the Omayyad dynasty, who succeeded after a long series of romantic adventures in escaping from the general massacre of his family (see vol xvi p 578) His arrival in the Peninsula was welcomed by those Arab chieftains who had ends of their own to gain or who saw how impossible it was for Spain to be ruled from a distant centre like Damascus or Baghdad. The resistance of the Abbásid emirs, Yúsuf and 'Alí b Moghíth, was overcome and 'Abd al Rahmán was enabled to found a new Omayyad dynasty at Cordova He and his immediate successors seem to have contented themselves with the title of emir, but all connexion with the eastern caliphate was cut off, and Spain became independent under its new rulers The reign of 'Abd al-Rahman I was spent in almost constant warfare No sooner had he reduced the southern provinces than a revolt broke out in Saragossa under Hosein b Yahya Driven from Spain, where he had raised the black standard of the Abbásid caliph, Hosein fled to the court of Charlemagne and implored his assistance The Frankish army restored Hosein to power, but on its return was almost destroyed by the Basque mountaineers in the famous valley of Roncesvalles (778) After a siege of two years Saragossa was taken, Hosein was put to death as a rebel, and the whole country up to the Pyrenees was compelled to submit to the Omayyad A formidable rising of the sons of Yúsuf was put down in 786, and 'Abd al-Rahmán was enabled to devote the last two years of his life to the arts of peace and to the construction of his famous mosque at Cordova Before his death he settled the succession on his third son, Hisham, who had been born in Spain, and compelled his followers and his elder sons to swear fealty

Hishám. Hishám's reign, which lasted only eight years (788–796), was comparatively uneventful He was successful in foiling the attempt of his elder brothers to seize the throne, but a projected invasion of Gaul was repulsed by the courage of the count of Toulouse Hishám was a devotee,—strict in the performance of religious duties and absorbed in works of charity He completed the mosque which his father had begun, and endeavoured to make Cordova the educational centre of Islam His son and successor, Al-Hakam, was of a very different temperament

Al-Hakam. With a keen enjoyment of the pleasures of life, Al-Hakam disregarded the precepts of the Koran which forbade the use of wine, and his lax practices irritated the *fakíhs*, the "scribes" of Mohammedanism The inability of the Arabs to adapt themselves to a life of peace found expression in a number of isolated risings, of which the most notable took place in Toledo and Cordova The inhabitants of Toledo had never forgotten that their city had once been the capital of Spain, and most of them belonged to the class of "renegades," who had no real attachment to the dominant faith Al-Hakam determined to suppress their discontent by a notable act of cruel treachery Feigning the most complete goodwill, he invited the chief citizens to a banquet in honour of the presence of his son in Toledo As they entered the door they were conducted to an inner chamber and massacred by a band of assassins More than seven hundred are said to have perished on this "day of the fosse" (807), and the citizens, deprived of their leaders, submitted with the torpor of despair The fate of Toledo terrified the Cordovans, and postponed their rising for seven years But in 814 the murder of a blacksmith by one of Al-Hakam's bodyguard provoked a terrible outbreak Besieged in his palace by the infuriated mob, Al Hakam only escaped death by his own coolness and presence of mind A detachment of his guard was sent to fire the houses of the citizens; the mob hurried off to save their families and goods, and a sudden charge of the emir and his soldiers threw them into complete disorder With politic severity Al Hakam destroyed a whole quarter of the city and condemned all the inhabitants to exile. Part of them found a new home in Africa, but others, after a temporary sojourn in Alexandria, conquered Crete, where they founded a dynasty, which lasted till 961, when the island was recovered by the Greeks. The *fakíhs*, the real instigators of the rebellion, were treated with conspicuous leniency, and their leader, Talút, was even admitted to Al Hakam's favour

Christian States. By the end of the 8th century it had become evident that the Arabs had committed a great error in not reducing the whole Peninsula, and that the contemptuous indifference with which they had left the northern mountains to a handful of refugees was destined to bring its own punishment. The early history of the Christian states of Spain is wrapped in a mist of fable and legend, but it is not hard to discern the main outlines. A scanty band of warriors, headed by Pelayo, probably a member of the Visigothic royal family, found refuge in the cave of Covadonga, among the inaccessible mountains of Asturias. Their own bravery and the difficulties of the country enabled them to hold their own, and they became the rallying point for all who preferred a life of hardship to slavish submission. The formation of a Christian kingdom was the work of Pelayo's grandson, Alfonso I, who seized the opportunity when the Arabs were occupied in the disputes attending the accession of 'Abd al-Rahmán I. After driving the Berbers from Galicia, Alfonso advanced with his victorious troops as far as the Douro. But he had not followers enough to colonize the conquered territory, and contented himself with the northern districts, leaving a desert to form a natural boundary between himself and the Moors. Alfonso's son and successor, Fruela I (765–775), fixed his capital at Oviedo, but the greater part of his reign was occupied with the suppression of internal disorders, and he ultimately fell a victim to assassination. His throne was successfully usurped by his cousin Aurelia and his nephew Silo, both of whom sought security against domestic enemies in an alliance with 'Abd al-Rahman. On the death of Silo (784) a party among the nobles elected Fruela's son, Alfonso II, but for six years the western half of the kingdom obeyed a bastard son of Alfonso I by a Moorish captive, nicknamed from his origin El Mauregato. Under Alfonso the Chaste, whose long reign lasted till 842, the Christian kingdom of Oviedo was firmly established. It is impossible to find any accurate account of his achievements. The monkish chroniclers are hardly trustworthy authorities for military history, and they prefer to confine themselves to the more congenial subject of the founding and endowment of churches. The discovery of the pretended tomb of St James at Compostella is in their eyes the greatest event of the reign, and it undoubtedly aided to give a religious character to the war which was destined to be the great crusade of the west.

Alfonso II.'s reign witnessed the establishment of another Christian state in Spain. Charles the Great had been too much occupied elsewhere to avenge the great disaster at Roncesvalles, but he was only waiting for his opportunity. This was offered in 800 by the treachery of another governor of Saragossa, who had revolted against Al-Hakam and sought assistance from the Franks. Charles himself was on his way to Italy to assume the imperial crown, but he sent his son Louis across the Pyrenees. In his first campaign Louis reached the Ebro, but he had to return in 801 to vanquish the obstinate resistance of Barcelona. The administration of the "Spanish mark" was entrusted to Bera, a man of Gothic descent, who proved fully capable of the task imposed upon him. The attacks of the Arabs were repulsed, and their last possessions beyond the Ebro were lost in 811, when Tortosa, after a siege of two years, succumbed to the forces which Louis the Pious had again led over the mountains. Henceforth the province was ruled by the counts of Barcelona, as representatives of the Frankish kings.

To avoid the difficulty of frequent transitions, it will be best to sketch in advance the main outlines of the history of the Christian states down to the formation of the three kingdoms of Aragon, Castile, and Navarre, leaving their relations with the Moors to be narrated in connexion with the caliphate of Cordova. It is impossible to do much more than trace the dynastic and geographical changes, as their mutual quarrels are intricate and wearisome, and of little importance except as prolonging the rule of the Arabs in the Peninsula. **County of Barcelona (813–1150).** The county of Barcelona may be dismissed with a few words. It continued for some time to be subject to Frankish suzerainty, and it suffered from the disorders that followed the break-up of Charles the Great's empire. Bera, its first count, was exiled, and his successor, Bernhard, played a prominent part in the intrigues of that troubled period. At one moment he added Septimania to the Spanish mark, at another he was disgraced and exiled, and finally he was treacherously murdered. In the later part of the 9th century all connexion with Septimania was cut off, and Wilfrid the Hairy (d. 907) was able to make the county hereditary in his family. With its mixed population and its long line of coast the county of Barcelona, or Catalonia as it came to be called, was more involved in the affairs of Gaul than of Spain. Berengar I. annexed the county of Carcassonne and other districts north of the Pyrenees (about 1050–1076), and Berengar III. (1092–1131) obtained Provence by marriage. On the latter's death Catalonia and the transmontane territories were divided between his two sons, and in 1150 Berengar IV., by marriage with Queen Petronilla, obtained the kingdom of Aragon, with which Catalonia was henceforth united.

Kingdom of Oviedo or Leon. The history of Oviedo is more important and more complicated. Alfonso II.'s successors, Ramiro I. (842–850) and Ordoño I. (850–866), had to contend both with the great nobles, who aimed at independence, and with the Basques, who had never learnt to submit to orderly rule. Alfonso III., in a long reign of nearly fifty years (866–910), won the title of "The Great" from the success which attended his arms. While his plundering raids extended as far as Coimbra and Lisbon, he really advanced his frontiers to the Douro, and in order to defend these more exposed territories he transferred his capital from Oviedo to Leon, on the further side of the mountains. In accordance with the universal custom of the Germans, Alfonso divided his territories among his three sons, Garcia receiving the southern districts with Leon as a capital, Ordoño II. western Galicia, and Fruela II. the original district round Oviedo. In 931, however, the kingdom was again united under Ramiro II., a son of Ordoño II., and henceforth called after the new capital, Leon. Under Ramiro, a great warrior against the Arabs, we first hear of a district that was destined to become the most important in Spain. The border territory, a march to the south-east of Leon, previously Bardulia, was now known as Castile, from the number of castles that had been raised to hold it against the infidels. Its count, Fernan Gonzales, was the most powerful noble in the kingdom of Leon, and sought to make himself independent. Ramiro reduced him to submission and then bound him to his side by marrying his eldest son to the count's daughter. Ordoño III. (950–957) sought to emulate his father's achievements against the Arabs, but was hampered by the revolt of his brother Sancho and his father-in-law Fernan Gonzales. Sancho I. (957–966) found an enemy in his recent ally, who attempted to place a rival king upon the throne, and he could only procure restoration to his kingdom by an alliance with the caliph of Cordova. This alliance lasted during the minority of his son, Ramiro III. (966–982), who was deposed by the malcontent nobles in favour of his uncle, Bermudo II. (982–999). The latter, too mild a ruler for such troubled times, had a hard struggle against domestic

treachery and foreign enemies, and left a desolate kingdom to his son Alfonso V. Alfonso succeeded in restoring order, and to his reign are attributed the most important of the *fueros*, on which were based the local institutions of his kingdom.

Rise of Navarre, Castile, and Aragon

Meanwhile a new kingdom had sprung up to the east of Leon, which for a time seemed likely to become the chief state of Christian Spain. The district in the western Pyrenees bordering on the Bay of Biscay was the most defensible position in the Peninsula. It was there that the Basques had held out against the German invaders, and that the Suevi had found a refuge from the Visigoths. The sovereignty of the Moslems and of the Franks had been in turn acknowledged, but had never been more than nominal. About the beginning of the 10th century Sancho founded here the kingdom of Navarre, and he succeeded in extending his rule as far as the lower Ebro. His means of defence were primitive but efficient. When attacked by the infidels in overwhelming numbers he retired to the inaccessible mountains, and recovered the lost ground as soon as the enemy had turned his back. His grandson, Sancho the Great (970–1035), profited by the disasters which befel Leon. He married the sister of Garcia, count of Castile, and when his brother-in-law fell a victim to a conspiracy he seized the opportunity to avenge his death by annexing the northern portion of his country. In 1034 he picked a quarrel with Bermudo III (1028–1037), the son and successor of Alfonso V, and conquered eastern Leon as far as the river Cea. More important still were his acquisitions in the south east of Navarre. Partly by marriage connexions, and partly by the sword, he obtained possession of the counties of Aragon, Sobrarbe, and Ribagorça, which had for years been struggling to maintain their independence against the Mussulman governor of Saragossa. These considerable territories Sancho divided on his death (1035) among his four sons, and the division is an important event in the history of Spain. Garcia, the eldest, received Navarre, with a small district on the right bank of the Ebro; Ferdinand, the second son, obtained Castile, with the addition of the district of Palencia, which had been wrested from Leon; the counties of Ribagorça and Sobrarbe passed to Gonzalo, and that of Aragon to Ramiro, a bastard.

The death of Sancho the Great seemed to offer Bermudo III an opportunity for recovering his lost territories, and he at once collected his forces to attack Ferdinand. In a pitched battle near the river Carrion, Bermudo was defeated and killed, and the conqueror at once annexed Leon with its dependencies—Galicia and Asturias—to his new kingdom of Castile (1037). The eldest brother, Garcia, resented a change which threatened to deprive Navarre of the pre-eminence which it had enjoyed under his father. To gratify his jealousy he did not scruple to ally himself with the emirs of Saragossa and Tudela. But in the battle of Atapuerca (1054) the unnatural coalition was defeated, Garcia lost his life on the field, and Ferdinand added to Castile the district on the right of the Ebro, leaving the rest of Navarre to his nephew, Sancho IV. Meanwhile Ramiro, equally ambitious and successful, got rid of his brother Gonzalo, and seized upon Sobrarbe and Ribagorça to form, with his own inheritance, the kingdom of Aragon. Henceforth the history of Christian Spain centres round the two great states of Castile and Aragon. Leon, much to the disgust of its inhabitants, becomes a province of the former, and Navarre is soon afterwards deprived of independence by its more powerful neighbour.

We must now return to the history of the Arabs. Under 'Abd al-Rahmán II (822–852), one of the mildest and most cultivated of the Omayyad dynasty, began a period of disorder and anarchy which might have ruined his power if the northern states had been prepared to take advantage of it. Toledo, which had recovered its independence soon after the "day of the fosse," was not reduced until after a desperate struggle of eight years, and then its fall was mainly due to internal quarrels. More serious was the growing spirit of insubordination among the Christian population of the south. In spite of the tolerance with which they were treated, the priests persisted in preaching against the rule of the infidel. Under the leadership of Eulogius and his friend Alvaro, a fanatical sect was formed which sought to emulate the glory of the early martyrs. So averse was the Government to resort to persecution that it was only by publicly blaspheming Mohammed that they could bring themselves under the penalties of the law. Eleven persons were put to death for such conduct, who are celebrated in Spanish history as the "martyrs of Cordova." It was in vain that the moderate party denounced their conduct as wanton suicide; the enthusiasts persisted in their defiant conduct. Mohammed (852–866), sterner and more narrow-minded than his predecessor, was not unwilling to take repressive measures, and the execution of Eulogius, who had been chosen archbishop of Toledo, seems to have checked for a time the thirst for martyrdom. But the movement had succeeded in provoking a feeling of distrust between the two religions, and it was difficult to return to the old attitude of easy tolerance. The "renegades" found their position altered for the worse, and under Mohammed they were jealously excluded from all the higher offices of state.

Omayyads (822–1031). 'Abd al-Rahman II.

Mohammed.

A series of revolts showed how prevalent was the feeling of discontent. The Gothic family of Beni-Casi, which had embraced Mohammedanism in order to advance itself, had become extremely powerful in Aragon. Músá, the head of this family, made himself master of Saragossa, Tudela, and Huesca, concluded a close alliance with Toledo, which had again recovered its independence, and claimed to be the "third king in Spain." Músá's death in 862, in a war with Ordoño I of Oviedo, enabled Mohammed to regain Tudela and Saragossa, but his troops were soon expelled by Músá's sons, and the Beni-Casi, with the help of Alfonso III, were for a long time able to bid defiance to the authority of the emir. About the same time an independent state was formed in the west by Ibn-Merwán, a renegade of Merida. But by far the most formidable of these risings was that of 'Omar b. Hafsún, who began as a brigand in the mountains of Andalusia, but whose castle at Bobastro became the centre of all the dissatisfied Christians and renegades of the south. Neither Mohammed nor his son and successor Mondhir (886–888) could reduce this impregnable fortress, and for years 'Omar was the real ruler of Andalusia. His authority was far greater than that of the emirs had ever been; his administration of justice was rude but efficient, and the Arab historians maintain that a girl laden with treasure could in his time cross the mountains in safety.

'Abdallah.

The premature death of Mondhir, a brave and chivalrous prince, gave the succession to his brother 'Abdallah (888–902), who ascended the throne at a very critical moment. Not only had the rising of the Christians and renegades assumed an almost national character, but the Arab nobles had taken advantage of the general disorder to assume the independence that was so congenial to them. 'Abdallah, considering the latter danger the more formidable, sought to gain over the Spaniards, and even offered Ibn Hafsún the government of Regio, on condition that he would acknowledge himself as sovereign. But the negotiation came to nothing, and the only result was to

provoke the indignation of his own race against the emir. Luckily for him the Spaniards had an old debt to pay off against the Arabs, who had long treated them with insufferable contempt. In various districts a desperate civil war broke out, which was destructive of all law and order, but was not directly aimed against the central Government. The most violent struggle was in the province of Elvira, where for a time the natives got the upper hand, and it was only after a desperate conflict that the Arab domination was maintained by the heroism of two successive leaders, Sauwár and Sa'id. In Seville a similar contest arose, and 'Abdallah, after attempting in vain to hold the balance between the two parties, was at last compelled to espouse the cause of the Arabs. An insurrection, in which the life of Mohammed, the emir's eldest son, was in imminent danger, was punished with ruthless severity, but it was the Arab nobles who profited by the success to make themselves absolute masters of the province. The central authority was almost powerless. Most of the provincial governors had thrown off all connexion with Cordova, and the others only rendered obedience when it was convenient to themselves. But at the moment when matters seemed at their worst the tide turned. In 890 'Abdallah won his first victory over Ibn-Hafsún, and during the remainder of his reign he gradually recovered power in the revolted provinces. The work was continued by his son and successor, 'Abd al-Rahmán (or Abderame) III (912–961), the greatest of the rulers of Cordova. Under this prince, who at last assumed the title of caliph, the unity of Mussulman Spain was for the time restored.

'Abd al-Rahmán

No sooner had 'Abd al-Rahmán completed the first part of his task by the reduction of the family of Ibn-Hafsún than he found himself confronted by two dangers. In Africa the Fatimites were establishing a great empire, and it was almost certain that they would turn their attention to Spain as soon as their power was secure in the southern continent. In the north the Christian states had profited by the long anarchy among their old foes and were assuming a very threatening attitude. Alfonso III had moved his capital across the mountains to Leon, and Sancho had recently created the kingdom of Navarre. As regards Africa, 'Abd al-Rahman contented himself with encouraging and subsidizing the princes that still held out against the Fatimites, and with obtaining possession of Ceuta, so as to have complete command of the straits. The northern danger was the more pressing. In 914 Ordoño II made a successful raid into the territory of Merida, and two years later he defeated the army which had been sent to avenge the insult. Although Merida had not yet returned to submission, 'Abd al-Rahmán was determined to conciliate his subjects by proving his ability to defend them. He spared no pains to collect a magnificent army, and his efforts were rewarded in 918 by a great victory over the combined forces of Leon and Navarre. This was the first of a series of successful campaigns, in the course of which he penetrated as far as Sancho's capital, Pamplona. But his victories brought him little beyond glory and revenge. As soon as his troops were withdrawn, the enemy showed himself to be really unconquered. In 921 Ordoño is said to have advanced within a day's journey of Cordova, and in 923 Sancho excited a panic in Mussulman Spain by the capture of Viguera. But the disorders in Leon that followed Ordoño II's death were a great blow to the Christians, and enabled 'Abd al-Rahmán to complete his work of internal reorganization and to turn his attention to resisting the Fatimite conquest of Mauretania. On the death of Sancho, his widow Tota recognized the caliph as suzerain of Navarre.

In his later years 'Abd al-Rahmán was less uniformly successful. The Arabs were disgusted by his policy of excluding the nobles from all share in the government and of filling the chief offices with "Slavs," the generic title for all foreign servants of the court. Ramiro II had succeeded in restoring unity to Leon, and resumed the warlike policy of his predecessors. In 939 he inflicted a serious defeat upon the army of the caliph at Alhandega, and was only prevented from following up his victory by a quarrel with the famous count of Castile, Fernan Gonzales. The divisions which followed Ramiro's death were an additional advantage to 'Abd al-Rahmán, and in 960 he gained the most conspicuous success of his reign when his troops restored the deposed Sancho I. to the throne of Leon. This was almost his last act, as he died in October 961.

"Among the Omayyad princes of Spain 'Abd al-Rahmán III. incontestably holds the first place. His achievements bordered on the fabulous. He had found the empire in a state of anarchy and civil war, divided amongst a crowd of chiefs of different race, exposed to constant raids from the Christians of the north, and on the verge of being absorbed either by Leon or by the Fatimites. In spite of innumerable obstacles he had saved Andalusia both from itself and from foreign rule. He had given to it internal order and prosperity and the consideration and respect of foreigners. He found the treasury in disorder; he left it in the most flourishing condition. A third of the annual revenues, which amounted to 6,245,000 pieces of gold, sufficed for the ordinary expenditure; another third was kept as a reserve; the rest was devoted to buildings. The condition of the country was equally prosperous. Agriculture, industry, commerce, the arts and sciences, flourished together. The foreigner was lost in wonder at the scientific system of irrigation, which gave fertility to lands that appeared most unpromising. He was struck by the perfect order which, thanks to a vigilant police, reigned in the most inaccessible districts. Commerce had developed to such an extent that, according to the report of the superintendent of the customs, the duties on imports and exports constituted the most considerable part of the revenue. A superb navy enabled 'Abd al-Rahmán to dispute with the Fatimites the empire of the Mediterranean, and secured him in the possession of Ceuta, the key of Mauretania. A numerous and well-disciplined army, perhaps the best in the world, gave him a preponderance over the Christians of the north. The most haughty sovereigns were eager for his alliance. Ambassadors were sent to him by the emperor of Constantinople and by the sovereigns of Germany, Italy, and France."—Dozy, iii. 90.

Al Hakam II

The new caliph, Al-Hakam II. (961–976), was distinguished as a patron of literature and a collector of books. The number of volumes in his library was reckoned at 400,000, and he is said to have read and annotated them all. For politics he had comparatively little taste. Naturally averse to war, he was only forced into hostilities by the obstinate refusal of Sancho I. to fulfil the treaty which he had signed on his restoration, and he hastened to conclude peace on an empty renewal of the treaty. The disorders which arose during the minority of Ramiro III. put an end to all danger on the side of Leon, and the death of Fernan Gonzales in 970 removed a ruler who had always been a thorn in the side of the infidel. The most notable event of Al-Hakam's reign is the rise to influence of a man who was destined to play a more prominent part in the history of Spain than any of the caliphs, not excluding 'Abd al-Rahmán III. Mohammed Ibn abí-'Ámir was the descendant of a family which had long been distinguished in the civil administration, but had never been admitted to the higher nobility of the sword. From his

earliest youth he was inspired with the thought that he was destined to rule His ability and the favour of Al-Hakam's favourite wife, Sobh, combined to bring about his speedy advance, and by the time of the caliph's death he held a high office in the court Al-Hakam had done all in his power to secure the succession of his son by Sobh, Hishám, a boy of ten years of age But the chief eunuchs, dreading the influence which a minority would give to Moshafí, the *hájib* or chief minister, sought to give the crown to Moghíra, a brother of Al Hakam With the help of Ibn-abí 'Ámir, Moshafí defeated the plot, Moghíra was put to death, and Hishám succeeded to his father's throne

Hishám II But he never really ruled Ibn-abí-'Ámir, still aided by Sobh, whose lover he was popularly supposed to be, gradually rose to absolute power Moshafí, a man of little real ability, was charged with peculation and deposed, and his younger rival was appointed *hájib* in his place To free himself from all danger from the mob at Cordova, the all-powerful minister transferred the government and the court to Zahrá, which he built for the purpose There the young caliph was immured in a magnificent palace, and was carefully secluded from all contact with public affairs His education was purposely neglected, and he never made the slightest effort to free himself from his gilded imprisonment To remove all obstacles to his authority, Ibn-abí-'Ámir reorganized the army He filled the ranks with Moors from Africa and with Spaniards from Leon, Castile, and Navarre, whom he bound to his cause by lavish generosity The old tribal distinctions among the Arabs, so long the source of jealousy and quarrels, he completely disregarded in the forming of regiments, and thus completed the work of assimilation which 'Abd al-Rahmán III had commenced Though trained to the study of the law and experienced only in civil affairs, he speedily mastered the art of war and conciliated the popular favour by victories such as no caliph had ever won In 981 he defeated Ramiro III and his allies in a pitched battle, took Zamora and Simancas, and

Almansór was only prevented by a storm from capturing Leon On his return he assumed the name of Almansór (victorious by the help of God), by which he is usually known in history Bermudo II, whom the nobles of Leon raised to the throne in place of the defeated Ramiro, could only secure himself by paying tribute to the ruler of Cordova In 985 Almansór invaded Catalonia, which had hitherto been respected as a Frankish fief, drove the count Borrel into exile, and took and sacked Barcelona When Bermudo II sought to free himself from the harsh conditions that had been imposed upon him and drove the Moslem troops from his kingdom, Almansór took a terrible revenge In 987 he stormed Coimbra and razed it to the ground In the next year he advanced into the heart of the kingdom Leaving Zamora, where Bermudo awaited him, on one side, he marched against the city of Leon, and took it after an obstinate resistance The fortifications were utterly destroyed, with the exception of one gate, which was left to commemorate the victor's triumph. Zamora was then attacked, and Bermudo fled to his northern territories, which were all that were left to him

In spite of these successes Almansór had to face more than one conspiracy on the part of those who were jealous of his pre-eminence. The most formidable of these was fomented by his former patroness, Sobh, who found herself more and more thrust into the background She succeeded in gaining over her son, but Almansór soon recovered his ascendency over the feeble caliph, from whom he extorted a document transferring all powers to himself A refusal of Bermudo II to continue the payment of tribute led to the last and most famous of his campaigns, in which he took Compostella and carried off the gates and bells from the shrine of St James, the patron saint of the Christians At the same time his generals were gaining victories in Mauretania, and his power was almost equally dreaded on both sides of the straits His death in 1002 deprived the Spanish Moslems of the greatest ruler and warrior, considering his origin, that their race had produced His campaigns against the Christians, which are reckoned by the Arab historians as more than fifty, were almost uniformly successful Three capitals—Leon, Pamplona, and Barcelona—had been conquered by him His home administration was as successful as his generalship, and much of his attention was devoted to the construction of roads and bridges, so as to facilitate communication between all parts of Spain He was a zealous, if not an intelligent, patron of literature, but his real interests were always practical Finding that he was suspected by the people of a laxness in religious belief, he did not hesitate to prove his orthodoxy by an act of politic vandalism Taking the chief *'ulemá* into the library of Al-Hakam II, he begged them to collect all the books on philosophy, astronomy, and other prohibited sciences, and when they had completed their task he ordered the condemned books to be burnt on a vast pile

Almansór had been absolute in everything but name He had desired at one time to take the final step and to supersede the incapable Hishám II in the caliphate, but he dreaded the inveterate attachment of the people to the Omayyad dynasty He had, however, taken steps to secure the continuance of his family in power His son, 'Abd al Melik Mozaffar succeeded to the office of *hájib*, and ruled with the same authority and success as his father But the position was really untenable An hereditary monarchy is intelligible, but an hereditary line of chief ministers is not The early death of 'Abd al Melik (1008) gave the government to the weaker hands of his brother 'Abd al-Rahmán The latter was hated by the Mohammedan clergy, partly because he indulged in the use of wine, and partly because his mother had been born a Christian She was the daughter of a Sancho, either the king of Navarre or the count of Castile, and her son was nicknamed Sanchol, or the little Sancho The Amirids were not popular Their exaltation irritated, not only the families that claimed a higher rank by birth, but also those who thought themselves their equals Without having any actual grievance to complain of, the people vaguely desired a change of rulers It was easy under the circumstances to effect a revolution When Sanchol returned from a campaign against Leon in 1009 he found that his power had been completely overthrown Mohammed, a great-grandson of 'Abd al-Rahmán III, had headed an insurrection in the capital and had gained possession of the caliph's person Sanchol was put to death, and the magnificent palace which his father had erected at Zahrá was razed to the ground. The Amirids fell, and with them ended the grand period in the history of Moslem Spain

Mohammed was not long content with the office of Mohammed *hájib* Scrupling to kill the unfortunate Hishám, who had never made any opposition to the acts that had been committed in his name, he closely imprisoned him, and buried the corpse of a Christian who bore a strong personal resemblance to the caliph Mohammed was now raised to the caliphate, and assumed the title of Al-Mahdí (guided by God) But his reign was not destined to be long or untroubled. He had been raised to power by a combination of orthodox Moslems, of the so called "Slavs" (foreign slaves serving in the royal harem and in the army of the caliph) and of Berbers, and he alienated each in turn. The Berbers, who formed an important part of the army, were the first to revolt. Raising the standard of Solei-

man, a member of the Omayyad family, they obtained assistance from Count Sancho of Castile, marched upon Cordova, and inflicted a serious defeat upon the troops which Mohammed imprudently led out to meet them Mohammed endeavoured to strengthen his position by producing Hishám II, whom he had given out as dead But the Berbers refused to be turned from their purpose, and occupied Cordova in November 1009 The wretched Hishám was compelled to abdicate in favour of Soleimán, and returned to his prison Mohammed who had escaped to Toledo, now turned for assistance to the Christians, who, by a sudden change of circumstances, had become the arbiters of Mohammedan affairs With the help of troops from Catalonia he recovered Cordova, which had to pay in constant sieges a terrible penalty for the levity with which it had welcomed the fall of the Amirids In pursuing the Berbers, however, Mohammed was again defeated The Slavs, who had hitherto supported him for their own ends, determined to desert the unsuccessful caliph Hishám II was again dragged from prison to assume the throne, and Mohammed was murdered in his presence Wadih, the leader of the Slavs, was now *hájib*, and aspired to play the part of Almansór But his resources were at an end An attempt to increase the taxes roused general indignation, and he was put to death by his own followers (1011) Two years later the nominal reign of Hisham II came to an end Cordova was taken by Soleimán and the Berbers, and the caliph disappeared (1013) His fate remains one of the unsolved secrets of history

Soleiman — Soleimán was now formally proclaimed caliph, but his power was more nominal than real The provincial governors had taken advantage of the civil war to make themselves independent, and Soleimán's authority was only recognized by five towns—Cordova, Seville, Niebla, Oksonoba, and Beja Even within this district he soon found an opponent The Slavs were unwilling to submit to the domination of the Berbers, whose excesses the caliph was unable to check Their most powerful leader, Khairán, had been badly wounded in the late struggle, but on his recovery he determined to avenge his defeat He found a capable ally in 'Ali b Hammúd, a descendant of the famous son-in-law of the Prophet, but whose family had almost ceased to be Arab in their long residence in Africa. 'Alí relied not only upon the Slavs but also upon the Berbers, who regarded Soleimán with contempt, and looked upon 'Alí as a fellow countryman Soleimán's government was easily overthrown (1016), but Khairán's attempt to discover Hishám II was unsuccessful, and he had to acknowledge 'Alí as caliph and to content himself with the office of *hájib* The Hammúdite dynasty, thus established in Cordova, was not destined to enjoy a long tenure of power Khairán revolted against a sovereign who was too able and spirited for the part of a Hishám II, and set up an anti-caliph in the person of another Omayyad, 'Abd al Rahmán IV, a great-grandson of 'Abd al-Rahmán III, who took the name of Mortadá 'Alí was murdered in his bath (1017), but his supporters rallied round his brother Kásim For five years a confused civil war raged which was complicated by the hostility to Kásim of 'Alí's son, Yahyá In 1023 Mortadá was slain in battle, and the Omayyad party gave the crown to another 'Abd al-Rahmán, a brother of the detestable Mahdi Two months later the young prince was murdered, but his successful rival, Mohammed b 'Abd al-Rahmán was driven from Cordova in 1025 The Hammúdite caliph, Yahyá, now occupied the capital, but was slain in attempting to reduce the rebellious *wáli* of Seville to obedience Hishám III, a brother of 'Abd al-Rahmán Mortadá, was now raised to the throne But all central government was by this time at an end, no revenues could be drawn from the rebellious provinces, and in 1031 Hishám abdicated a title which had ceased to have any meaning, and sought peace and retirement in the neighbourhood of Saragossa His death five years later was almost unnoticed even in Cordova With him ended the Omayyad dynasty, which had ruled in Spain for nearly three centuries, and which had produced princes worthy to be ranked with the greatest of their contemporaries Its decline dates from the time when it allowed power to slip from its hands and to be wielded by ambitious ministers

Hammúdites — Decline of the Omayyads.

Ever since the death of Almansor Moslem Spain had been gradually splitting up into a number of independent principalities With the extinction of the Omayyads the last semblance of unity disappeared "The Berber generals shared the south, the Slavs ruled in the east, the rest was divided either among successful adventurers or among the small number of noble families who had been fortunate enough to escape the blows which 'Abd al Rahmán and Almansór had struck at the aristocracy Finally, the two most considerable towns, Cordova and Seville, were organized as republics" (Dozy) Into the history of the numerous dynasties which were established during this period it is impossible to enter here, but the reader will find the subject not only fully but attractively treated in the fourth volume of Dozy's *Histoire des Musulmans d'Espagne* See also Plate VII

States of Castile and Aragon formed — It was of additional moment that this disruption of the Mussulman power was contemporary with the formation of the great Christian states of Aragon and Castile They were not slow to profit by the opportunity held out to them It was in this century that the Christian cause found a champion in the famous Ruy Diaz Campeador, who under the name of "The Cid" became the traditional hero of Spanish mediæval history Ferdinand I of Castile (1037–1067) captured the strong places of Viseu, Lamego, and Coimbra, and was only diverted from the conquest of Toledo by the humble submission of the emir, who undertook to pay tribute to the Christian king The unfortunate division of his territories between his three sons gave occasion to civil wars, which were only terminated in 1072 by the reunion of the whole kingdom under Alfonso VI Following up his father's successes, Alfonso made himself master of Toledo, which once more became the capital of a Christian state Meanwhile Ramiro I of Aragon (1035–1063) drove the Moors from their last possessions in the counties of Aragon and Sobrarbe His son, Sancho Ramirez (1063–1094), joined Alfonso VI in an attack on Navarre which resulted in the partition of that state between the two kings, and commenced a war against the emir of Saragossa which ended, under his successors Pedro (1094–1104) and Alfonso I (1104–1136), in the conquest of Huesca and Saragossa The latter town became henceforth the recognized capital of Aragon

Relations with Rome — This period is also important in another aspect Hitherto the Christian kingdoms of Spain had been naturally isolated from the rest of Europe But the papacy, under the guiding hand of Hildebrand (Gregory VII), was now making its ecclesiastical supremacy a reality, and was not likely to tolerate independence even in the most distant members of the church Aragon, which lay nearest to the other states of Western Christendom, made little difficulty about complying with the papal demands Ramiro not only agreed to adopt the Roman ritual in his kingdom, but even sent tribute to Alexander II Castile, lying farther distant, was more inclined to resent dictation At a council at Burgos (1077) it was formally decided to retain the Gothic ritual But Alfonso VI realized the danger of isolating his state from the rest

of Europe, and of his own accord conceded the demands of Gregory VII. From this time Christian Spain was directly connected with Rome, and became the most faithful, if not the most servile, of Roman Catholic countries.

Almoravid campaigns in Spain (1069–91)

The Christian victories of the 11th century seemed likely at one time to annihilate the Mohammedan power in Spain. From this fate, however, it was saved, not by any internal strength, but by the arrival of assistance from Africa. The emir of Seville, Al-Mo'tamid, the most powerful of the Moslem princes, watched with profound misgiving the progress of the Castilian arms. When Toledo fell before Alfonso VI he determined to appeal to Yúsuf b. Táshufín, the king of the Almoravids,—a confederation of Berber sectaries that had recently established a vast empire reaching from the Senegal to Algiers. Yúsuf, who had established his capital at Morocco in 1069, was at this time eighty years of age, but he did not hesitate to accept the prospect of a new field of conquest and adventure. In 1086 he sailed from Ceuta to Algeciras, the cession of which he had demanded as the price of his aid, and was at once joined by the forces of the emirs of Andalusia. Alfonso VI hastened to obtain assistance from the king of Aragon and the count of Barcelona, and with a larger force than had ever before been assembled in the Christian cause he met the Moors in the battle of Zalláka (Sacralias), a few miles from Badajoz (October 1086). After an obstinate struggle victory declared for the infidels, and Alfonso had great difficulty in escaping with his life. Luckily for the Castilians, Yúsuf was recalled to Africa by the death of his eldest son, whom he had left at Ceuta, and his victory, which might have been as decisive as that of Tárik, was not followed up. Alfonso even ventured to resume his aggressions, and laid siege to the important towns of Murcia and Almeria. Mo'tamid, seeing that the danger was as great as ever, proceeded to Africa in person in order to urge the return of Yúsuf. The Almoravid prince, on whom the attractions of Andalusia had made a profound impression, crossed again to Algeciras (1090), and this time the predictions of the princes who had foreseen the risk of calling in so powerful an ally were fully verified. Postponing the task of resisting Alfonso, Yúsuf set to work to make himself master of Andalusia. Mo'tamid himself had to fly from his territories, after a futile appeal for aid to the king of Castile. Captured by the Africans, the emir of Seville was condemned to end his life in close imprisonment. In the course of a few years the whole of Moslem Spain was reunited under the king of Morocco, and the death of the Cid in 1099 enabled the Moors to recover Valencia, which he had taken in 1094. This was the last event of the reign of Yúsuf, who in 1103 handed over the government to his son 'Alí and returned to Africa, where he died three years later at the ripe age of a hundred years.

Alfonso VI of Castile.

Alfonso VI of Castile had raised his kingdom to such pre-eminence in the Peninsula that he had assumed the title of "emperor of Spain." But a great disaster clouded his later years. In 1108 his only son Sancho perished with the flower of the Castilian chivalry on the fatal field of Ucles, and most of Alfonso's conquests passed into the hands of the victorious 'Alí. In 1109 the emperor died, leaving the succession to his daughter Urraca, the widow of Count Raymond of Burgundy.

Temporary union of Castile and Aragon.

In order to secure the unity of the Christian kingdoms, Urraca was married to Alfonso I. of Aragon (1104–1134), who imitated his father-in-law in assuming the imperial title. But the marriage failed to produce the desired result. Urraca induced the Castilian nobles to revolt against the Aragonese rule and to set up Alfonso VII., her son by her first marriage. A civil war ensued, which was only ended in 1127 by the separation of the kingdoms. Alfonso I retained Aragon and Navarre, while Castile, with Leon and Galicia, passed to Alfonso VII. Alfonso of Aragon renewed the war against the Moors which he had so gloriously begun by the capture of Tudela and Saragossa, but in 1134 he was completely defeated in the battle of Fraga, a disaster which hastened his death. As he had no children, he bequeathed his territories to the great crusading order of the Templars. The Aragonese however, refused to recognize this testament, and gave the crown to his brother, Ramiro II (1134–1137), who was brought out of a monastery to continue the dynasty. Ramiro fulfilled his duties by marrying a sister of the duke of Aquitaine, who bore him a daughter, Petronilla. At the age of two the child was betrothed to Raymond Berengar IV of Barcelona, and Ramiro, leaving the administration of the kingdom to his son-in-law, hastened to return to his cloister. Thus a permanent union was effected between Aragon and Catalonia, both of which passed in 1162 to Petronilla's son, Alfonso II. But, if Catalonia was gained, another province, Navarre, was lost.

Navarre independent.

The Navarrese had long desired to recover their independence, and on the death of Alfonso I they refused to acknowledge Ramiro, and chose a ruler of their own, Garcia Ramirez. Ramiro, who needed Garcia's generalship against a threatened attack from Castile, recognized him, first as a vassal of Aragon and afterwards as an independent king. Thus Navarre regained its place among the kingdoms of Spain, though it never enjoyed its old importance.

Crusading orders.

The main interest of Spanish history in the 13th century centres round the war against the Moors, which was beginning to attract the interest and assistance of the other European states. It was the age of the great crusades, and Christendom was absorbed in the struggle against the infidel, both in the East and West. Spain, like Palestine, had its crusading orders, which vied with the Templars and Hospitallers both in wealth and military distinction. The order of Calatrava was founded in 1158, that of St James of Compostella in 1175, and the order of Alcantara in 1176. The kingdom of Portugal, which had risen with great rapidity in the 12th century, had a no less distinguished order, that of Evora. These military priests, debarred by their profession from the ordinary interests of humanity, gave a firmness and consistency to the Christian cause which had too often been sacrificed to the dynastic quarrels of the temporal princes.

Struggles of Almoravids and Almohades.

The empire of the Almoravids, like so many of its predecessors, had soon begun to fall to pieces. It was too large and unwieldy for permanence. Its real centre was at Morocco, and the attention of the caliphs was absorbed in the affairs of Africa, while the extortion and misgovernment of their viceroys excited discontent among the Mohammedans of Spain. This state of things gave a great advantage to Alfonso VII of Castile, who revived the title of emperor of Spain, allied himself with Raymond Berengar of Barcelona and Aragon, and sought to emulate the achievements of his grandfather. For the second time the Moorish power in Spain was only saved from dissolution by the arrival of reinforcements from Africa. As happened so often in Mussulman history, a movement which began with religious reform ended with the formation of an empire. Mohammed b. 'Abdallah, an Arab from Mount Atlas, gave himself out as the expected Mahdí, and formed a sect known as the Almohades (Unitarians). His disciple, 'Abd al Mu'min, was chosen as his successor, and soon overthrew the power of the Almoravids. Táshufín, 'Alí's son, made a vigorous but ineffectual resistance, and the conqueror crossed the sea to complete his work by the reduction of Spain (1146). The success of 'Abd al-Mu'min, if less rapid than that of Yúsuf,

was quite as complete. The Almoravids appealed to the Christians, and both Castile and Aragon came to their aid. Alfonso VII., with the help of the Genoese and Pisan fleets, besieged and took Almeria, while Raymond Berengar captured Tortosa. But these successes were only temporary. In ten years the Almoravids had been driven from the mainland, and only a small remnant found refuge in the Balearic Islands. Almeria was again wrested from the Castilians, and in 1157 Alfonso VII. died, the last of the series of "emperors of Spain." His territories were divided between his two sons, the elder, Sancho, succeeding to Castile, while Leon went to his brother Ferdinand. The quarrels which resulted from this partition would probably have been fatal to the Christian cause but for the exertions of the great knightly orders. The successors of 'Abd al-Mu'min (d. 1163), Yúsuf and Ya'kúb Almansór, continued to advance the power of the Almohades, and the latter inflicted a crushing defeat at Alarcos (1195) upon Alfonso VIII. of Castile, who had succeeded his father Sancho in 1158. Castile was at this time distracted by the feuds of the great families of Lara and Castro, and the count of Castro, who had been worsted by his rival, rendered conspicuous service to the infidels in the battle. Even Sancho of Navarre, out of jealousy of the rival kings, concluded an alliance with the Almohades.

Separation of Castile and Leon.

Downfall of the Almohades.

Luckily for the Christians Ya'kúb, the most formidable opponent they had had to face since the great Almansór, died in 1199, and his death was followed by a rising of the Almoravids which took five years to suppress. Meanwhile successful efforts had been made by the pope and clergy to arrange the differences among the Christian states, and a confederation was formed between the five kings of Castile, Aragon, Leon, Navarre, and Portugal. When Ya'kúb's successor, Mohammed al-Násir, had succeeded in restoring order in Andalusia and prepared to march against the Christians, he was confronted by the allies in the famous battle of Las Navas de Tolosa, in the Sierra Morena (July 16, 1212). After an obstinate struggle the Christians gained a decisive victory, and their success decided the fate of Spain. The religious impulse which had constituted the original strength of the Almohades had come to an end; they were regarded as infidels by the orthodox Moslems, and the first failure necessarily led to their downfall. The cruelties with which they sought to repress the rising discontent only excited popular feeling against them, and when Al-Motawakkil, a descendant of the family of Ibn Húd which had once ruled in Saragossa, raised the standard of revolt in Andalusia, the bulk of the population joined him, and Al Ma'mún, the last of the Almohades who held any power in Spain, fled to Africa in 1232. The chief result of their rule was to depress the Arab element in the Mussulman population of Spain. Hitherto the Arabs, though numerically in a minority, had retained the preponderance due to their original prestige. Henceforth the infidels of Spain can only be considered and spoken of as Moors.

Castile and Leon reunited.

After the fall of the Almohades the triumphs of the Christian arms were rapid and decisive. The separation of Castile and Leon, which had been productive of so much disaster, was finally terminated in 1230 by the accession of Ferdinand III., the son of Alfonso IX. of Leon and Berengaria of Castile. The province of Estremadura had been annexed to Leon by Alfonso IX., and now formed part of the united kingdom which under Ferdinand III. rapidly extended itself southwards. In 1233 the Castilian army won a great victory over the Moors under Al-Motawakkil, and three years later Ferdinand himself captured Cordova, so long the capital of the Mohammedan rulers and one of the most wealthy and beautiful cities of Europe. In 1237 Al-Motawakkil was assassinated, and with him perished the last semblance of Moorish unity. The numerous emirs became independent rulers, and the most powerful of them, Mohammed Ibn al Ahmar of Granada, became a tributary of Castile and ceded the strong town of Jaen (1246). In 1248 Seville, the second of the Mohammedan cities, submitted to Ferdinand, who within a few years annexed Xerez de la Frontera, Medina Sidonia, and Cadiz. By these acquisitions the frontier of Castile was extended to the southern coast before Ferdinand III.'s death in 1252. A considerable number of Moors submitted to the rule of Castile, but the Christians had become intolerant during the long war, and most of the conquered population sought a new home either in Granada or in Africa.

Successes of Aragon.

Meanwhile Aragon had taken a no less important part in the struggle. Pedro I. (1196–1213), the successor of Alfonso II., had excited the discontent of his subjects, partly by seeking coronation from Pope Innocent III., and partly by his excessive taxation. The "union" of nobles and towns compelled the king to diminish his exactions. Pedro took part in the battle of Navas de Tolosa, but his attention was diverted from Spanish affairs by his relationship with Raymond of Toulouse, which involved him in the Albigensian crusade, where he met his death. His son James I. (1213–1276), however, resumed the war against the infidels, and won in it the title of "The Conqueror." With the help of his Catalonian subjects, at that time perhaps the most accomplished sailors in the world, he conquered the Balearic Islands (1229–1233), which had long been a stronghold of the Moslem and a centre for piratical attacks upon the Christian states. Still more important was his reduction of Valencia (1238), which had once before been conquered by Ruy Diaz. The last achievement of the great king was the conquest of the province of Murcia (1266), the last of the Moorish territories in Spain except Granada. Murcia, though reduced by Aragon, was handed over to Castile. By the acquisition of Algarve Portugal had already acquired frontiers which correspond roughly to those which it has at the present day.

Cessation of the crusade.

From the latter half of the 13th century the crusading energy of the Spaniards came to a sudden standstill, and the Moors were allowed to retain possession of Granada for more than two centuries. The causes of this abrupt termination of the war before it had reached what seemed to be its natural and legitimate end have often been discussed. In the first place Castile was henceforth the only state which was directly interested in the war. By the acquisition of Seville and Murcia it had separated Granada both from Portugal and Aragon, neither of which states had henceforth any conterminous frontier with the Moors. The state of Granada, though small when compared with Castile, was by nature easily defensible, as was made amply apparent in the last campaigns under Ferdinand and Isabella. The attention of Castile was often distracted by foreign interests or by internal dissensions. Again, the Moors were more concentrated and homogeneous in Granada than they had been when their rule was more extensive. The large subject population, many of whom were Christians or renegades, had been a great source of weakness, and this no longer existed. They, like their opponents, had given up the tolerance that had once distinguished them, and hardly any but true Mohammedans can have remained in Granada. Something, too, must be attributed to the wily policy and well-timed submission of Mohammed Ibn al-Ahmar, who even gave assistance to Ferdinand III. against the other Moorish emirs.

With the termination of the crusade Spanish history loses what little unity it had possessed for the last two

Moorish Granada. centuries, and it becomes necessary to follow the fortunes of each state separately. Into the history of Granada it is as impossible as it would be tedious to enter within the limits of this article. It is a long record of revolution and civil war, in which nothing above the most petty personal interests are concerned. There is no change of dynasty, but one perpetual struggle between members of the same family. It would not be easy to enumerate even the names of the successive rulers, many of whom were several times deposed and restored to power. Even during the final struggle, when the existence of the kingdom was at stake and the one hope of resistance lay in unity, the national cause was sacrificed to the jealous rivalry of three claimants of the throne. The history of Castile and Aragon, on the other hand, assumes a new character and interest when the attention of kings and people ceased to be absorbed in the overwhelming excitement of a great religious war.

CASTILE (1252–1479). The constitution of Castile traced its origin back to the institutions of the Visigoths, which had been carried by the original refugees into the mountains of Asturias, but it had been profoundly modified by the circumstances under which the kingdom had risen to greatness. The war with the infidel, while it had given strength and unity to the monarchy, had at the same time compelled Constitution of the kingdom. the granting of considerable independence to the nobles and the great towns. The religious character of the war had enabled the clergy to retain greater powers than they possessed in any other European country, though they had lost that omnipotence which they had enjoyed under the Visigoths. Their councils and synods, which had once formed the sole constitutional machinery of the country, had been superseded by the secular assembly of the cortes. The early history of the cortes is wrapped in great obscurity, but its main outlines are fairly discernible. Originally a meeting of the great nobles and royal household, it had attained the position of a national assembly in 1162, when the deputies of the chief towns were admitted to membership. Its powers and procedure developed gradually, and naturally varied according to the character of the different kings. Its first functions were the approval of legislation and the granting of extraordinary taxation, though it is difficult to say when its sanction of such measures was regarded as essential. The assembly consisted of the three estates—clergy, nobles, and citizens—who deliberated sometimes separately and sometimes together. Representation existed only in the case of the third estate, whose members were elected at first by all free citizens and afterwards by the municipal magistrates. The number of cities which sent deputies varied very much at different times. As to what constituted the right of attendance in the case of the nobles and clergy there is great obscurity, but it probably depended partly upon tenancy-in-chief and partly upon royal summons. As both classes were exempt from taxation, their functions were less important than those of the third estate, and on more than one occasion we find meetings of the cortes in which the upper orders took no part. The weakness of the assembly, as contrasted with the English parliament, lay mainly in the absence of any class like the knights of the shire to form a link between the burgesses and the great nobles. In early times, probably the most effective check upon the royal power lay in the independent privileges claimed and exercised by the chief feudatories. Their tenants were bound to feudal service, and the right of private war made them petty sovereigns on their own estates. The long feud of the families of Castro and Lara is only a notable example of the difficulties which the central power had to contend with. For the protection of their privileges, both nobles and towns claimed the right of forming an armed union or *hermandad*, which resembled the right of "confederation" exercised in later times by the nobles of Poland. The ordinary administration, except when war was going on, was local rather than central. The nobles had judicial powers within their domains, though it appears that these were granted by the crown rather than derived from their territorial position. The bishops and higher clergy administered ecclesiastical jurisdiction as in other countries, and at the same time exercised the same powers as the secular lords over the large estates which the piety or superstition of generations of benefactors had conferred upon them. The connexion with Rome, though established in the 11th century, had not become very close before the middle of the 12th century; the appointment to most of the benefices was in the hands of the crown, and the church of Castile was more independent even than that of England. In the cities and great towns, most of which included a considerable extent of adjacent territory, the administration both of justice and of local affairs was in the hands of elected corporations, which had received grants of liberties at the time when they had served as important outposts against the attacks of the infidel. In theory, probably, there existed in all cases a right of appeal to the crown, but this was a right which, in the nature of things, was rarely exercised. The attempt of subsequent kings to control or supersede the local administration of justice by the appointment of *corregidores* was always resisted as an encroachment upon traditional liberties. Even the taxes, though granted by a central assembly, were assessed and collected by the local officials, and jealous care was taken to secure that they should only be applied to the purpose for which the grant had been made.

Ferdinand III., "The Saint," was succeeded in 1252 by his son, Alfonso X., "The Wise." The new king gave up the military policy of his father, and the only territorial acquisition of his reign, the province of Murcia, was won for him by the arms of Aragon. On the other hand, he was a great student and patron both of literature and science, especially of astronomy. He invited to his court the most distinguished scholars not only in Christian but also in Arabic lore, and he raised the university of Salamanca to rank with the great schools of Paris and Oxford. He also turned his attention to legislation, and his code, the *Siete Partidas*, is one of the great legislative monuments of an age which produced the *Établissements* of St Louis and the great statutes of Edward I. Compiled under the influence of the civil and canon laws, the *Siete Partidas* was in some respects disadvantageous, especially as admitting papal encroachments upon the ecclesiastical power of the crown. Though drawn up under Alfonso X., it did not finally supersede the ancient *fueros* until 1348, when it was formally approved by the cortes. But Alfonso's reign, though distinguished in the history of literature and law, was not on the whole a prosperous period for Castile, and it was to a great extent his fault that the opportunity of driving the Moors from the Peninsula was allowed to slip. On the fall of the Hohenstaufen he came forward as a candidate for the imperial dignity, and through the period known as the "great interregnum" he and Richard of Cornwall, chosen by rival parties among the electors, bore the empty title of king of the Romans. The expense of bribing the electors and of maintaining a magnificent court involved Alfonso in pecuniary difficulties and compelled him to alienate his subjects by imposing heavy taxes and by debasing the coinage. But the hardships inflicted on the country by the king's futile ambition were as nothing compared with those which arose from a disputed succession to the crown. By the old custom of Castile nearness

Alfonso the Wise.

of blood gave a superior claim to priority of descent, so that the second son of a king would be preferred to the children of the eldest son. The *Siete Partidas* recognized the more modern rule of succession, but, as that code had not yet been accepted by the cortes, its ruling had no binding force. The question arose in 1275 when Alfonso's eldest son, Ferdinand de la Cerda, perished in a campaign against the Moors, leaving two sons, Ferdinand and Alfonso. The king's second son, Sancho, was at once declared heir to the crown, but the widow, Blanche, announced her intention to uphold the rights of her children, and she received support both from Pedro III of Aragon and from her brother, Philip III of France. A long war followed, which was further complicated when Alfonso X, having quarrelled with his son, proposed a partition between the rival claimants. So far did the dispute go that the Moors, instead of being attacked in Granada, were called upon to give their assistance to the factions among their enemies.

The result of these internal quarrels was to increase the already excessive power of the noble families, and this was productive of further disturbances in the reign of

Sancho IV

Sancho IV (1284–1295). The family of Castro seems to have sunk into comparative insignificance, but the Laras had found a new rival in the house of Haro. The whole state was divided by their feuds, and the king found himself degraded from the position of arbiter to that of a partisan. The condition of affairs became even worse when the death of Sancho gave the crown to his

Ferdinand IV

infant son Ferdinand IV (1295–1312). In an early stage of society a minority is always an evil, and Castile at this period had more than a fair share of such misfortunes. The crown was contested, not only by the late king's brother John, but also by Alfonso de la Cerda, who returned from France to maintain a claim which had already been negatived by the accession of Sancho. The king of Aragon supported Alfonso, while the rulers of Portugal and Granada mixed themselves up in the quarrel to obtain advantages for themselves. The regency had been bequeathed by Sancho to his widow, Maria de Molina, but her marriage had been declared uncanonical by the pope, so that a slur was cast upon the legitimacy of her son. Nothing but the great skill and capacity displayed by the regent could have secured victory under such discouraging circumstances. By mingled submission and defiance she disarmed one opponent after another, induced the pope to ratify her marriage, and finally succeeded in transferring the government to her son on his coming of age. Ferdinand's harshness provoked a renewal of the conflict, but ultimately the treaty of Camillo (1305) put an end to the struggle, and compensated the princes of La Cerda with lavish cessions of territory. Alfonso preferred to remain an exile rather than to abandon his claims, but his son accepted the proffered conditions and became the founder of the great house of Medina Sidonia. But the treaty made little difference to the country. Disorder and civil war had become a chronic disease in Castile, and Ferdinand IV was himself too deeply imbued with the spirit of the age to maintain peace with a strong hand. The story that is told about his death illustrates his character. In spite of a solemn promise made twice during his reign that every accused person should have a fair trial, he ordered two brothers of the name of Carvajal to be put to death without the pretence of judicial forms. They summoned him to appear before the supreme tribunal within thirty days, and on one morning within that period he was found dead in his bed. The cause of his death was never ascertained, but the people regarded the event as a judgment, and he has received from this story the name of "The Summoned" (*El Emplazado*).

Ferdinand IV's death was followed by another and still longer minority, as his son, Alfonso XI (1312–1350), was only two years old at the time. The regency was

Alfonso XI

claimed by the late king's brother Don Pedro and by his uncle Don John, and from this dispute arose a civil war fiercer and more destructive than any of its predecessors. The central authority ceased to exist, both nobles and towns had to protect themselves as best they could, the royal domains were seized upon by rapacious neighbours, and the person of the young king was only saved by his being concealed in the cathedral of Avila. At last the mediation of the pope and of Maria de Molina brought about a compromise, and the administration was divided between the two regents,—Pedro taking the south-eastern and John the north-western provinces (1315). But a few years later they were both killed in a joint campaign against the emir of Granada, and the disorders broke out with worse violence than ever (1319). Four "infants," as the members of the royal family were called, contended for the government, and the assumption of power by the king himself at the age of fifteen failed to put a stop to their feuds. The character of Alfonso XI was as harsh and brutal as was to be expected in a man who had been educated in such troubled times. He invited his cousin, a younger Don John, to a banquet in the royal palace, and treacherously murdered him. His treatment of his first wife, whom he divorced in order to marry a daughter of the king of Portugal, provoked her father, Don John Emanuel, a nephew of Alfonso X, to head a rising which took years to suppress. The Portuguese princess was also repudiated by her husband, who had been inspired with a passion for the beautiful Eleanor de Guzman, and the forces of Portugal were added to those of the Castilian rebels. After a long struggle (1335–1337) Alfonso XI succeeded in reducing his opponents to submission, while he conciliated Alfonso IV of Portugal by restoring his daughter to her position as queen. The restoration of unity was extremely opportune, as Spain was threatened at this moment by a new invasion from Africa. Abu 'l Hakam, the head of the Merinids and emir of Fez, crossed over to Gibraltar with a huge army in 1339, and was acknowledged as suzerain by the ruler of Granada. Assistance was obtained both from Aragon and Portugal, and in 1340 Alfonso XI marched to the relief of Tarifa, which was besieged by the Moors. On the banks of the Salado the Christians won a great victory, which destroyed the last chance of a revival of the Mohammedan power in Spain. Abu 'l Hakam fled to Africa, and in 1344 Alfonso concluded a glorious war by the reduction of Algesiras. In the hope of cutting off all connexion between Granada and Africa, Alfonso laid siege to Gibraltar in 1350, but before he could accomplish his design he was carried off by the Black Death. His victories over the infidel have led the Spanish historians to gloss over the acts of cruelty and treachery which have left an ineffaceable stain upon his character. His reign, troubled as it was, constitutes an important epoch in the history of Castilian liberties. In 1328 he issued two laws which formed the firmest basis of the powers of the cortes. He recognized the right of that assembly to be consulted in all important matters of state, and he solemnly pledged himself and his successors not to impose any new tax without its approval and consent. These concessions were to some extent counterbalanced by his restriction of the right of electing deputies to the *regidores* or magistrates of each city. This narrowing of the franchise was a great blow to the popular rights, and it gave the crown facilities for tampering with the elections which were frequently abused in later days. But at the time the municipal magistrates enjoyed considerable independence, and for several generations the cortes showed no signs of subservience. In fact

Alfonso's position made him dependent upon the support of the citizens against the great lords, so that he was not likely to aim at diminishing the power of the former class. Another important event of the reign was the granting by the cortes, for the expenses of the Moorish war, of the *alcavala*, a tax of a twentieth upon every sale of real or personal property. This tax, one of the most ruinous that can be conceived, illustrates the want of economical insight in the 14th century, and was destined in later times to seriously impede the industrial and commercial development of Spain.

Pedro I. The atrocities of Alfonso XI.'s reign sink into insignificance when compared with those committed by his son and successor, Pedro I. (1350–1369). The story of the latter's rule is mainly derived from the narrative of his avowed enemies, but there is no reason to doubt the substantial accuracy of the charges which have given him the name of "The Cruel." Some of his actions may perhaps be attributed to a politic desire to destroy the ascendency of the great nobles, whom the princes of the royal house had often headed against the crown; but most of them can only be explained by a thirst for bloodshed which almost amounted to mania. He ascended the throne at the age of sixteen, and was at once urged by his mother Maria of Portugal to avenge the wrongs which she had endured at the hands of her rival, Eleanor de Guzman. The unfortunate Eleanor was strangled in prison, and her sons could only secure safety by flight. The eldest, Henry of Trastamara, found a refuge first in Portugal and afterwards in France. A wife was now found for the young king in Blanche, daughter of the duke of Bourbon, in the hope of strengthening his throne by a French alliance. But Pedro had formed a connexion with Maria de Padilla; and, when he was at last induced to go through the marriage ceremony with Blanche, he quitted her immediately to return to his mistress, whose brothers he advanced to the chief offices of state. A conspiracy of nobles, headed by Alfonso of Albuquerque, lately the king's favourite, was suppressed with ruthless severity. Pedro now concluded a second marriage with Juana de Castro, although Blanche was still living, but he again returned to Maria de Padilla. Another conspiracy, backed up by the pope and the French king, was more successful. After standing a long siege in Tordesillas, Pedro was compelled to concede the demands of the coalition and to acknowledge Blanche as his lawful queen. But his submission was only feigned. Seizing the opportunity of a hunting-party to escape from the imprisonment in which he was kept at Toro, he rallied a mercenary army round him and took terrible vengeance upon his opponents (1355–56). Henry of Trastamara, who had joined in the rising, escaped to France, where he took part in the war against the English. It would be wearisome to catalogue the long list of cruelties, beginning with the murder of the unfortunate Blanche of Bourbon, of which Pedro was guilty during the next ten years. It seems almost incredible that such a monster should have been allowed to reign in a country which had already shown so much independence as Castile. But several causes combined to secure him against deposition. In the first place, it was upon the nobles and the Jews that his hand fell with such severity, while to the citizen class he was on the whole a lenient ruler. This explains why it was that the cortes made little or no opposition when he endeavoured to secure the succession to his own children. In 1362 he solemnly swore that he had been lawfully married to Maria de Padilla, and his four children by her were recognized as heirs to the crown. His son Alfonso, however, died in the same year, and only two daughters, Constance and Isabella, survived their father. Another point in Pedro's favour was the outbreak in 1356 of a war with Aragon, which lasted almost without intermission for the rest of the reign, and in the course of which the Aragonese king was joined by Henry of Trastamara. Much as the Castilian nobles hated Pedro, they hated Aragon still more, and they were unwilling to accept a king who might seem to be forced upon them by the neighbouring kingdom. This war was in a way harmful to the interests of both kings. They were both eager to depress the powerful nobles in their territories, but their continued hostilities only enabled these nobles to extend their power. On more than one occasion this community of interest was on the verge of leading to an agreement which would probably have excluded the house of Trastamara for ever from Castile, but each time national and personal enmity combined to revive the quarrel. Though Castile was larger and possessed of more resources than its rival, the presence of a large number of Castilian exiles in Aragon made the combat fairly even. But in 1365 Henry of Trastamara obtained new and more formidable auxiliaries. Charles V. of France, who was now beginning to reorganize that country after the English wars, was only too glad to allow the disorderly bodies of disbanded soldiers to seek employment in Spain under the leadership of Bertrand du Guesclin. To these formidable enemies Pedro did not venture to offer resistance, and fled to Bayonne, while his half-brother Henry was everywhere acknowledged as king (1366). But Pedro succeeded in convincing the Black Prince of the justice of his cause and of the impolicy of allowing the French king to gain overwhelming influence in the Peninsula. Before the end of the year Edward's army had crossed the Pyrenees, a number of English mercenaries in Du Guesclin's service deserted to the banner of their old leader, and in April 1367 was fought the great battle of Najera or Navarrete, near Logroño. Du Guesclin was taken prisoner; Henry of Trastamara fled to France; and Pedro was restored to his throne. But the Castilian king had learnt no wisdom from adversity. His barbarity disgusted his allies, who were further alienated by his failure to furnish his promised supplies. The fever had already begun to decimate his troops and to weaken his own health when the Black Prince quitted Castile. His departure gave another opportunity to Henry of Trastamara, who had obtained fresh reinforcements from Charles V. In 1369 the battle of Montiel was decided in Henry's favour. Pedro was taken prisoner, and was killed in a personal struggle with his rival, into whose tent he was brought. His two surviving daughters had been left as hostages at Bordeaux, and were married to two brothers of the Black Prince,—John of Gaunt, and Edmund Langley, duke of York.

Henry II. Henry II. (1369–1379) was of illegitimate birth, and his marriage with the heiress of the La Cerdas was hardly sufficient to remove all doubts as to his claim to the succession. But within his kingdom he met with little opposition. The Castilians were glad to settle down under an orderly government after the late reign, and the few malcontents exiled themselves to join the foreign claimants of the throne. The most important of these was Pedro I. of Portugal, whose grandmother belonged to the legitimate line of Castile, and John of Gaunt, who came to Spain to vindicate the rights of his wife Constance. Pedro I. proved for a time a formidable enemy. He allied himself with the Moors, who seized the opportunity to recover Algesiras, and with the king of Aragon, who annexed the border districts of Castile. But Pedro was an incapable warrior, and soon abandoned his own claim to obtain the English support by acknowledging John of Gaunt. But this enabled Henry to renew his alliance with France, and with the help of French troops he invaded Portugal, besieged Lisbon, and compelled Pedro to make peace

Two years later a treaty was concluded with the king of Aragon, by which his conquests were restored. For the remainder of his reign Henry's throne was secure, and he

John I

left the kingdom in peace to his son John I (1379–1390). The chief interest of the new reign centres round the relations with Portugal. The first renewal of the war was the work of the Portuguese king Ferdinand, who again supported the English claims upon Castile. But the alliance with England was not popular in Portugal, and in 1383 a treaty was concluded, which, however, proved productive rather of evil than of good. Beatrix, the only daughter of Ferdinand, was married to the Castilian king, and it was agreed that her children, whether male or female, should succeed to the throne of Portugal. A few months later Ferdinand died. Beatrix was at once proclaimed queen, and her mother undertook the regency. But the idea of union with Castile, which would involve the subordination of the smaller kingdom, was intensely unpopular at Lisbon. A rising overthrew the authority of the queen-mother, and the administration was entrusted to John, a brother of the late king. John of Castile at once entered Portugal to enforce what he considered to be the rights of his wife. But his high handed measures only added strength to the opposition, and made the new regent the leader of a national movement. In 1384 the Castilian forces laid siege to Lisbon, which held out with obstinate resolution for five months, when the besiegers retired. Exulting in their success, the Portuguese determined to have nothing more to do with Beatrix, and an assembly of the cortes gave the crown to the regent John. The Castilian king now made a determined effort to uphold his failing cause, but at the great battle of Aljubarrota (August 1385) his army suffered a crushing defeat. It was now the turn of the Portuguese to take the aggressive, and the arrival of John of Gaunt enabled them once more to take up his cause. It was only the aid of France and the dislike of the Castilians for the foreign-bred Constance and her husband that enabled John to make head against his numerous enemies. In 1387 he succeeded in terminating the English part of the quarrel. His eldest son Henry, the first heir to the crown who received the title of prince of Asturias, was betrothed to Catherine, daughter of Constance, in whose favour John of Gaunt renounced all claims on behalf of his wife (1387). The war with Portugal now sunk into a chronic struggle on the frontier, but was still going on when John I died in 1390.

Henry III

With the accession of Henry III (1390–1406), a boy of eleven, Castile was again face to face with the difficulties of a minority, and these were the more formidable on account of the absence of any prince of the blood-royal to assume the regency. By the will of the late king the administration was entrusted to a council to be formed by joint representation of the three estates. But the composition of this body was altered so as to give more power to the great nobles and prelates, and their quarrels soon involved the kingdom in the troubles of a civil war, from which it had been comparatively free in the last two reigns. Luckily for Castile, the young king, who assumed the government in 1393, showed himself to be a man of equal insight and resolution. By throwing himself boldly upon the support of the third estate, and by giving them the predominance in the cortes, he succeeded in taking efficient measures against the nobles. All domain-lands which had been alienated during his minority had to be restored, and all confederations among the barons were declared illegal and dissolved. The discontent which these measures provoked was promptly suppressed before it could develop into insurrection. At the same time the country enjoyed the blessings of external peace. Henry's marriage with Catherine of Lancaster secured him against hostilities not only from England but also from Portugal, whose queen was Catherine's sister. Unfortunately for the kingdom which he ruled with such wisdom and success, Henry III died in 1406 at the early age of twenty-seven, leaving an infant son to succeed him.

John II

The minority of John II was the most orderly period of his reign (1406–1454). The government was wielded by the able hands of his uncle Ferdinand, to whom the Castilians would have given the crown if he had been willing to supplant his nephew. Even after his accession to the throne of Aragon in 1412 he continued to give his advice to the queen-mother. The administration during these years was strong and orderly. The fortress of Antequera was taken from the Moors, and the Castilian nobles were kept in the same subjection as in the late reign. A new and disastrous period commenced in 1417, when the death of his mother transferred the reins of government to John II at the age of fourteen. Averse to the cares of business and absorbed in personal pleasures the young king was only too ready to allow himself to be guided by any one who would take the responsibility of rule upon his own shoulders. Before many years had elapsed he had fallen completely under the influence of Alvaro de Luna, grandmaster of the order of St James and constable of Castile. The minister, possessed of all the qualities which would have endowed a great monarch, set himself to increase the royal power. Not only were the nobles depressed to a condition of impotence which they had never yet experienced, but steps were also taken to diminish the powers of the third estate. Many of the lesser towns in Castile, as in England at the same period, found that the right of representation involved pecuniary burdens which they were eager to get rid of. This made it easy for the minister to reduce the number of towns sending deputies to the cortes to some seventeen or eighteen of the larger cities. This diminution of the third estate, though not resented, was an insidious blow at its real interests, and made it easy for Charles V and his successor to reduce the cortes to impotence. The arbitrary government of John II, which might have been endured if it had been really directed by the king himself, was intolerable to the nobles when it was known to be inspired by his minister. The reign is filled by a series of conspiracies, in which the domestic malcontents found powerful allies in John II's cousins, John and Henry of Aragon. But Alvaro de Luna was a warrior as well as a politician, and succeeded in foiling all direct attempts to effect his overthrow. His ultimate fall was due to the ingratitude of the king whom he had served too well. John's second wife, Isabella of Portugal, disgusted at the small amount of influence which the minister allowed her to exercise, set herself to effect his overthrow. Once deprived of the royal favour, Alvaro de Luna had no further support to rest upon. The very absolutism which he himself had built up was turned against him, and he was executed after a trial which was notoriously unfair. A year later John II followed him to the grave, and the crown passed to his son, Henry IV, the feeblest sovereign

Henry IV

that ruled in Castile before the 17th century. His mind was as feeble as his body, and the contempt of his subjects has fixed upon him the title of "The Impotent." His first favourite, the marquis of Villena, was supplanted, after Henry's marriage with Joanna of Portugal, by Beltran de la Cueva, whom scandal declared to be the queen's paramour. The birth of a daughter did nothing to check these rumours, and the unfortunate infanta was only known as "la Beltraneja." The government was not exactly oppressive, but it failed to command respect, and personal jealousies and ill-feeling were sufficient to produce a revolt. The leaders were the marquis of Villena

and Carillo, archbishop of Toledo, both of whom had objects of their own to serve In 1465 the rebellion broke out, and its first act was the formal deposition of Henry at Avila, after an absurd ceremony in which the king was represented by a puppet The conspirators denounced the infanta Joanna as illegitimate, and offered the crown to Henry's brother Alfonso In the course of the civil war which followed, Alfonso died (1468), and his partisans at once put forward the claims of his sister Isabella But the infanta, who already displayed a wisdom and moderation beyond her years, refused to be involved in hostilities with her elder brother, and she succeeded in arranging a treaty by which she was recognized as Henry IV's heiress The king himself struggled hard to evade these conditions, and after his death in 1474 Joanna's cause was espoused by her uncle, Alfonso

Isabella

V of Portugal But Isabella succeeded in securing her accession to the throne, and her marriage with Ferdinand of Aragon, by paving the way for the union of the two kingdoms, begins a new period in which for the first time there is a real history of united Spain

ARAGON (1213–1479) Constitution

The kingdom of Aragon which we left in the reign of James the Conqueror (1213–1276), consisted of the three provinces of Aragon, Catalonia, and Valencia Each province retained its own laws and institutions, and Valencia and Catalonia regarded with the keenest jealousy any attempt to govern them on the principles which prevailed in Aragon The powers of the crown were far more limited than in the neighbouring kingdom of Castile The great nobles, or *ricos hombres*, formed a small and exclusive class, whose privileges made them almost the equals of the monarch All conquests had to be divided between them, and the king was forbidden to confer a fief or honour upon any person outside their ranks They possessed and exercised the right of private war, and were entitled at will to renounce their allegiance to their sovereign The smallness of their numbers made them much more united than the nobles of Castile, and proportionately more formidable The difference between the two kingdoms was recognized by Ferdinand the Catholic with his usual acuteness when he said that "it was as difficult to divide the nobles of Aragon as it was to unite those of Castile" But the privileges of the nobles, great as they were, were not the only check upon the royal power Each province had its own cortes, which possessed from a very early date the right of granting taxes and approving legislation In Valencia and Catalonia the cortes consisted, as in Castile, of the ordinary three estates, but in Catalonia, where a maritime life had inspired the inhabitants with a passionate love of freedom, the commons enjoyed a predominance which was hardly to be paralleled in any other country in the Middle Ages The cortes of Aragon, which were more important, and whose history has been more carefully elucidated, consisted of four estates or arms (*brazos*) Besides the great prelates and the *ricos hombres*, both of whom had the right of appearing by proxy, there was a separate chamber of smaller landholders This contained the *infanzones*, or lesser tenants-in-chief, and the *caballeros* or knights, who were tenants of the greater barons but whose military rank gave them the right of personal attendance The fourth chamber alone was representative, and consisted of the deputies of the towns Their presence is first mentioned in 1133, thirty years before anything is heard of popular representation in Castile Their numbers were naturally small, as the kingdom was of very limited extent, but it seems to have been early established that a town which had once sent deputies was permanently entitled to the privilege, and this preserved them from having their rights tampered with by the crown as was done in Castile Besides their legislative and taxative functions, the Aragonese cortes were also a supreme court of justice, and in this capacity were presided over by the *justiciar*, an official whose unique powers have attracted the attention of all writers on Spanish history In its origin the office had nothing very remarkable about it, and it is only the peculiar circumstances of the kingdom which forced it into such prominence The justiciar was not at first entrusted with any political functions, but the difficulty of adjusting the relations between the king and the barons led to his being called in as mediator By the 14th century he had become almost the supreme arbiter in all constitutional questions To him the people could appeal against any infraction of their liberties, while the king regarded him as his chief councillor and as the most efficient barrier against armed rebellion, which was the only alternative method of settling disputes between his subjects and himself As the justiciar thus became the pivot of the constitution, it was of great importance to secure that he should exercise his functions with firmness and impartiality As the *ricos hombres* were exempted from corporal punishment, he was always chosen from the lesser nobles or knights, and was made responsible to the cortes under penalty of death The dignity of the office was enhanced by the character of its successive holders, and the mediæval history of Aragon abounds with instances of their fearless opposition to the crown and of their resolute resistance to despotism on the one hand and to anarchy on the other

The glorious reign of James (I) the Conqueror was disturbed towards its close by quarrels which arose from his scheme of partitioning his conquests among his children The death, however, of his youngest and favourite son put an end to these projects, and the most important of the provinces passed into the hands of Pedro

Pedro III.

III (1276–1285) Under Pedro and his son and successor Alfonso III (1285–1291), attention was almost wholly diverted from internal affairs to the conquest of Sicily By his marriage with Constance, the daughter of Manfred, Pedro could put forward a claim to succeed to the Hohenstaufen in Naples and Sicily, but it is not probable that he would have been able to make any use of the claim if the Sicilian Vespers (1283) had not thrown that island into his hands The result was a long series of wars with the Angevin rulers of Naples, but the hold upon Sicily was steadily retained These wars had a notable influence upon Aragonese history, as they compelled the kings to purchase the support of their subjects by concessions which could only with great difficulty have been extorted from them Thus in 1283 Pedro III granted the famous "General Privilege," the Magna Carta of Aragon By this the crown formally laid down a number of rules to secure all classes against oppression The General Privilege is quite as important a document as the English charter, it is even more full and precise, and its numerous confirmations show that it was as highly prized It had the additional advantage of being issued to a people already possessed of institutions sufficiently developed to employ and defend the national liberties But if Pedro's concessions were for the advantage of his country, his successor went to an extreme which was equally harmful

Alfonso III

In 1287 Alfonso III signed the famous "Privilege of Union," by which his subjects were formally authorized to take up arms against their sovereign if he attempted to infringe their liberties The right of revolt, while it is and must be the ultimate safeguard against oppression, becomes at once liable to abuse when it is formulated and discussed The act of 1287 gave an unlimited licence to disorder, which could always disguise itself under the pretence of defending liberty Until it was repealed

there was always a danger that the constitution would succumb, not to the tyrannical usurpations of the crown, but to the selfish interests of the nobles

James II On the death of Alfonso III the crown passed to his brother James II (1291–1327) The new king handed over Sicily to his younger brother Frederick, thus creating a separate dynasty in that island In the hope of depressing the greater barons, James II strengthened the hands of the justiciar and sought to conciliate the clergy and citizens to the crown By these steps he succeeded in avoiding any open conflict during his reign, and at the same time he sought to secure external unity by an edict which declared the three provinces of Aragon, Catalonia, and Valencia to be for ever indivisible (1319) But his **Alfonso IV** successor, Alfonso IV (1327–1336), did not hesitate to break this edict, in spirit if not in letter, by carving out great fiefs for his second wife, Eleanor of Castile, and her children By this measure he gave rise to the difficulties, **Pedro IV** and indirectly to the triumphs, of his son, Pedro IV (1336–1387) Pedro's reign is a great epoch in Aragonese history, as to him is due the arrest of the tendencies which threatened to divide and destroy the kingdom He began by recalling his father's excessive grants to his stepmother and his half-brothers The intervention of Alfonso XI of Castile on behalf of his sister failed to make any impression upon the king, and it was only the pressing danger from the Moors, which was removed in 1340 by the Castilian victory on the Salado, that induced him at last to consent to a compromise The same desire to unite all the possessions of the Aragonese crown is apparent in his treatment of the king of Majorca, James II, the descendant of James I's younger son, who had received from his father the Balearic Islands with Roussillon and Cerdagne as a vassal kingdom As James II showed inclination to evade his legal duties towards his suzerain, Pedro seized the first opportunity to pick a quarrel with him In 1344 all the territories of the king of Majorca were declared to be united to Aragon, and, though James II made an obstinate resistance, he met with little support from his former subjects, and the hopeless struggle was ended by his death in 1348

These high-handed measures not unnaturally excited the misgivings of the nobles of Aragon, whose privileges were not likely to be very scrupulously respected by a prince with such an obvious sense of his own rights and duties In 1347 chance gave them an eminent and capable leader There was no law against female succession in Aragon, and there was the precedent of Queen Petronilla in its favour On the other hand, there was a strong prejudice against it, and as a rule preference had been given to males, although further removed from the direct line Pedro IV had an only daughter, Constance, and he was eager to secure the succession to her in preference to his brother James, who was popularly regarded as the heir to the throne This unconcealed intention excited the indignation of James, who was already discontented at the harsh treatment of the king of Majorca He had no difficulty in inducing most of the chief nobles, including his half-brothers, to form a "Union," which was also joined by several of the towns in their discontent at the projected settlement of the succession (1347) Pedro was taken by surprise and could only gain time by concessions He promised to convoke annual meetings of the cortes, to choose his councillors with the approval of the estates, to revoke his will in favour of his daughter, and to recognize his brother as his heir Soon after this agreement, which left the Union master of the situation, James died, and men were not slow in attributing his death to the machinations of the king This event was of the greatest advantage to Pedro, as it deprived his opponents of their leader, and from this moment the rebellion began to be split up by personal rivalries The king and his advisers were not slow to avail themselves of the opportunity thus offered The opposition was strongest in Aragon and Valencia, and Pedro succeeded in gaining over the Catalonians, who were always prone to act in isolation from the other provinces With the troops thus acquired he met the army of the Union at Epila (1348) and won a complete victory He followed up his success by destroying all the charters which gave any sanction to armed resistance to the crown, and especially the Privilege of Union of 1287 His elder half-brother Ferdinand, who had succeeded James as leader of the revolt and as heir apparent to the throne, fled to Castile, but the chief nobles were severely punished, and the power of the crown was raised to a height which it had never before attained

Thus Aragon, following the tendencies of the age, became centralized under a powerful monarchy, and the forces of feudal disunion received a final check But Pedro IV was far from establishing anything like a despotism While destroying the Privilege of Union, he took a solemn oath to respect the political and personal liberties of his subjects, and enjoined the same oath upon his successors At the same time he strengthened the powers of the justiciar, whose pre-eminence dates from this reign The position of the king was immensely strengthened by the birth of a son, which destroyed the claims of his half-brothers The later part of his reign was occupied with a war against Henry II of Castile, which has been referred to above, and with resistance to James III of Majorca, who made an unsuccessful effort to recover the territories of his father Pedro concluded a second marriage with Sibilla, daughter of a Catalonian knight, and her influence involved him in a quarrel with his eldest son, whom he attempted to deprive of the office of lieutenant general, which custom assigned to the heir to the throne But he found that the authority of the justiciar was now strong enough to restrain the crown as well as the nobles Dominic de Cerda, who now held the office, pronounced that the infant was legally entitled to the dignity from which he had been ousted, and compelled the king to restore him The brief reign of John I **John I** (1387–1395) was mainly occupied with wars in Sicily and Sardinia The expense which these involved, which was increased by the luxury of a magnificent court, excited the most lively discontent on the part of the cortes The remonstrances of his subjects were resented by the king, but they were backed up by the authority of the justiciar, and John I gave way so far as to banish the unpopular favourites from the court On the king's death his daughters were passed over, and the crown was transferred to his brother Martin, who was occupied in restoring the **Martin.** Aragonese supremacy in Sicily Under Martin a private war between the great families of Urrea and Luna was put down, and the dependence of the great nobles was more firmly secured But the death in 1409 of the king's only son, Martin the younger, brought the kingdom face to face with the difficulty of a disputed succession There were two male claimants,—the count of Urgel, a great-grandson of Alfonso IV, and the duke of Gandia, a grandson of James II The former was the undoubted heir if the succession was absolutely limited to males, while the latter was advanced in years and could only bring forward the old contention of nearness to the royal stock But, although precedent was in favour of the exclusion of females, there was no definite rule to prevent the succession of their male descendants Of such claimants there were two,—Louis of Calabria, the son of John I's daughter Violante, and Ferdinand, infant of Castile, the son of Martin's sister Eleanor Moreover,

Martin the younger had left an illegitimate son, Frederick, count of Luna, and if the question had arisen a century earlier, before the clergy had obtained so much power, it is probable that his claims would have been preferred The question was still unsettled on the death of the elder Martin in 1410, with whom ended the male line of the counts of Barcelona A prolonged civil war seemed inevitable, and for two years the kingdom endured the evils of an interregnum If the dispute was to be settled by force of arms, the count of Urgel seemed likely to carry all before him, as he had the pretty unanimous support both of the Catalans and of the powerful family of Luna But his followers, confident in their superiority, allowed themselves to indulge in acts of violence which alienated the more orderly part of the population The justiciar, Juan de Cerda, who had acted with such impartial firmness in the reign of John I, succeeded in forming a patriotic party which determined to settle the dispute by a legal decision Jealousy of the De Lunas gave to this party the support of the rival house of Urrea They succeeded in procuring the appointment of a joint commission of nine members,—three from the cortes of each province After a careful examination of all the claims, the commissioners decided, on what principle it is difficult to determine, in favour of the infant Ferdinand, who was then acting as regent of Castile for his nephew John II (1412) As far as ability and merit went, the choice was probably the best that could have been made By mingled firmness and concession Ferdinand succeeded in restoring order and unity to the kingdom and its dependencies A revolt headed by the disappointed count of Urgel in the next year was suppressed, and its leader was punished with the confiscation of his territories and perpetual imprisonment

Ferdinand I

Thus the house of Trastamara succeeded in obtaining the crown of Aragon as well as that of Castile Ferdinand I, the first king of the new dynasty, did not live long to wield the sceptre which he had so fortunately acquired On his death in 1416 the crown passed to his son Alfonso V (1416–1458) The new prince played little part in Aragonese history, as his attention was almost wholly absorbed in the affairs of Italy To his inherited possessions of Sicily and Sardinia he added the kingdom of Naples after a seven years' contest with the Angevin claimant, René le Bon of Provence (1435–1442) From this time he never quitted his new kingdom, where his politic rule and his patronage of literature acquired for him the name of "The Magnanimous" During his absence the government of Aragon was entrusted to his brother John, as lieutenant-general The arbitrary character of this prince, which is so clearly visible in his subsequent history, seems to have been foreseen by his subjects In order to secure the justiciar from undue influence on the part of the crown, a law was made in 1442 that the office should be held for life, and that its occupant could only be dismissed by the king with the express approval of the cortes In 1461 this provision was followed up by another law which directed that all complaints against the justiciar should be heard before a commission regularly chosen from the four estates

Alfonso V

Relations of Aragon and Navarre

The history of John, both as regent for his brother and later as king in his own right, centres round the family quarrels which finally led to a formidable rebellion against him His first wife was Blanche, widow of Martin of Sicily and heiress of Navarre This little kingdom, which comprised territory on both sides of the Pyrenees, had been more closely connected with France than with Spain since its separation from Aragon on the death of Alfonso I (1134) In the 13th century it was united to the French crown by the marriage of Jeanne of Navarre with the French king, Philip IV, but it again became independent on the death of Louis X in 1315 His daughter Jeanne was the undoubted heiress of Navarre, and, though she was kept out of her rights by her uncles, Philip V and Charles IV, she was allowed to succeed after their death In 1329 she was crowned at Pamplona with her husband, Philip of Evreux Her son, Charles the Bad (1349–1387), obtained an unenviable notoriety for the part which he played in French history during the troublous period of the English wars His son, Charles III (1387–1425), was a peace-loving prince, who devoted more attention to art and literature than to politics The marriage of his daughter Blanche with John of Aragon brought the mountain kingdom once more into close connexion with the western peninsula By her marriage contract, Navarre was to pass on her death to her children and not to her husband, but a later agreement enjoined her son, before assuming the sovereignty, to obtain "the goodwill and approbation of his father" When Blanche died in 1442, John seems to have considered that this later stipulation justified him in retaining the title of king of Navarre, though he entrusted the administration of the kingdom to his son, Charles of Viana For some time no difficulty was made about this arrangement But in 1447 John married a second wife, Joanna Henriquez, a descendant of the royal family of Castile, and a few years later he sent Joanna to share the government of Navarre with his son This appointment, coupled with the arrogant conduct of his stepmother, was regarded as an insult by Charles of Viana, who was not slow to remember that by right he was entitled to the crown The old parties of Navarre, the Beaumonts and Agramonts, seized the opportunity to renew their feuds,—the former espousing the cause of the prince, the latter that of the queen Before long the dispute developed into civil war, and John marched into Navarre to assist his wife, who was besieged in Estella by her stepson At Aybar the hostile forces met in open conflict, but the superior discipline of the royal troops gave them a complete victory, and Charles fell a prisoner into his father's hands (1452) The prince was released after a short imprisonment, but the reconciliation was only a hollow one The birth of a son to Joanna Henriquez (1452), afterwards famous as Ferdinand the Catholic, was a serious blow to the interests of the elder son The queen scarcely concealed her desire to secure the succession to her own child, and her influence over her husband was unbounded Charles found that his defeat had given the supremacy in Navarre to the hostile party, and after a vain attempt to recover his power he went to Naples to appeal to his uncle Alfonso V But his hopes in this quarter were destroyed by Alfonso's death in 1458 Of his possessions, Aragon, Sicily, and Sardinia passed to his brother John II, while Naples, as a private acquisition of his own, was bequeathed to his natural son Ferdinand The Neapolitan barons, dreading the gloomy and tyrannical character of their new ruler, offered to support Charles of Viana as a candidate for the throne, but he refused to oppose his cousin, and retired to Sicily, where he spent the next two years in seclusion In 1460 he was induced to return by the solicitations of his father, who seems to have been disquieted by the popularity which the prince had obtained among the Sicilians The intrigues of Joanna were not long in exciting the old mistrust between father and son, and her hostility towards Charles was increased by his attempts to obtain the hand of Isabella of Castile, whom she had already fixed upon as a suitable bride for her own son Ferdinand In 1461 Charles was induced to meet his father at Lerida, and was at once imprisoned When asked about the cause of this arbitrary proceeding, John

John II.

only replied with obscure hints at a conspiracy. But his subjects were not prepared to acquiesce in this unnatural treatment of a prince whom they had learned to love and whom they regarded as their future ruler. The Catalans, always easily moved, rose in arms and marched upon Lerida, and it was only by a hasty retreat that John was able to escape with his court to Saragossa. But the revolt speedily spread from Catalonia to the other provinces, and even to Sicily and Sardinia, while it found supporters in the king of Castile and in the faction of the Beaumonts in Navarre. Surrounded by enemies, John II found it necessary to yield. He not only released his son, professing that he did so at his wife's request, but appointed him lieutenant-general of Catalonia and promised not to enter that province without the permission of the cortes. But no sooner had Charles of Viana regained his liberty than he died, on September 23, 1461, and the circumstances led ready credence to be given to the suspicion that he had been poisoned during his captivity.

The crown of Navarre now devolved by right upon Charles's elder sister Blanche, who had been married to and afterwards repudiated by Henry IV of Castile. But she had incurred her father's enmity by the support which she had given to her brother, and John II was not unwilling to curry favour with France by securing Navarre to his second daughter Eleanor of Foix, whose son Gaston had married a sister of Louis XI. The unfortunate Blanche was committed to the guardianship of her younger sister, and after two years of imprisonment in the castle of Orthez she died of poison. But Eleanor reaped little advantage from the crime which all historians impute to her. Her father retained the crown of Navarre till his death, and she only survived him a few weeks. She was succeeded by her grandson Francis Phœbus, but he only lived for four years, and his sister and heiress Catherine brought the crown of Navarre by her marriage to the French house of D'Albret, from which it was wrested by Ferdinand the Catholic in 1512. This third union with Aragon proved permanent, although the district north of the Pyrenees was subsequently annexed to France.

Meanwhile the troubles of John II were by no means removed by his son's death. In Aragon the young Ferdinand was acknowledged as heir, and was then sent with his mother to Catalonia to receive the oath of allegiance from that province. But the Catalans rose again in rebellion, and besieged Joanna and her son in the fortress of Gerona. As John II was unable to advance through the revolted province to his wife's relief, he purchased the assistance of Louis XI by a promise of 200,000 gold crowns, as security for which he pledged the counties of Roussillon and Cerdagne (1462). The Catalans replied to this alliance by throwing off their allegiance to John and proclaiming a republic. As, however, Gerona was relieved by the French, and the royal troops succeeded in reducing several of the chief towns, they determined to appeal for foreign aid. The crown was offered first to Henry IV of Castile and then to the constable of Portugal, who was descended from the old counts of Barcelona. On the death of the latter in 1466 the rebels turned to the traditional rivals of the house of Aragon, and offered the crown to René le Bon, the head of the Angevin house. René, whose life had been spent in putting forward claims which he had never been able to enforce, accepted the offer and sent his chivalrous son John of Calabria to assist the Catalans (1467). John II's fortunes were now at their nadir. He had lost his eyesight, and the death of his wife in 1468 deprived him of the companion and adviser who had for years directed and inspired his policy. John of Calabria, whose enterprise was secretly encouraged by the treacherous king of France, was steadily regaining much of the ground which had been lost by the Catalans before his arrival. But the old king, whose sight was restored by a surgical operation, fought on with a dogged obstinacy worthy of a better cause. The death of the duke of Calabria in 1469 deprived his opponents of their leader, and from this moment their ultimate defeat was inevitable. The fall of Barcelona (1472) completed the reduction of Catalonia. But John did not venture to abuse the victory which he had so hardly won. He granted a general amnesty, and took a solemn oath to respect the constitution and liberties of the conquered province. The only notable event of the remaining years of John II's reign was an attempt to recover Roussillon and Cerdagne. But Louis XI kept a firm hold by arms upon the provinces which his diplomacy had won, and they were only restored to Aragon in 1493 when Charles VIII ceded them to Ferdinand the Catholic. In 1479 the death of John II, at the ripe age of eighty-two, transferred the crown to his son Ferdinand, who ten years before had concluded his marriage with Isabella of Castile. Ferdinand the Catholic.

Literature.—Lafuente, *Historia General de España*, Ortiz, *Compendio General de la Historia de España*, Mariana, *Historia General de España*, Lembke, Schafer, and Schirrmacher, *Geschichte von Spanien* (down to 1295), Dozy, *Histoire des Musulmans d'Espagne* (to 1110), Desormeaux, *Abregé Chronologique de l'Histoire d'Espagne*. For the constitutional history the chief books of reference are—for Castile, Marina, *Teoria de las Cortes*, and Sempère, *Histoire des Cortes d'Espagne*, and for Aragon, Blancas, *Commentarii Rerum Aragonensium*, but a fair summary of their conclusions may be found in chapter iv of Hallam's *Middle Ages* and in the introduction to Prescott's *Ferdinand and Isabella*. The history of the Castilian cortes has been recently elucidated by Don Manuel Colmeiro in his *Cortes de los Antiguos Reinos de Leon y de Castilla* (Madrid, 1883). The chief mediæval chroniclers may be found, though not well edited, in Florez, *España Sagrada*, and Schott, *Hispania Illustrata*. (R. L.)

Section IV.—Modern History

The history of Spain as a united state dates from the union of Castile and Aragon by the marriage of Isabella and Ferdinand. The marriage took place in 1469, before the accession of either sovereign. In 1474 the crown of Castile was claimed by Isabella on the death of her brother Henry IV, whose daughter Joanna was universally believed to be illegitimate. It was contended by the partisans of Ferdinand that female succession was prohibited in Castile, and that he was entitled to the crown as the nearest male heir after his father. Ultimately the question was settled in Isabella's favour, and she obtained the most important rights of sovereignty, though the government was carried on in their joint names. It is possible that Ferdinand would have refused to accept this arrangement, if concerted action had not been necessary to oppose the party which espoused the cause of Joanna. A number of the Castilian nobles, headed by the marquis of Villena, dreaded the danger to the privileges of their order that might arise from the establishment of a strong government. They found an ally in Alfonso V of Portugal, who was Joanna's uncle by the mother's side, and who cherished the design of obtaining the Castilian throne by a marriage with his niece. In 1476 the confederates were routed in the battle of Toro, and Alfonso departed to France with the chimerical plan of seeking assistance from Louis XI. The treaty of St Jean de Luz between France and Castile in 1478 ruined these hopes, and in the next year Alfonso was compelled, by the treaty of Lisbon, to abandon the cause of his niece. This terminated the war of succession in Castile, and Joanna, known from her reputed father as La Beltraneja, retired into a convent. A few months before the treaty of Lisbon the death of John II (January 20, 1479) gave to Ferdinand the succession to Aragon, Sicily, and Sardinia. Navarre, which had been brought Ferdinand and Isabella.

to John II by his first wife, passed to his daughter by that marriage, Eleanor, countess of Foix Two provinces of the Aragonese crown, Roussillon and Cerdagne, had been pledged by John to Louis XI of France, and were still retained by that monarch The union of Castile and Aragon effected in 1479 was merely a personal union Each province retained its own institutions and its own laws, and each would have resented the idea of absorption in the other

Administrative reforms. The first care of the two sovereigns was to reform the system of government, especially in Castile, where the recent civil wars had given rise to serious disorders One of their chief objects was to depress the nobles, whose privileges, acquired during the long struggle against the Moors, were inconsistent with a strong centralized government In accordance with true policy and with the spirit of the age Ferdinand and Isabella sought to counterbalance the nobles by relying upon the burgher class The *Santa Hermandad*, or Holy Brotherhood, which was organized in 1476, was a popular confederation of the whole kingdom for police and judicial purposes Its affairs were managed by local courts,—from which appeals could be made to a supreme tribunal,—and by a general junta composed of deputies from all cities, which was convened once a year A body of 2000 cavalry was at the disposal of the association, and a special code of laws for its guidance was compiled in 1485 The institution was completely successful in maintaining order and in diminishing the independence of the local jurisdiction of the great nobles About the same time the lavish grants from the royal domain, which had enriched the nobles at the expense of the crown, were revoked, the central judicial courts were made more efficient by the introduction of trained lawyers, and steps were taken to codify the numerous laws that had been made since the *Siete Partidas* of Alfonso X The grandmasterships of the great orders of St Iago, Calatrava, and Alcantara, which conferred powers too great to be entrusted to a subject, were on successive vacancies secured to the crown Trade was encouraged by protective measures, by the breaking down of the barriers between Castile and Aragon, by a strict reform of the currency, and by the commutation for a fixed impost of the detested *alcavala*, a tax of one-tenth upon all sales and transfers of property

The increased prosperity of the country is well illustrated by the steady rise of the revenue "In 1474, the year of Isabella's accession, the ordinary rents of the Castilian crown amounted to 885,000 reals, in 1477 to 2,390,078, in 1482, after the resumption of the royal grants, to 12,711,591, and finally, in 1504, when the acquisition of Granada and the domestic tranquillity of the kingdom had encouraged the free expansion of all its resources, to 26,283,334, or thirty times the amount received at her accession All this was derived from the customary established taxes, without the imposition of a single new one" (Prescott, ii 575) No attack was made upon the liberties of the subjects; the cortes of Castile were frequently convened, the same towns were called upon to send deputies, and the only innovation was the frequent neglect to summon the nobles The numerous *pragmaticas*, or royal ordinances, were mostly limited to administrative matters or to the interpretation of the law The credit for the domestic administration rests mainly with Isabella Ferdinand busied himself more with military and diplomatic affairs, and comparatively few innovations were made in Aragon The *Hermandad* was introduced, and in some other points the example of Castile was followed But the advanced constitutional liberties of Aragon were uncongenial to Ferdinand He summoned the cortes as rarely as possible, and when that assembly met he spared no pains to influence its composition and its decisions The centralizing tendencies of the reign were carried still further in both provinces in the later period when Ximenes, who became archbishop of Toledo in 1495, exercised the chief influence Five councils were entrusted with the administration of affairs —the "royal council," the chief court of justice, the "council of the supreme" for ecclesiastical business, the "council of the orders" for the great military fraternities, the "council of Aragon" for the management of that kingdom and of Naples, and the "council of the Indies" for the great discoveries of Columbus and his companions

Religious unity. The political unity of Spain was to be based upon its religious unity Both Ferdinand and Isabella were imbued with that stern spirit of orthodoxy with which the Spaniards were inspired by their long crusade against the infidel No institution of their reign was so important as the Inquisition, which was authorized by a bull of Sixtus IV in 1478, and constituted for the two kingdoms in 1483 under the presidency of Torquemada Its extension to Aragon was bitterly protested against by the liberty-loving people, but was forced upon them by the iron will of Ferdinand The activity of the Holy Office was at first directed against the Jews, whose obstinate adherence to their faith in spite of persecution was punished by an edict for their expulsion in 1492 Their departure deprived Spain of many industrious inhabitants, but its importance has been much exaggerated by authors who have failed to notice that it was followed, not by the decline of Spain, but by the period of its greatest prosperity In spite of their orthodoxy, however, Ferdinand and Isabella were by no means slavish adherents of the papacy The claim of the popes to appoint to important benefices was strenuously resisted, and the chief control of ecclesiastical affairs was successfully vindicated for the crown

The steady extension of the royal power in Spain was due in no small degree, as Machiavelli has pointed out, to the constant succession of enterprises in which the attention of the nobles was absorbed. These enterprises may be summarized under three heads —(1) the union of the Peninsula, (2) the extension of colonial empire, and (3) the acquisition of foreign territories

Union of the Peninsula. (1) Under the first head the most important achievement was the final extinction of the Moorish power in Spain The war which began in 1481 was carried on in a desultory manner for ten years, and was completed in 1492 by the conquest of Granada The Moors, who had fought with the courage of despair, received very lenient terms from their conquerors They were secured in the free exercise of their religion, and were allowed to retain their own laws, customs, and language In some points, such as the trade with Africa, they obtained privileges which were not even shared by the Castilians But the spirit of proselytism was too strong in Spain to allow this treaty to be observed The measures taken by Ximenes to bring about the conversion of the Moors provoked a revolt in 1500, which was put down with great severity They were compelled to choose between conversion or banishment, and, although most of them accepted the former alternative, the Moriscoes, as they were now called, found themselves henceforward in the hopeless position of a proscribed and hated minority In 1493 Ferdinand extorted from the fears and hopes of Charles VIII of France the restoration of Roussillon and Cerdagne by the treaty of Barcelona In 1512, after Isabella's death, he annexed Navarre. The whole Peninsula was now united, with the exception of Portugal, and steps had been taken for the acquisition of that kingdom by marriage Isabella, Ferdinand's eldest daughter, was married to Alfonso, the son and heir of

John II of Portugal After the death of that prince his widow married Emanuel, who succeeded to the Portuguese crown in 1495 Isabella herself died in giving birth to a son, but the connexion was still maintained by the marriage of Emanuel to her younger sister Mary The fruits of this persistent policy were not reaped, however, till the reign of Philip II

Colonial empire

(2) Maritime discovery was the task of the age, a task forced upon it by the Turkish occupation of the Levant, which had closed the old commercial routes to the East The foremost pioneers in the work were the Portuguese and Spaniards, whose efforts brought them into rivalry with each other The treaty of Lisbon in 1479 secured the western coast of Africa to Portugal, but enabled Spain to complete the annexation of the Canaries The Spaniards now turned further westwards, and a wholly new problem was created by Columbus's discovery of the West Indies in 1492 His voyage had been undertaken under the patronage of Isabella, and the new territories were regarded as pertaining to Castile To solve any difficulties that might arise, a bull was obtained from Alexander VI in 1493, which granted to Spain all discoveries west of an imaginary line drawn 100 leagues to the west of the Azores and the Cape Verd Islands As this arrangement excited Portuguese discontent, it was modified by a treaty at Tordesillas in 1494, which removed the boundary line to 370 leagues west of the Cape Verd Islands This modification had important results for the Portuguese, as giving them their subsequent claim to Brazil In the meanwhile Spain redoubled its exertions In 1498 Columbus landed on the continent of South America, and in a few years the whole western coast was explored by subsequent adventurers In 1512 Ponce de Leon discovered Florida, and in the next year Balboa crossed the Isthmus of Darien and gazed for the first time upon the Pacific No exertions were spared by the Government to encourage settlement in its new territories, but the regulations of colonial trade, and especially the provision that it should pass through the single port of Seville, were conceived in a narrow and selfish spirit which prevented the full development of their resources

Acquisition of Naples

(3) The foreign affairs of the reign, which were almost wholly connected with Italy, were conducted by Ferdinand on behalf of Aragon, just as the extension of the colonies was directed for the benefit of Castile Charles VIII's invasion of Naples, which was ruled by an illegitimate branch of the house of Aragon, was undertaken in the full belief that the support or at least the neutrality of Spain was secured by the treaty of Barcelona But Ferdinand, jealous of the rapid success of the French, seized the first pretext to disregard the treaty, and became a member of the league which was formed at Venice in 1495 against Charles His troops, under the famous Gonsalvo de Cordova, took a prominent part in restoring Ferdinand II to the Neapolitan throne With the accession of Louis XII came a great change in Ferdinand's policy, and he determined to advance the claim to Naples which he himself possessed as the legitimate head of the Aragonese house By the treaty of Granada in 1500 Naples was to be divided between France and Spain, and the reigning king Frederick could make no resistance to such overwhelming forces But a quarrel naturally arose about the terms of the partition, and by 1504 Gonsalvo de Cordova succeeded in expelling the French from Naples, which was henceforth annexed to the crown of Aragon

Death of Isabella.

In 1504 the unity of Spain was interrupted for a time by the death of Isabella The successive deaths of the infant John (1497), of Isabella of Portugal (1498), and of her infant son Miguel (1500) had left the succession in Castile to the second daughter, Joanna, she was married to the archduke Philip, son of Maximilian I, and ruler, through his mother Mary of Burgundy, of the Netherlands and Franche-Comte Unfortunately Joanna, who was the mother of two sons, Charles and Ferdinand, had already given signs of that insanity which was to cloud the whole of her subsequent career Philip, who had visited Spain in 1502, had then excited the distrust of his wife's parents, and Isabella by her will left the regency in Castile to her husband until the majority of their grandson Charles But Ferdinand, in spite of his brilliant successes, was not popular among the Castilian nobles, who seized the opportunity to support the more natural claims of Philip to govern on behalf of his wife Ferdinand showed his disgust by actions which threatened to undo all the previous objects of his policy He concluded a treaty with Louis XII in 1505, by which he undertook to marry the French king's niece, Germaine de Foix To her Louis resigned his claims upon Naples, but in case of her death without issue his share in the kingdom by the treaty of Granada was to revert to France Thus Ferdinand was willing to gratify his spite and to perpetuate the division between Aragon and Castile, under the penalty of forfeiting his recent conquests in Italy His second marriage was concluded in March 1506, and two months later he resigned the regency in Castile to Philip, and soon afterwards sailed to Naples

But the division of the Peninsula was not destined to last long On September 25 Philip died at the age of twenty-eight, and the devotion of Ximenes secured the restoration of the regency to Ferdinand Joanna, who had been devotedly attached to her husband, lost all semblance of reason after his death, and made no attempt to exercise any influence over the conduct of affairs The remaining part of Ferdinand's reign is uneventful in the history of Spain The government was carried on on the same system, but with more avowed absolutism, as during the lifetime of Isabella Ximenes, whose energies found insufficient occupation in the compilation of his Polyglott Bible and in the foundation of the university of Alcala de Henares, fitted out and headed an expedition to Oran in 1509, which resulted in extensive but short-lived conquests in northern Africa Ferdinand threw himself with more energy than ever into the current of European politics By joining the league of Cambray he wrested from Venice five important towns in Apulia which had been pawned to the republic by Ferdinand II As a member of the Holy League against France he succeeded in conquering Navarre in 1512 Navarre had passed to the French family of Albret by the marriage of Catharine de Foix with Jean d'Albret, and it was the close connexion with France which gave Ferdinand a pretext for its invasion In 1515 his new conquest was formally incorporated with the kingdom of Castile This was Ferdinand's last success, and he died on January 23, 1516 His will recognized Joanna as his heiress in Aragon, and his grandson Charles as the regent in both kingdoms Until his arrival, the administration of Castile was entrusted to Cardinal Ximenes and that of Aragon to his own natural son, the archbishop of Saragossa

Death of Ferdinand.

Hapsburg rule (1516–1700)

With the death of Ferdinand begins the period of uninterrupted Hapsburg rule in Spain, which lasted for nearly two centuries In the course of this period the monarchy obtained absolute authority, and Spain, after rising for a time to be the foremost state in Europe, sank to the position of a second-rate power, from which it has never since emerged At first the condition of affairs was by no means promising for the crown The unity of Spain, which had advanced with such rapid strides after the marriage of Ferdinand and Isabella, had been seriously shaken by the selfish policy pursued by the king since his

wife's death. Aragon and Castile were distinct kingdoms, and the former was again divided into the three provinces of Aragon, Catalonia, and Valencia, each of which had its own cortes, its own privileges, and the most warmly-cherished traditions of independence. Classes were everywhere divided against each other, and within each class jealousies and quarrels were frequent. The foreign possessions of the two crowns were a source of weakness rather than of strength. France stood ready at the earliest opportunity to contest the possession of Navarre with Castile, and that of Naples with Aragon.

Charles I (emperor Charles V.)

The difficulties of domestic government were increased by the fact that the prospective ruler was a youthful foreigner, who had never visited Spain, and who was completely ignorant of the customs and even of the language of the country. Charles had been born and educated in the Netherlands, of which he had been nominal ruler ever since the death of his father in 1506. All his friends and advisers were Flemings, who cared nothing for Spanish interests and had already acquired an evil reputation for selfish greed. The first symptom of discontent in Spain was excited by Charles's demand to be recognized as king, in utter disregard of his unfortunate mother. In Aragon the demand was unhesitatingly refused, but in Castile the vigorous measures of Ximenes secured Charles's proclamation. The regent, however, had great difficulties to face. The nobles, delighted to be rid of the strong government of Ferdinand, wished to utilize the opportunity to regain the privileges and independence they had lost. In this crisis the loyal devotion of Ximenes saved the monarchy. Throwing himself upon the support of the citizen class, he organized a militia which overawed the nobles and maintained order. A French invasion of Navarre was repulsed, and to avoid any danger from the discontent of the inhabitants all the fortresses of the province, with the single exception of Pamplona, were dismantled. These distinguished services were rewarded with more than royal ingratitude by Charles, who came to Spain in 1517, and who allowed the aged cardinal to die on November 8 without even granting him an interview.

The young king soon felt the loss of so able and experienced an adviser. His Flemish ministers, with Chièvres at their head, regarded Spain as a rich booty to be plundered at will. The Castilians, the proudest nation in Europe, found all the places of honour and profit seized by greedy foreigners. The cortes had shown their loyalty by acknowledging Charles as joint-king with his mother and by granting him an unprecedented service of 600,000 ducats. But they had accompanied their grants with eighty-eight significant demands, which the young king accepted but made no pretence of fulfilling. In Aragon and Catalonia more difficulty was experienced. Nearly two years were wasted in obtaining the recognition of the royal title, and no supplies were forthcoming. Valencia was not visited at all, and the attempt to induce the people to do homage to a viceroy was a failure. A civil war broke out in the province between the privileged nobles and a *germandada*, or brotherhood, of the burgher class. The Government exasperated parties by supporting each in turn, but ultimately threw in its lot with the nobles.

Meanwhile the death of Maximilian had given Charles the succession to the considerable Hapsburg territories in Germany, and in 1519 the German electors had chosen him to be king of the Romans. He was now the first prince in Europe, and it was necessary for him to leave Spain to look after his interests in Germany and to cement there alliances which he needed against the inevitable hostility of France. But his elevation by no means increased his popularity in Castile. The Castilians had already plenty of grounds for complaint in the rapacity of the Flemings and in Charles's failure to perform his promises to the cortes. But these were as nothing compared with the prospect that Castile might no longer be the primary state of their king, and that their revenues might be employed in the attainment of objects in which they had not the slightest interest. While opinions were thus excited, Charles, who had been reduced to great straits by his military preparations and his promises to the German electors, summoned the cortes to meet at Santiago (Compostella) in Galicia, and thence transferred them to Coruña in order to embark as soon as he had obtained the supplies he needed. The place of meeting was carefully chosen so as to isolate the assembly and to expose it to royal influence or intimidation. The lead of the opposition was taken by Toledo, which refused to send its two deputies, as being too favourable to the crown, but sent other representatives to remonstrate with Charles and to encourage the other cities. They were driven from Coruña, and the deputies of Salamanca were excluded from the cortes. By these and similar means the desired grant was extorted. Charles hastened to quit Spain with the first favourable wind, leaving Adrian of Utrecht as regent in Castile, and two native nobles in Aragon and Catalonia. His departure was really necessary for his other interests, but it must have seemed reckless to the Spaniards at a time when Valencia was in the flames of civil war and Castile was on the verge of rebellion. Before starting he had ordered the removal of the magistrates of Toledo, and had sent a new governor to reduce the city to obedience. The citizens, headed by a young noble, Juan de Padilla, resisted this order and raised the standard of insurrection. Other cities hastened to join the movement, and a central committee, known as the "Holy Junta," established itself at Avila. The unfortunate regent, a churchman of distinguished piety and gentle character, found himself face to face with difficulties that would have taxed all the resources of Ximenes. His attempt to reduce Segovia by arms was a lamentable failure, and he had to confess his utter defeat by disbanding his forces. The nobles, alienated by the appointment of a foreigner to the regency, made no attempt to check a movement against a Government they detested. The insurgents had matters their own way, and Padilla, advancing to Tordesillas, made himself master of the person of Joanna, in whose name it was intended to conduct the government. But this move was less advantageous than it at first appeared. Joanna refused to transact any business or to sign any document, and this public proof of her incapacity served to justify Charles's contention that he was the only possible ruler. The Castilians were not prepared to get rid of the monarchy, so that it was necessary for the rebels to consider the possibility of coming to terms with Charles. The "Holy Junta," which had moved from Avila to Tordesillas, drew up a series of demands, which, if acceded to, would have established a constitutional monarchy in Spain. But their envoys to Germany found it impossible even to secure an audience from the king, and meanwhile the failure of the insurrection was decided. The very ease with which the rebels had triumphed proved an evil, because it encouraged internal dissensions which opposition might have healed. Especially Burgos showed its jealousy of the leading position which had been assumed by Toledo. Class differences, the bane of every country in the Middle Ages, supplied the final stumbling-block. Many of the demands of the communes were diametrically opposed to the interests of the nobles, whose eyes were at last opened to the danger of their attitude of neutrality. Their chief grievance had been removed by Charles's appointment of

Rising of the communes

the admiral and constable of Castile as joint-regents with Adrian An army was raised, and on the field of Villalar the forces of the communes were utterly defeated (April 23, 1522) Padilla, who had shown more enthusiasm than ability, was executed, and one city after another was reduced to submission A portion of the victorious army was sent to the assistance of the nobles in Valencia, where the *germandada* was at last crushed The return of Charles to Spain in June 1522 completed the triumph of the monarchy In 1523 he convened the Castilian cortes, and compelled them to grant supplies before presenting their petitions for redress, thus establishing a precedent which was conclusive for the future

Charles's reign belongs to the history of Europe rather than to that of Spain, and has been sufficiently treated elsewhere (see CHARLES V) His enormous inheritance was increased by the successes of Cortes in Mexico and of Pizarro in Peru, by his own annexation of the Milanese, and by his conquests in northern Africa In the government of this vast empire Spain played an important but on the whole a subordinate part Its soldiers and its subsidies were Charles's most effective weapons, and to render them more readily available it was necessary to depress still further the liberties of the country The independence of the towns had been crushed at Villalar, but only by the intervention of the nobles, and these had now to pay the penalty of their selfish loyalty In 1538, after Charles had for a time concluded his struggle with France by the truce of Nice, he proposed to raise supplies in Castile by an excise upon commodities The nobles objected on the ground of their exemption from taxation, and the emperor had to give way But he took his revenge by excluding them altogether from the cortes, which henceforth consisted only of thirty-six deputies from eighteen towns, a body that was powerless to oppose the wishes of the crown

The vast enterprises in which Charles was involved exhausted his energies, and the failure of his policy in Germany reduced him to despair In 1555–56 he resigned all his dignities, and ended his life in 1558 in retirement at Yuste From this time the house of Hapsburg is divided into the two branches of Spain and Austria Charles's brother Ferdinand became king of the Romans and obtained the German territories of the family, to which he had added the crowns of Bohemia and Hungary Philip II, Charles's only legitimate son, succeeded to the Spanish and Burgundian inheritance, with the addition of Milan

Philip II

Philip II, like his father, played a great part in European history (see PHILIP II), but with this important difference that Castile was definitely the central point of his monarchy, and that his policy was absolutely directed by Spanish interests In character and education he was a Spaniard of the Spaniards, and after 1559 he never quitted Spain He gave the country a capital, which it had never yet possessed, by fixing his residence at Madrid Castile, under the direct supervision of the king, was subjected to the most crushing despotism Aragon, Catalonia, and Valencia were governed as mere provinces, in the same manner as Milan, Naples, and Sicily The continuance of the old divisions of the country, while it lessened its strength, was an immense advantage to the royal power It was easy for the king to employ the forces of one province to crush the liberties of the others And Philip possessed a formidable weapon in the Inquisition, which he did not scruple to use for secular purposes Political independence was crushed with the same relentless severity as religious dissent Hitherto Aragon had preserved its mediæval privileges almost intact The king was not entitled to the allegiance of the province until he had solemnly sworn to observe its "fueros" For the decisions of the cortes unanimity was required, so that each deputy had a practical right of veto The authority of the justiciar rivalled that of the crown It was natural that Philip should seize the first opportunity of attacking institutions which could thwart his will In 1590 Antonio Perez (see PEREZ), a minister who had incurred the king's displeasure, fled to Aragon and appealed to its fueros for protection Philip had him brought before the Inquisition, and when the people rose in defence of their liberties they were crushed by troops from Castile The justiciar was put to death, and his successors became nominees of the crown The cortes were assembled in 1591 at Tarragona, and compelled to abolish the most obnoxious fueros Their control over the judicial administration was abrogated, and the necessity of unanimity was only retained in certain specified cases, notably the granting of supplies To avoid any danger from the few privileges that were left, a citadel was built in Saragossa for the reception of a royal garrison The creation of a regular standing army completed the edifice of absolutism, while the militia which had been established by Ximenes was retained and extended for the suppression of local disorders

Philip's internal administration was everywhere successful in obtaining the objects which he set before himself A rising of the Moors in the Alpujarras was crushed by the military ability of his famous half-brother, Don John of Austria In 1580 a claim to the crown of Portugal, which Philip derived from his mother, was successfully asserted Thus the unity of the Peninsula was at last completed, while the colonial territories of Spain were immensely extended Unfortunately, no attempt was made to conciliate the Portuguese to their new ruler The kingdom was treated as a conquered province, all who had resisted the Spanish invasion were punished as traitors, the native nobles were excluded from all share in the government, which was entrusted solely to Spaniards, the commerce of the country was ruined by provisions which conferred a practical monopoly upon Spain The result of this short-sighted policy was that the Portuguese stifled their discontent, and eagerly awaited the first opening for the recovery of their independence

Outside Spain Philip's policy proved a complete failure His religious intolerance excited the revolt of the Netherlands, which ended in the loss of the seven northern provinces His grand schemes against England were utterly ruined by the destruction of the Spanish Armada And, finally, his endeavour to establish a preponderant Spanish influence over France was foiled by the accession and triumph of Henry IV The treaty of Vervins, by which he acknowledged his humiliating defeat, was almost the last act of Philip II's reign, which ended with his death on September 13, 1598

Philip II left to his son and successor, Philip III, an empire which was nominally undiminished, as the independence of the United Provinces had never been recognized, and the war for their reduction was still going on But the unwieldy mass was suffering from internal exhaustion The resources of Spain and the New World had been squandered in the prosecution of schemes of ambition which had ended in failure The attention of the people had been distracted from peaceful industry to the unprofitable occupation of war The soldiery of Spain, once reckoned invincible, had lost their prestige in the marshes of Holland The enormous taxes, from which nobles and clergy were exempted, fell with ruinous severity upon the productive classes Castile had suffered most, because it was most completely subject The provinces which retained their liberties longest were more prosperous, even though they had no share in the riches that were poured into Castile from the western colonies But they,

too, had suffered from the king's reckless ambition and from an economic policy which followed the most glaring errors of the Middle Ages Every other consideration had been sacrificed to the accumulation of specie, with the result that prices were forced up to an abnormal height, while the wealth of the country bore no proportion to the currency The nobles were carefully excluded from all political affairs and ceased to take the slightest interest in the administration When this exclusion came to an end after Philip II's death, they appear as mere courtiers, rivalling each other in the extravagance of their expenditure, but contributing nothing to the efficiency of the state The government had been centralized by successive kings, but it was carried on without either wisdom or impartiality The administration of justice was venal and incompetent The people had been deprived of their liberties, but they failed to receive compensation in increased order and security Spain had to pay dearly for its short period of glory Its rapid decline in the 17th century was the inevitable penalty for the faults and errors of the 16th

Philip III "God," said Philip II, "who has been gracious in giving me so many states, has not given me an heir capable of governing them" His successor was the natural product of his father's system the exhaustion of Spain was inevitably accompanied by the degeneracy of its rulers Philip III, who was twenty-one years old at his accession, had been brought up among priests and women, and showed all the defects of his education Spanish writers are never weary of dilating upon his piety and his devotion. The cares of government he left entirely to his favourite, the duke of Lerma, while he contented himself with the performance of religious duties and the ceremonies of a stately court The change of rulers was significantly marked in a quarrel with the province of Biscay, which still retained its ancient privileges intact An attempt was made in 1601 to impose new duties by a royal ordinance, the Biscayan deputies protested vigorously against this encroachment upon their liberties, and openly threatened to seek another ruler. Philip III hastened to avert the storm by withdrawing the obnoxious ordinance Thus the policy of centralization was abandoned, and the tendencies to division and isolation were confirmed

The Moors expelled from Spain The piety of Philip III, which was as disastrous to Spain as the more masculine bigotry of his predecessors, found characteristic expression in the persecution of the Moriscoes Ever since the suppression of their first revolt in 1502,—a revolt which was provoked by the breach of the compact made on the fall of Granada,—the conquered Moors had been cruelly oppressed Charles V renewed the edict of 1502 in 1526, and the overt profession of Mohammedanism was extinguished in Spain But in secret they continued to cherish the faith of their ancestors, and this was enough to exasperate a monarch who preferred to have no subjects at all rather than to rule over heretics An edict of Philip II in 1566 forbade them to speak or write in Arabic, and ordered them to renounce all their traditional habits and ceremonies Futile remonstrances were followed by a desperate rising, which was quelled in 1570 The most obstinate of the rebels were exiled to Africa, but most of them sullenly submitted Philip III determined to prove his zeal for orthodoxy by completing the work which his father had left unfinished In 1609 all the Moriscoes were ordered to depart from the Peninsula within three days, and the penalty of death was decreed against all who failed to obey, and against any Christians who should shelter the recalcitrant. The edict was obeyed, but it was the ruin of Spain The Moriscoes were the backbone of the industrial population, not only in trade and manufactures, but also in agriculture The haughty and indolent Spaniards had willingly left what they considered degrading employments to their inferiors The Moors had introduced into Spain the cultivation of sugar, cotton, rice, and silk They had established a system of irrigation which had given fertility to the soil The province of Valencia in their hands had become a model of agriculture to the rest of Europe In manufactures and commerce they had shown equal superiority to the Christian inhabitants, and many of the products of Spain were eagerly sought for by other countries All these advantages were sacrificed to an insane desire for religious unity

The resources of Spain, already exhausted, never recovered from this terrible blow Under these circumstances it was an absolute necessity that the ambitious schemes of previous rulers should be abandoned, and it was fortunate that Lerma was personally inclined to a policy of peace and that events occurred to favour its adoption The accession of James I in England gave a convenient opportunity for concluding the long war that had been carried on with Elizabeth English mediation brought about a twelve years' truce in 1609 with the United Provinces, which amounted to a practical recognition of their independence The death of Henry IV and the regency of Mary de' Medici enabled Lerma to arrange an alliance with France, which was cemented by a double marriage Louis XIII married the infanta Anne of Austria, and Elizabeth of France was betrothed to the son and heir of Philip III For the moment Spain occupied a higher position in Europe than it had held since the defeat of the Armada James I was weakened by quarrels with his parliament and by the want of a definite policy France under the regency had abandoned the attitude of Henry IV and was distracted by internal squabbles The empire was in the feeble hands of Mathias, and the Austrian Hapsburgs were still divided by the family jealousies that had arisen from the deposition of Rudolph II The Turks had declined since the days of Soliman the Magnificent with a rapidity characteristic of Oriental powers. In the midst of these states Spain, subject to an apparently absolute monarchy, enjoyed much the same prestige as in the best days of Philip II With the consciousness of power the old ambitions revived An arrangement was being discussed for the recognition of the archduke Ferdinand as the successor of Mathias in the Austrian territories Philip III, however, advanced a claim to Hungary and Bohemia on the ground that his mother was a daughter of Maximilian II, whereas Ferdinand was only descended from that emperor's brother The claim was by no means indisputable, but it was inconvenient to Ferdinand to have to discuss it He agreed therefore to purchase the support of Spain by ceding Alsace, and the vacant imperial fief of Finale in Italy (1617), and on these terms he succeeded in effecting his designs. Thus a prospect was opened to Spain of connecting its Italian possessions with the Netherlands and of forming a compact Spanish dominion in central Europe At the same time the old policy of advancing Roman Catholicism was resumed, as the success of Ferdinand promised to secure a signal victory for the Counter-Reformation in Germany But this forward policy was distasteful to Lerma, who found it necessary to retire in 1618. His withdrawal from affairs was not accompanied by any loss of the royal favour, and the offices which he had held were conferred upon his son, the duke of Uzeda

The alliance between the two branches of the house of Hapsburg was not finally completed by the arrangement with Ferdinand It was vigorously urged by Oñate, the Spanish representative at Vienna, by Khevenhuller, the

Austrian envoy at Madrid, and by the Spanish party, headed by Zuñiga, which had always opposed the policy of Lerma. But neither Uzeda nor the royal confessor Aliaga was in favour of an alliance by which Spanish blood and treasure were to be expended in securing the interests of Austria. Philip III., however, was gained over by an appeal to his religious feelings, and in January 1620 he undertook to send assistance in men and money to Ferdinand II. Thus Spain was involved in the Thirty Years' War, which had been commenced in 1618 by the revolt of Bohemia against Ferdinand, and the acceptance of the crown by the elector-palatine Frederick V. Spanish troops from Italy aided Tilly to win the battle of the White Hill, and Spinola led an army from the Netherlands against the Palatinate. But the party of peace was still strong in Spain. Frederick V. was the son-in-law of James I., and his complete humiliation would hinder the long-cherished project of a marriage between Prince Charles and the Spanish infanta. The truce with Holland would expire in April 1621, and if the war was to be resumed with the Dutch it was essential to isolate them by concluding the alliance with England. Moreover, the finances of Spain were by no means in a condition to support the extraordinary expenses of a European war. All these considerations pointed to peace, and Philip III. was on the point of recalling Lerma, when he died in March 1621. His reign had not been glorious or advantageous to Spain, but it contrasts favourably with those of his successors. Spanish literature and art, which had received a great impulse from the intercourse with foreign countries under previous rulers, reached their zenith during his lifetime. Three writers have obtained European fame—Cervantes, who produced the immortal *Don Quixote* between 1605 and 1613, and two of the most fertile of romantic dramatists, Lope de Vega and Calderon. In the domain of art Spain produced two of the greatest masters of the 17th century, Velazquez and Murillo.

Thirty Years' War.

Philip IV.

The time which Philip III. had spent on his devotions was given by his successor to the more secular pleasures of hunting and the theatre. But Philip IV. shared to the full his father's disinclination to burden himself with the cares of government. The office of first minister was given to Zuñiga, the chief advocate of an aggressive policy in the late reign. Lerma and Uzeda were banished from the court. But the chief influence over the administration was exercised from the first by the royal favourite, the count of Olivares, who succeeded to Zuñiga's office on the latter's death. Olivares was a man of considerable industry and ability, though his reputation has suffered from the inevitable comparison with his great contemporary and rival, Richelieu. He conceived the plan of restoring Spain to its former greatness by returning to the policy of Philip II., regardless of the change in the internal resources of the country. All ideas of peace were abandoned, and Spain plunged headlong into the European struggle. The truce with the United Provinces was unpopular because the commercial progress of the Dutch was fatal to the trade of the Spanish Netherlands, and Amsterdam had already begun to take the place of Antwerp. The expiration of the truce in April 1621 was followed by an immediate renewal of the war. To make the war successful it was imperative to secure the alliance with England, but this was sacrificed because the emperor insisted upon confiscating the Palatinate, which was conferred upon Maximilian of Bavaria. The match with the Spanish infanta was broken off, and Prince Charles married Henrietta Maria of France. The alienation of England was enough in itself to ensure the ultimate failure of the Dutch War. On the mainland the successive stadtholders, Maurice and Frederick Henry, held their own even against the experienced Spinola, and after the latter's recall in 1629 had a distinct advantage. But it was by sea that the Dutch gained their most conspicuous successes. In 1628 the Spanish treasure-fleet was captured by Admiral Hein, whose booty was estimated at seven millions of guilders. The greater part of Brazil, together with Malacca, Ceylon, Java, and other islands, were conquered by the Dutch sailors. Instead of conquering the northern provinces, Spain had to make great exertions to defend the frontiers of the southern Netherlands.

In central Europe the fortune of war was more favourable to Spain and her allies. The crushing defeat of the elector-palatine was followed by the humiliation of the Protestant champion, Christian IV. of Denmark. Ferdinand II. enjoyed for a moment greater power than any other successor of Charles V., and the Edict of Restitution seemed to complete the triumph of the Catholic reaction in Germany. But the revival of the Hapsburg power awakened the jealousy of France, which in 1624 had fallen under the strong rule of Richelieu. The Spaniards had occupied the Valtelline, an important pass which connected Lombardy with Tyrol. A French army expelled the conquerors in 1624, and the treaty of Monçon restored the pass to the community of the Grisons. For a time France was occupied with the suppression of a Huguenot rising, but no sooner had La Rochelle fallen than Richelieu again interfered to thwart the designs of Spain in the question of the Mantuan succession. The Spaniards endeavoured to exclude the duke of Nevers, the rightful heir to the duchy, on account of his connexion with France. But Richelieu forced the Spanish troops to raise the siege of Casale, and ultimately extorted the treaty of Cherasco (1631), by which the emperor recognized the succession of the duke of Nevers in Mantua. The occupation of Pinerolo in this war gave the French an opening into Italy and threatened the ascendency which Spain had so long exercised in the Peninsula. Meanwhile the victories of Gustavus Adolphus had destroyed the imperial and Catholic ascendency in Germany. The Spaniards were ignominiously driven from the positions which they occupied on the Rhine.

The death of Gustavus Adolphus at Lutzen inspired the Roman Catholic powers with new hopes. Spain determined to strain every nerve to turn the tide of victory. Philip IV.'s brother Ferdinand, the cardinal-archbishop of Toledo, was sent to raise troops in Italy and to lead them through Germany into the Netherlands. In 1634 Ferdinand effected a junction with the imperial forces, and their combined efforts won a signal victory at Nordlingen. The Lutheran princes, headed by John George of Saxony, hastened to make terms with the emperor in the treaty of Prague (1635). The Swedes were left almost isolated in Germany, and a speedy termination of the war seemed inevitable. At this crisis Richelieu decided to embark in the war as a principal, and concluded a close alliance with the Dutch against Spain. For two or three years the new policy of France seemed likely to be attended with failure. The French troops, unaccustomed to war, were no match for the trained veterans of Spain. Not only were they repulsed from the Netherlands, but the cardinal-infant actually invaded France (1636) and inspired a panic in the capital itself. His success, however, was only temporary, and before long the superior policy of Richelieu gave France the upper hand. The occupation of Alsace, which fell into French hands after the death of Bernhard of Saxe-Weimar, interrupted the connexion between the Netherlands and Italy. In the latter peninsula the French

gained ground and restored the regent of Savoy, whom the Spaniards had expelled Finally, more important than all, the alliance with Holland gave France the superiority by sea The destruction of a great Spanish fleet in the Downs, where it had taken refuge under the neutral flag of England, made it almost impossible to send reinforcements from Spain to Brussels By striking at the points of connexion, Richelieu was breaking the unwieldy Spanish empire to pieces At this moment his task was immensely facilitated by the outbreak of internal dissensions

Olivares had been inspired by the success of his great rival with the idea of strengthening Spain by a vigorous policy of centralization The monarchy consisted of a number of scattered provinces, each ruled by a separate council at Madrid, and each possessed of its own separate institutions They were held together only by the predominance of Castile and by religious unity This system Olivares determined to abolish by elevating the royal power to equal absolutism in all the provinces The dangers from foreign enemies were to be met by forming Spain into one indissoluble whole But the spirit of provincial independence was still strong, and it was artfully encouraged by the intrigues of Richelieu, who wished to absorb the attention of Spain in its domestic affairs An edict ordering all able bodied men to arm for the war, under penalty of confiscation, provoked a revolt in 1640 among the Catalans, who were jealously attached to their old privileges, and whose proximity to the French frontier had already exposed them to intolerable hardships The Castilian troops were driven from the province, and Catalonia formed itself into a republic under the protection of France This event exerted a magical influence upon Portugal, where Richelieu's emissaries had also been active, and where the antipathy to Castile was national rather than provincial In December 1640 a revolution was successfully accomplished in Lisbon, and the crown was assumed by a native noble, John of Braganza, in whose veins ran the blood of the ancient kings These disasters were fatal to Olivares, to whose system of government they were not unnaturally attributed In 1643 he was compelled to resign his post, and Philip IV announced his intention of ruling alone

The revolt of Catalonia and Portugal, together with the undisguised discontent shown by several of the other provinces, could not but hamper Spain in the conduct of the European War The conquest of Roussillon in 1642 enabled the French to give effectual assistance to the Catalans, who acknowledged Louis XIII as count of Barcelona The successive deaths of Richelieu (1642) and Louis XIII (1643) made no difference to the policy of France, which was directed by Mazarin under the regency of Anne of Austria The French had now completely made up the military inferiority which had foiled their efforts at the beginning of the war In 1643 Enghien (afterwards the great Condé) won the first of a brilliant series of victories at Rocroi, and his success was the more important because it placed the domestic authority of the regent upon a firm footing The disasters of Spain were increased by the formidable rising of Masaniello in Naples (1647), which was carried on by the duke of Guise and was suppressed with difficulty in 1648 This was followed by the loss of the Austrian alliance through the treaty of Westphalia As it would have been impossible for Spain to contend single-handed against the hostile coalition, the opportunity was seized to make terms with Holland This was only achieved by consenting to great sacrifices Not only did Spain surrender all claims to sovereignty over the northern provinces, but it also ceded to them the northern districts of Brabant, Flanders, and Limburg, with the strong fortresses of Maestricht, Hertogenbosch (Bois-le-Duc), Bergen-op-Zoom, and Breda The Dutch retained all their conquests in America and the Indies, and secured themselves from the rivalry of Antwerp by a clause which enjoined the permanent closing of the Scheldt This marks the final recognition of the United Provinces as an independent state, and also the transference to the northern powers of the maritime supremacy hitherto claimed by Spain

France and Spain were now left face to face with each other For the next four years the disturbances of the Fronde gave the Spaniards a great opportunity, of which they were not slow to avail themselves In the Netherlands they recovered Gravelines, Ypres, and Dunkirk, while Don John of Austria, a natural son of Philip IV, took Barcelona and reduced the Catalans to submission But the triumph of Mazarin in 1653 enabled France once more to devote itself to the war, although at the same time it drove the great Condé into the Spanish service The military operations now reduced themselves to a duel in the Netherlands between the rival generals Condé and Turenne The old tactics, which were adhered to with Spanish obstinacy, were now out of date, and the once invincible infantry was almost useless against the quick movements of light-armed troops which had been introduced by Gustavus Adolphus The struggle was finally decided by the intervention of England Both powers had earnestly sued for the support of Cromwell. The rapid advance of the French power was a cogent reason for England to assist Spain, but the religious bigotry that still prevailed at Madrid made the alliance impossible At last Mazarin gained over the Protector by promising to banish the Stuarts from France and to cede Dunkirk Reinforced by 6000 Ironsides, probably the best soldiers in Europe, Turenne was irresistible Dunkirk was reduced after an obstinate defence and handed over to the English, to the great scandal of Roman Catholic Europe One after another the fortresses of Flanders fell into the hands of the French, and, though the death of Cromwell lost them the support of England, it was impossible for Spain to continue the war In 1659 Mazarin and Don Luis de Haro, the successor of Olivares, met on a small island in the Bidassoa, and there arranged the treaty of the Pyrenees Spain had again to make great sacrifices Besides Artois and several fortresses in the Netherlands, Roussillon and Cerdagne were ceded to France, and thus the Pyrenees were fixed by law as the boundary between the two countries Louis XIV was to marry the infanta Maria Theresa, who was to receive a large dowry, but was to renounce all eventual claims to the Spanish crown The only concessions made by France were the pardon of Condé, the recognition of Catalonia as a province of Spain, and the promise to give no more assistance to the Portuguese

Now that Spain was freed from external hostilities, it seemed possible that the reduction of Portugal might be at last accomplished But the alliance of France was speedily replaced by that of England, and Catherine of Braganza was married to Charles II Louis XIV, too, tried to obtain from the Spanish Government an acknowledgment of his wife's claims to the succession, and failing in this he continued to send secret assistance to the Portuguese A French general, Schomberg, defeated Don John of Austria in 1663, and two years later routed the Spanish forces at the battle of Villa Viciosa This final disaster crushed the declining energies of Philip IV, who died on September 17, 1665. As his son Charles II was only four years old, he bequeathed the government to his widow Maria Anna of Austria, with a special junta to advise her in the conduct of affairs As the Spanish monarchy had declined, its

Regency of Maria Anna

authority had been exercised by a series of chief ministers,—Lerma, Olivares, and Haro,—and this was the only way in which the unity of the executive power could now be maintained The favour of the queen-mother raised to this position her confessor, Father Nithard, a native of Styria He was a man of ability and experience, and set himself to cope with the most glaring evils of the state He endeavoured to diminish the public expenditure by limiting the salaries of officials, and by putting an end to the abuses which hindered the commerce with the colonies But he was soon called upon to face unexpected difficulties Louis XIV advanced a claim, on behalf of his wife, to certain territories in the Netherlands in virtue of the so-called "law of devolution" This was an old custom by which the children of the first marriage succeeded, to the exclusion of all later descendants As Spain resisted the claim, the French invaded Flanders and overran Franche-Comte The regent was compelled to purchase the restoration of the latter province by ceding part of Flanders to France in the treaty of Aix-la-Chapelle (1668) At the same time the independence of Portugal was finally acknowledged These disasters increased the jealousy with which the Spanish nobles regarded the rule of a Jesuit and a foreigner A strong opposition party was formed under the leadership of Don John of Austria, and in 1669 Nithard was compelled to resign But among the nobles themselves there was little unity, and a difference arose as to the policy to be pursued when Louis XIV attacked Holland in 1672 The queen-mother was naturally on the side of Austria, and her influence was sufficient to secure the adhesion of Spain to the first European coalition against France This success she followed up by obtaining the post of chief minister for another favourite, Fernando de Valenzuela, who was appointed marquis of Villafierra and raised to the rank of a grandee of Spain This revived the jealousy of the nobles, who again formed a league for the maintenance of their privileges under Don John of Austria This time they were completely successful Not only was Valenzuela banished, but Maria Anna herself was compelled to retire from the court and to take up her residence in Toledo Don John was now all-powerful A natural antipathy to the policy of the regent led him to draw aloof from the Austrian alliance and to attach himself to France A marriage was concluded between Charles II and Maria Louisa of Orleans It was hoped that by this means better terms would be obtained from Louis XIV, but in the treaty of Nimeguen Spain had to surrender Franche-Comté and fourteen fortresses in Flanders This treaty marks the complete loss by Spain of its position as a first-rate power Henceforth it could only exist by the support of those states which resented the aggrandizement of France Don John was no more successful in his domestic than in his foreign policy His industry was as unwearying as that of Philip II himself, and he determined to rule independently of all interested advisers The reform from which he hoped most was a revocation of the crown domains which had passed into private hands But the scheme met with natural opposition from the nobles, and he died in 1679 without having accomplished anything For a year Charles II endeavoured to rule in person with the help of the ordinary council, but the attempt only showed how the strength of the monarchy was bound up with the personal character of the ruler "Charles V.," says Mignet, "had been both general and king, Philip II was merely king, Philip III and Philip IV had not been kings, Charles II was not even a man" From infancy Charles's health had been so defective that his death had appeared an imminent contingency, and his intellect was as feeble as his body It was impossible for him to exercise any effective control over the government, and he was little more than a tool in the hands of the nobles, who, under Don Luis de Haro, had recovered much of the political influence from which Olivares had excluded them In 1680 the office of first minister was given to the greatest of Spanish magnates, the duke of Medina-Celi It was at this time that Louis XIV. was conducting his famous *réunions*, and the weakness of Spain enabled him to annex without opposition Courtrai, Dixmude, and the great fortress of Luxemburg Medina-Celi, disgusted with his thankless task, resigned in 1685, and his place was taken by Count Oropesa The new minister revived the alliance with Austria, and Spain became a member of the league of Augsburg in 1686 The success of the league seemed to be almost assured by the Revolution which gave the crown of England to William III, the leader of the opposition to Louis XIV But in spite of apparently overwhelming odds France more than held her own, and Spain was humiliated by the capture of Urgel and Barcelona Ministers held office only at the will of court factions, and the first disaster was fatal to Oropesa Spain continued to play a secondary part in the war, which was concluded in 1697 by the treaty of Ryswick, the first for many years in which France did not obtain any addition of territory The chief motive for Louis XIV's moderation was the desire to devote his attention to the approaching question of the Spanish succession

Charles II

Decline of Spain in the 17th century.

The decline of Spain in the 17th century is not to be measured by its territorial losses Holland had extorted a tardy recognition of its independence, Portugal was once more a separate kingdom, Catalonia was reduced only to very doubtful submission, France had seized upon Roussillon and Cerdagne, Franche Comté, and great part of the southern Netherlands, French influence had been established in Italy as a counterpoise to that of Spain But the weakness of the extremities, to which these facts bear conclusive testimony, was the result of still greater weakness at the centre The population of the peninsula, estimated at twenty millions under the Arabs and at twelve under Ferdinand and Isabella, had fallen to less than six millions in the reign of Charles II This decrease of numbers was doubtless due in the first place to the religious bigotry which had condemned thousands of Jews and Moriscoes to death or exile, but it is partly traceable to a fatal decline in the economic prosperity of the country Agriculture, for which many parts of Spain were peculiarly fitted, had suffered from the departure of the Moriscoes and from a number of other causes The want of any law of mortmain had led to the accumulation of at least one-fourth of the land in the hands of the monasteries, the most charitable but the most careless and conservative of landlords Thanks to their obstinate adherence to obsolete methods of cultivation, their estates produced little more than one per cent on the outlay The system of entail, which earlier monarchs had striven to restrict, made enormous strides in the 16th century, and most of the secular estates were inalienably concentrated in the hands of a few great nobles, who lived at Madrid and spent their revenues in lavish extravagance without any regard to the interests of their tenants In the fertile provinces of Andalusia and Estremadura agriculture was entirely ruined by the system of sheep-farming In the 12th century, when the country was exposed to the destructive forays of the Moors, the inhabitants had been forbidden to enclose their lands with either hedges or ditches, and successive kings had encouraged the rearing of huge flocks of sheep which could easily be driven over the open country into a place of safety In the 16th and 17th centuries the condition

of things had entirely changed, but the old regulations were jealously maintained by the company of *La Mesta*, one of the most powerful and independent corporations in Spain This body, which derived large revenues from the sale of wool, was enabled to retain its privileges intact until the reign of Charles III Every summer their flocks poured down the northern mountains, and the absence of enclosures made it impossible to defend the crops from their ravages Besides making agriculture impossible, the exclusive attention to sheep-rearing led to the gradual disappearance of the old forests, and, as no one ventured to plant new trees, great parts of Castile became an arid desert Every kind of industry suffered in the same way as agriculture The true Spaniard despised all who earned a living by handicraft, and when the Moriscoes had been banished it was impossible to obtain skilled artisans except by importing them The Spaniards could not even cut their own timber into ships or construct fortifications for their own towns Madrid and other cities were crowded with foreigners, who hastened to make a fortune that they might carry it back to their native land The Government was quite as much to blame as individuals The gold from the New World would have enabled Spain to command the markets of Europe, but the mediæval restrictions on the exportation of the precious metals were strictly enforced The high price of commodities was attributed, not to the superfluity of the medium of exchange, but to the competition of foreign and colonial markets It was forbidden to export one article after another, and the colonies were expected to send gold without receiving anything in exchange A more ruinous policy could hardly be conceived, but it was supported by the merchants themselves, who refused to fill their vessels with anything but gold and silver, and left the indigo, cotton, and other commodities to the English and the Dutch Domestic production, crippled by these restrictions, was almost destroyed by the excessive taxation rendered necessary by the ambitious schemes of Philip II and his descendants It is notorious that Austria could never have carried on the Thirty Years' War so long but for the supplies received from Spain Spain, in fact, was the great subsidizing power in the 17th century, as England was in the 18th The enormous expenditure thus necessitated was wrung from the classes least able to pay it, as the Government was not strong enough to attack the exemption of the nobles and clergy The *alcavala*, the tax on sales which Ximenes had abolished, was restored under Philip II, and in the 17th century reached the enormous amount of 14 per cent The traders naturally sought to evade a tax which it was impossible to pay But this only increased the vigilance of the revenue officers, who endeavoured to collect the tax at every opportunity, on the raw material, on the manufactured product, and again every time that it changed hands Taxation in Spain was a caricature of Alva's system in the Netherlands, and was even more ruinous than that had been Foreign nations reaped all the advantages which the short-sighted policy of the Spaniards threw away It has been calculated that five-sixths of the manufactured commodities consumed in Spain were provided by foreigners, and that they carried on nine tenths of the commerce with the Spanish colonies By law all foreign trade with the colonies was prohibited, but the decline of native industry made it impossible to enforce the laws, and the Spanish Government had to connive at a contraband trade of which other countries gained all the profit The policy of the earlier kings had made the colonies dependent upon European products, and when Spain could no longer supply them they had to be obtained elsewhere Circumstances in the latter half of the 17th century allied Spain with England and Holland against France, and the English and Dutch founded their commercial supremacy upon the trade which Spain threw into their hands The country which had sent a hundred vessels to Lepanto, and which in 1588 had despatched the great Armada against England, was reduced under Charles II to borrowing Genoese vessels to maintain its connexion with the New World The army, which had once been the terror of Europe, had sunk at this time to an effective force of little more than 20,000 men In literature and art the decadence of Spain was equally conspicuous and complete The religious unity of the country was preserved, but all touch with the intellectual advance of Europe was deliberately sacrificed

The Spanish succession question

In spite of its loss of power and prestige, the crown of Spain was still regarded as a prize well worth winning Ever since Charles II's accession the Spanish succession had been a prominent question for European diplomacy, and from 1697 it became the pivot on which international relations turned Charles II's first wife, Maria Louisa of Orleans, had died childless in 1689, and his second marriage to Maria Anna of Neuburg was equally unfruitful The male line of the Spanish Hapsburgs was evidently on the verge of extinction, and by law and tradition the crown would pass to the nearest female or her heir But the question was complicated in many ways Of Charles II's two sisters, the elder, Maria Theresa, had married Louis XIV, and had renounced her claims, but her husband had always protested against the renunciation, and the non-payment of the stipulated dowry gave him an argument for its nullity The younger, Margaret Theresa, had married the emperor Leopold I, and had made no renunciation, but she had since died, leaving an only daughter, Maria, who married the elector of Bavaria Going a generation back, the two sisters of Philip IV had also married into the houses of Bourbon and Hapsburg Anne of Austria, whose renunciation of the Spanish crown was undisputed, was the mother of Louis XIV, while Maria Anna was the mother of Leopold I Ever since the division of the house of Hapsburg into two branches it had been agreed by a family compact that if either became extinct the other should succeed to its territories Leopold I was extremely anxious to restore the unity of the family by securing the observance of this compact, and he had a great advantage in the fact that Charles II's mother was his own sister, and Charles's second wife was his sister-in-law The will of Philip IV. had arranged that, after Charles II and his descendants, the crown should pass, first to Margaret Theresa and her children, and secondly to Leopold and his children It was a great disappointment to Leopold that his first wife left him only a daughter, but he tried to secure the claims of his family by extorting from her on her marriage a renunciation of her rights to the crown of Spain. This renunciation the Spanish Government had never recognized, and the queen-mother, whose adherence to the Hapsburg interests was overcome by her feelings for her own family, induced Charles II to make a will in 1696 in which he named Joseph Ferdinand, the infant electoral prince of Bavaria, as his heir But the queen-mother's death withdrew the dominant influence at the court of Madrid and enabled the Austrian envoy, Count Harrach, with the help of the queen, to procure the revocation of this will The succession now became the subject of party quarrels and intrigues, in which the rival envoys of Austria and France took a prominent part The aim of Leopold I was to obtain the succession of his second son, the archduke Charles, while Louis XIV hoped to procure the Spanish crown, if not for his son, at least for one of his grandsons The office of first minister

in Spain had not been filled up since the fall of Oropesa, and the most influential man in the kingdom was Cardinal Portocarrero, archbishop of Toledo. He was a bitter opponent of the queen, who was extremely unpopular, and all his efforts were directed to thwart the schemes of Austria. To depress the cardinal, Maria Anna induced Charles II to recall Oropesa, but the latter declined to return to the Austrian alliance which he had previously championed, and espoused the cause of the electoral prince. There was no semblance at this time of a French party in Madrid, but Louis XIV availed himself of the cessation of hostilities to send thither an able diplomatist, Count Harcourt, who speedily contrived to exercise considerable influence over the course of events.

Too many European interests were involved in the succession to allow it to be settled as a mere question of domestic politics. The idea of the balance of power dominated European diplomacy at this time, and William III of England was its avowed and recognized champion. England and Holland, the two countries with which William was connected, were vitally interested in the Spanish trade. The accession of a French prince in Spain would almost inevitably transfer to France all the advantages which they at present enjoyed. It was obvious that William III must have a voice in the settlement of this succession, and Louis XIV, who had no desire for a new European war, was willing to recognize this. The negotiations between England and France resulted in the first treaty of partition (October 11, 1698). The electoral prince was to receive the bulk of the Spanish empire, viz., Spain itself, the Netherlands, Sardinia, and the colonies; the dauphin was to have Naples, Sicily, Finale, and Guipuzcoa, while Lombardy was to go to the archduke Charles. This treaty had one fatal defect—that it was based solely on the interests of the contracting powers and took no account of the wishes of the Spaniards, who resented any proposal for the division of the empire. The first hint of the treaty irritated Charles II into making a second will in November in favour of the electoral prince, and all parties in Spain agreed in its approval. But within three months both treaty and will were rendered null by the sudden death of the infant prince (February 1699), and the question, thus reopened, became more thorny than ever, as the choice now lay definitely between Austria and France. It seemed almost impossible to prevent the outbreak of a general war, but William III patiently reunited the broken threads of his diplomacy, and arranged with France a second treaty of partition. The Spanish monarchy was to be divided into two parts. The larger, consisting of Spain, the Netherlands, Sardinia, and the colonies, was to go to the archduke Charles. The dauphin was to receive the share stipulated in the former treaty, with the material addition of Lorraine. The duke of Lorraine was to be compensated with the Milanese. This treaty, unlike the first, was communicated to Austria, but the emperor, who was now confident of securing the whole inheritance, refused to accept it.

Meanwhile the death of the electoral prince had destroyed the temporary unanimity at Madrid. Portocarrero and his partisans were gained over to the side of France by Harcourt. Oropesa fell back upon a scheme of his own for uniting the whole Peninsula under the king of Portugal. The queen returned to her old allegiance to her brother-in-law, and formed a close alliance with Harrach for the advancement of the interests of the archduke Charles. A popular rising overthrew Oropesa and enabled Portocarrero to regain his ascendency. At this juncture came the news of the second partition treaty, which again irritated the tender susceptibility of the Spaniards. The Austrian party hoped to utilize the popular feeling against Louis XIV as a party to the hated treaty. But Harcourt adroitly contrived to suggest that the best way of annulling the partition project was to enlist Louis's own interests against it. The view steadily gained ground that the house of Bourbon was the only power strong enough to secure the unity of the Spanish empire. Portocarrero succeeded in inducing Pope Innocent XII to support the French claim. Charles II, feeble to the last, succumbed to this combination of influences, and signed a testament bequeathing the succession to Philip of Anjou, the second grandson of Louis XIV, on condition that he would renounce all claims to the crown of France (October 3, 1700). Thus his last act was to disinherit his own family in favour of the enemy with whom he had been at war almost all his reign. He died on the 1st of November 1700.

Everything now depended upon the decision of Louis XIV. The treaty of partition offered substantial advantages to France; Charles II's will would exalt the house of Bourbon above every other family in Europe. His hesitation, whether real or feigned, did not last long. On November 16 he introduced his grandson to the French court as Philip V of Spain. The dynastic ambition of the king was also based upon sound policy. In the face of Spanish opinion and of the emperor's refusal it was impossible to carry out the partition treaty. And for the moment it appeared that the accession of a Bourbon prince would be secured without difficulty. Philip V. was proclaimed in all parts of the Spanish monarchy amid popular acclamations. Leopold I protested and prepared to attack Lombardy, but he could not hope to obtain the whole succession for his son without the assistance of the maritime powers. William III, who saw the aims of his life threatened with ruin, was eager for war, but his subjects, both in England and Holland, were resolute to maintain peace. In these circumstances Louis XIV played into the hands of his enemies. He expelled the Dutch garrisons from the fortresses of the Netherlands which they had occupied since the treaty of Ryswick, and replaced them by French troops. He showed a cynical intention to regard Spain as a province of France, and he took measures to secure for the French the commercial advantages hitherto enjoyed by England and Holland. William III was thus enabled to conclude the Grand Alliance (September 7, 1701), by which the contracting powers undertook to obtain the Netherlands and the Italian provinces of Spain for the archduke Charles and to preserve the mercantile monopoly of the English and Dutch. A few days afterwards James II died at St Germains, and Louis XIV was injudicious enough to acknowledge his son as king of England. This insult exasperated public opinion in that country, the Tory parliament was dissolved, and the last obstacle to William's warlike policy was swept away. William himself died in March 1702, but he left the continuance of his policy to the able hands of Marlborough and Heinsius. The war which the emperor had commenced single-handed in 1701 became general in the next year.

Philip V

War of the Spanish succession

It is needless to follow the military operations of the War of the Spanish Succession, which have been rendered famous by the exploits of Eugene and Marlborough. The chief scenes of hostilities were the Netherlands, Germany, and Italy, in each of which the French suffered fatal and humiliating reverses. At first the peninsula of Spain was not directly concerned in the war. The Grand Alliance did not aim at excluding Philip from the Spanish monarchy as a whole, but only from those parts which the maritime powers wished to preserve from French influence. But in 1703 Pedro II of Portugal deserted the cause of

France and concluded the Methuen treaty with England This opened the Peninsula to the allied forces and necessitated a revision of the terms of the alliance Pedro's support could only be purchased by the expulsion of the French from Spain, and the allies now determined to claim the whole Spanish inheritance for the archduke Charles In 1704 the archduke appeared in Portugal, and the English fleet, under Sir George Rooke, captured Gibraltar As the assistance of the Portuguese was only half hearted, it was decided in 1705 to seek a new opening in the east Catalonia, always inclined to revolt against its rulers, and recently irritated by the conduct of Philip V, offered a convenient base of operations The brilliant but eccentric earl of Peterborough succeeded in capturing Barcelona, and by the end of the year the archduke was acknowledged as Charles III in Catalonia, Valencia, and Aragon A great effort on the part of Philip to recover the lost provinces was repulsed, and a simultaneous advance of the allies from the east and from Portugal compelled him to evacuate Madrid, where Charles III was formally proclaimed But the provincial disunion, which had so often hampered the Hapsburg kings, proved the salvation of their Bourbon successor The Castilians refused to obey a king who was forced upon them from Aragon, and their religious instincts were offended by the alliance of Charles with the heretics of England and Holland Disunion among the allies aided the revolt of Castile, and by the end of 1706 Charles III found himself compelled to evacuate his recent conquests and to return to Barcelona In 1707 the allies attempted another invasion of Castile, but they were routed by the duke of Berwick at Almanza, and Aragon and Valencia were forced to return to their allegiance to Philip V For the next two years the war in the Peninsula languished. Charles III received reinforcements from Austria under Stahremberg, but he was unable to do more than retain his hold upon Barcelona In 1710 the cause of the allies received a new impulse from the arrival of Stanhope with supplies of men and money from England Under the joint command of Stanhope and Stahremberg the army advanced westwards from Barcelona, defeated Philip V at Almenara and Saragossa, and for the second time occupied Madrid The disasters which the French had experienced in other parts of Europe had broken the pride of Louis XIV, and he was prepared to purchase peace by sacrificing his grandson A treaty would have been concluded to this effect at Geertruydenburg, if the allies had not insisted that the French troops should be employed in forcing Philip V to accept it Louis XIV refused to take arms against his own family, and a sudden change in the current of fortune saved him from the humiliation which his enemies wished to force upon him Charles III found it impossible to maintain Madrid in face of the enthusiasm of the Castilians for his rival The capital of Spain was of no importance from a military point of view, and the allies determined on its evacuation On their retreat they were followed by Vendôme, whom Louis XIV had sent to his grandson's assistance Stanhope, attacked at Brihuega, was compelled to capitulate with all his forces before Stahremberg could arrive to his assistance The latter was defeated after an obstinate struggle at Villa Viciosa Aragon and Valencia again submitted to Philip, and the archduke was once more confined to Catalonia

At this juncture two events occurred which completely altered the balance of the contending powers The fall of the Whig ministry through a court intrigue gave the control of English policy to the Tories, who had always been hostile to the war The death of Joseph I in April 1711 left the Austrian territories to his brother, the archduke Charles, who was soon afterwards elected emperor as Charles VI To allow him to obtain the Spanish succession would be to revive the empire of Charles V, and would be even more dangerous to the balance of power than the recognition of Philip V with adequate securities against the union of France and Spain The object for which the allies had been making such immense exertions was now a result to be averted at any cost

Treaty of Utrecht

In these altered circumstances, Bolingbroke, the English minister, hurried on the negotiations with France which resulted in the treaty of Utrecht between England, France, Spain, and Holland Philip V was acknowledged as king of Spain, on condition that he should formally renounce all eventual claims to the crown of France But the partition of the Spanish monarchy was insisted upon by the allies The Netherlands were to be handed over to Austria, on condition that the Dutch should garrison the barrier fortresses Austria was also to receive the Italian provinces of Spain, with the exception of Sicily, which was given to the duke of Savoy with the title of king England naturally obtained considerable advantages from a war in which she had borne so prominent a part The acquisition of Gibraltar and Minorca gave her the control of the Mediterranean The *asiento* conferred upon her the privilege of importing slaves into the Spanish colonies, and she also obtained the right of sending a single vessel into the South Seas France had to recognize the Protestant succession, and to cede Newfoundland, Acadia (Nova Scotia), and Hudson's Bay Charles VI refused to accept the terms offered to him at Utrecht, but he found it impossible to carry on the war by himself, and in 1714 he made peace with France by the treaty of Rastatt But he still retained the title of king of Spain, and showed no willingness to acknowledge Philip V

The great blot on the conduct of the allies in arranging the treaty of Utrecht was the desertion of the Catalans, who had rendered such loyal services during the war They were left to the tender mercies of Philip V, who sent Berwick to reduce the rebellious province Barcelona resisted for many months with the heroism of despair, and was well-nigh reduced to ashes before it could be taken (September 1714) With its fall all resistance came to an end The three Aragonese provinces were deprived of the last remnants of their ancient privileges, and were henceforth ruled from Madrid under Castilian laws

With the final accession of a Bourbon king Spain entered upon a new period of history, in which it once more played a considerable part in European politics The death of Louis XIV (1715), and the acquisition of the regency in France by the duke of Orleans, destroyed the close connexion that had hitherto existed between France and Spain Philip V was hypochondriacal and bigoted, the slave of his wife and his confessor, but he had certain definite schemes to which he clung with the obstinacy of a weak character In spite of his solemn renunciations and the guarantee of the European powers, he never relinquished the idea of ultimately succeeding to the French throne In what was regarded as the probable event of Louis XV's death, he was determined to enforce his hereditary claim, even if he had to resign the crown of Spain His interests were diametrically opposed to those of the duke of Orleans, who was, after Philip's family, the natural heir to Louis XV Philip V had one other guiding passion, enmity to Charles VI, who had robbed the Spanish monarchy of its fairest provinces in Italy These provinces he set his heart upon regaining, and in this project he was encouraged by the two people who had most influence over him,—his wife and his minister

Philip V's first wife, Maria Louisa of Savoy, had died in 1714, leaving him two sons, Louis and Ferdinand. A suc-

cessor was speedily found for her in the person of Elizabeth Farnese, niece of the duke of Parma, who was suggested by Alberoni, at that time agent for Parma at Madrid The new queen speedily obtained unlimited ascendency over her husband's mind, and she displayed an unbridled ambition and a capacity for intrigue astounding in one who had been brought up in complete retirement As Philip's sons by his first wife would exclude her own children from the Spanish throne, she was anxious to obtain for the latter the reversion of the duchies of Parma and Tuscany, to which she had an eventual claim With this end in view she encouraged her husband's designs in Italy, while personal ambition made her eager to see him on the French throne Her favour gave the conduct of Spanish affairs for a short period to her countryman Alberoni, one of the strangest personages of the 18th century The son of a gardener at Piacenza, he had sought a career in the church, and had come to Spain in the suite of Vendôme, whose favour he had won by combining the functions of a cook and a buffoon After the death of his patron he remained in Spain, and conceived an ardent affection for the country of his adoption Raised to power by the part he had played in effecting the king's marriage, he determined to exalt Spain from its long depression to the position it had once occupied in Europe His domestic reforms showed that he had a real capacity for government Commerce and industry revived under his patronage, the army was reorganized, and the revenue increased But his chief attention was given to the navy, the real foundation of the former greatness of Spain Foreigners who had known the country under Charles II or during the Succession War were astounded at the strides which it had made under the new administration Alberoni himself is said to have assured Philip that with five years of peace he would make him the most powerful sovereign of Europe But these years of peace he was not destined to have Alberoni cordially approved the Italian designs of Philip, and hoped to employ the restored might of Spain in freeing his native country from the hated rule of Austria He had less sympathy with the king's hankering after the French crown and his enmity to the regent Orleans But he held office only by the royal favour, and could not venture to set up his own will against that of his master He was convinced, and not without reason, that everything would go well if he could secure the English alliance

Administration of Alberoni

But the attitude of Spain had already awakened suspicion in France, and the ready mind of Dubois had conceived a plan for thwarting Alberoni He determined to desert the policy of Louis XIV and to conclude a close alliance between France and England This was to be based upon the common danger from rival pretenders, which urged the houses of Orleans and Hanover to maintain the provisions of the treaty of Utrecht An agreement was arranged between the two states in 1716, and, being joined by Holland in January 1717, was known as the Triple Alliance This was a great blow to Alberoni, and made him anxious to postpone all hostilities until his preparations were complete But his hand was forced by the indignation excited in Philip V's mind by an insult offered to him by the emperor The grand inquisitor of Spain was arrested in Lombardy as a rebel against Charles III, his lawful king Philip V decided for an immediate rupture, and Alberoni against his will had to send an expedition to Sardinia, which overran the island in 1717 The enthusiasm excited in Spain by the unwonted news of a military success was increased in 1718 when another Spanish force occupied Sicily But meanwhile Charles VI had appealed to France and England for assistance against this rupture of the treaty of Utrecht The Triple Alliance, reinforced by the junction of Austria, became the Quadruple Alliance (August 1718) The resolution of the allies was convincingly displayed in a naval encounter in which Admiral Byng destroyed the Spanish fleet off Cape Passaro

Hitherto the only fault to be found with Alberoni's schemes is that they were attempted prematurely, and this was the fault of the king rather than of the minister But the Quadruple Alliance drove him in despair to form those far-reaching projects which are generally associated with his name, and which have given rise to the unjust impression that his whole policy was chimerical and unsound To meet the hostility of England and France he must make use of internal divisions He invited the Pretender to Spain, prepared an expedition in his behalf, and concerted with Count Gorz, the minister of Charles XII, a grand scheme by which Sweden and Russia were to combine in supporting the Jacobites against George I At the same time, through the Spanish envoy Cellamare, he organized a conspiracy among the numerous opponents of the regent All these schemes broke down simultaneously Charles XII was killed at the siege of an obscure town in Norway, Gorz was executed by his successor, the Spanish fleet which was to carry the Pretender to England was wrecked, the conspiracy of Cellamare was discovered and suppressed France declared war, and sent an army under Berwick across the Pyrenees An English fleet gratified the national love of a maritime monopoly by burning along the Spanish coast the vessels and docks which Alberoni had created The emperor, who had just ended a war with Turkey by the treaty of Passarowitz, was able to send a force which succeeded in recovering Sicily Alberoni was sacrificed to appease the enemies of Spain, and was exiled from the kingdom he had served so loyally in December 1719 A month later Philip V accepted the terms imposed upon him by the Quadruple Alliance He had to confirm his renunciation of the French crown, and also to abandon all claims on the provinces of Spain which had been ceded to Austria by the treaties of Utrecht and Rastatt He also allowed the emperor to retain Sicily, the duke of Savoy being compensated with Sardinia On the other hand Charles VI's pretensions to the Spanish crown were definitely abandoned, and the allies recognized the eventual claims to Parma and Tuscany of Philip's children by his second marriage, on condition that those duchies should never be united with Spain

In spite of the conclusion of peace, Philip continued to cherish his animosity against Charles VI, especially as the latter showed an inclination to evade the condition about Parma and Tuscany by encouraging other claimants to come forward To gratify this passion, Philip went so far as to lay aside his old enmity against the duke of Orleans, and to authorize the negotiation of a close alliance with France His eldest son, Don Luis, was married to a daughter of the regent, and Louis XV was betrothed to the infanta Maria Anna But the death of Orleans in 1723 gave a new direction to the king's policy In 1724 Europe was astounded by the news that Philip had abdicated in favour of Don Luis, and had gone into retirement at San Ildefonso This act was generally attributed to the indolence and superstition which formed the basis of his character, but the real motive was undoubtedly a desire to remove the chief obstacle to his accession in France Louis XV, however, disappointed his expectations by continuing to live, and the queen soon wearied of her unwonted seclusion Luis only survived his accession eight months, and to the surprise of the world Philip V emerged from his retreat to resume the crown which he had laid down of his own accord.

The queen returned to power more determined than ever to carry out her favourite scheme of obtaining an Italian principality for her eldest son Don Carlos. As France and England had shown themselves lukewarm in the matter, she resolved to turn to her husband's enemy, Charles VI. This scheme was suggested by a Dutch adventurer, Ripperda, who inspired Elizabeth with a belief that the Austrian alliance would enable her not only to effect her object in Italy, but also to regain Gibraltar and Minorca for Spain. This was rendered the more probable by the fact that Charles VI. had quarrelled with England about the foundation of the Ostend Company. The conduct of the affair was entrusted to Ripperda himself, and while he was at Vienna a great impulse was given to the negotiation by a complete rupture between Spain and France. The duke of Bourbon, who had become chief minister in France after the death of Orleans, had set himself to reverse the policy of his predecessor. To complete this, he sent the infanta back to Spain and married Louis XV. to Maria Leczinska, daughter of the ex-king of Poland. This insult removed the last scruples of Philip V. about the Austrian alliance, and in April 1725 Ripperda concluded the treaty of Vienna. The mutual renunciations arranged by the Quadruple Alliance were confirmed. Spain recognized the settlement of the Austrian succession by the Pragmatic Sanction and promised great commercial privileges to the Ostend Company, while Charles VI. pledged himself to secure the succession of Don Carlos in Parma and Tuscany and to use his influence with England to obtain the restitution of Gibraltar and Minorca. By a secret treaty Charles further undertook, in the case of England's refusal, to assist Spain with arms and also to send aid to the Jacobites. These terms were soon divulged by the indiscreet vanity of Ripperda himself, and England and France formed the counter-league of Hanover (September 1725), which was also joined by Frederick William I. of Prussia, though only for a short time.

Ripperda.

Ripperda returned to Spain, to be rewarded with the office of chief minister. But his success seems to have turned his head; his boasts about the grand results to be expected from the Austrian alliance proved to be ill-founded, and his fall was as sudden as his rise had been. After a brief period of exile in England, he sought a new home in Morocco, where he became a convert to Islam and died in 1737. But his policy was continued by his successor, Don Joseph Patiño, who sent a fleet to lay siege to Gibraltar. Europe was now divided into two hostile leagues, but the outbreak of a general war was averted, partly by the pacific inclinations of Walpole in England and Fleury in France, and partly by the growing coolness between Austria and Spain. Charles VI. had been led into the treaty of Vienna by a momentary pique against England, but he soon realized that he had more to lose than to gain by favouring the Spanish designs upon Italy. Accordingly, in May 1727, while the siege of Gibraltar was proceeding, he threw over his obligations to Spain and signed the preliminaries of a peace with England and France. The Ostend Company was suspended, and the questions about Parma, Tuscany, and Gibraltar were referred to a European congress at Soissons. The Spanish Government found it impossible to hold out in isolation, and accepted these terms by the convention of the Pardo (March 1728).

The congress of Soissons was a complete failure, and the irrepressible energy of the Spanish queen discovered a new method of obtaining her ends. The birth of a son to Louis XV. removed into the background all idea of the succession in France, and the attitude of Charles VI. proved that he would do nothing for Don Carlos. Under these circumstances there was no alternative but to sacrifice the prospect of recovering Gibraltar and Minorca and to seek the alliance of England and France. By the treaty of Seville (November 1729) these powers, with Holland, concluded an offensive and defensive alliance with Spain. The privileges which the latter country had conferred upon the Ostend Company were revoked. Don Carlos was recognized as the heir to Parma and Tuscany, and to enforce his claims these provinces were to be occupied by 6000 Spanish troops. Charles VI., astounded at this sudden change in the aspect of affairs, took active steps to oppose this occupation of the duchies. He collected 30,000 troops in Italy, and when the old duke of Parma died in January 1731 he seized his territories as an imperial fief. Elizabeth called upon her allies to carry out the treaty of Seville, but Walpole and Fleury were unwilling to resort to hostilities. Luckily Charles VI. thought more of securing his daughter's succession in Austria than of anything else. By promising that England would guarantee the Pragmatic Sanction, Walpole induced the emperor to conclude the second treaty of Vienna (March 1731), which dissolved the Ostend Company and confirmed the provisions of the treaty of Seville. In 1732 English ships conveyed Don Carlos and the Spanish troops to Italy. Parma and Piacenza were immediately occupied, and the grand duke of Tuscany acknowledged Don Carlos as his heir.

In the long and intricate series of negotiations of which we have given a brief summary the guiding thread is the grasping ambition of the queen of Spain. That ambition was by no means satisfied by the results obtained in the treaty of Vienna. Austria still held the Italian provinces of Spain and was looking out for an opportunity to expel Don Carlos from central Italy. England retained her hold upon Gibraltar and Minorca, and claimed a maritime and colonial supremacy which threatened to thwart all schemes for the revival of Spanish commerce. Elizabeth never relinquished for a moment the hope of humiliating England and expelling the Hapsburgs from Italy. Circumstances at this time were more favourable than they had ever been before. The able administration of Patiño, "the Colbert of Spain," had restored order in the Spanish finances, and had already made considerable strides towards the creation of a formidable fleet. But the great advantage lay in the fact that the death of Orleans and the birth of children to Louis XV. had removed all obstacles in the way of an alliance between Spain and France. The close union between the two branches of the house of Bourbon, which the Grand Alliance had endeavoured to avert, and which circumstances had postponed for twenty years, was now to become an accomplished fact. In 1733 "an eternal and irrevocable family compact" was signed by the Count Rottembourg and Don Joseph Patiño. France and Spain pledged themselves to pursue a common policy in regard both to Austria and England, the object of which was to destroy the Italian ascendency of the one and the commercial monopoly of the other. This treaty, which constituted a danger to Europe hardly less than the aggressions of Louis XIV., was kept a profound secret, and, though its existence was more than suspected at the time, its full importance has not been apprehended until recent times.

War of the Polish succession.

The first opportunity for carrying out this common policy was offered by the dispute about the Polish succession which broke out in 1733 between Stanislaus Leczinski and Augustus III. of Saxony. Austria and Russia supported the latter prince, while Louis XV. espoused the cause of his father-in-law. But the war in Poland itself was of very secondary importance compared with the hostilities to which it gave rise in southern Europe.

France, Spain, and Sardinia concluded the league of Turin (October 1733) for the partition of Charles VI.'s Italian provinces. The chief events of the war, from the Spanish point of view, were the occupation of Naples and Sicily by Don Carlos. It was intended that he should keep these kingdoms, and that Parma and Tuscany should be transferred to his younger brother Don Philip. But Fleury, seeing an opportunity of securing his own ends, refused to continue the war for the aggrandizement of Spain. In 1735 he concluded the preliminaries of a peace with Austria by which Don Carlos was to be recognized as king of the Two Sicilies, Charles VI. was to be compensated with Parma, and his son-in-law was to receive Tuscany in exchange for Lorraine, which was eventually to pass to France. The Spanish queen was bitterly indignant at the desertion of her ally, at the cession of her native Parma to Austria, and at the failure to provide anything for her second son. She struggled hard to prolong the war, but the only result of her manœuvres was to postpone the conclusion of the definitive treaty until 1739, when the preliminaries were confirmed.

War of Jenkins's ear. Meanwhile Spain had become involved in a maritime quarrel with England. The restrictions imposed by the treaty of Utrecht upon English trade with the Spanish colonies had been systematically evaded by the development of a system of organized smuggling on the part of the British traders. The Spaniards, encouraged by the secret compact with France, refused to tolerate an abuse which their weakness had compelled them to connive at in the previous century. To put a stop to it they rigidly enforced their right of search, often seizing British vessels on the high seas and treating the crews with gross brutality. This gave rise to great ill-feeling between the two nations, which was increased by other colonial disputes about the right of gathering logwood in Campeachy Bay and on the frontiers of Florida. The popular indignation in England, which Walpole's opponents fanned for their own purposes, was raised to fever-heat by the story of Jenkins, an English captain, who maintained that he had been tortured and his ears cut off by a Spanish *guarda costa*. Walpole, who had refused to believe in the Family Compact, and had steadily adhered to a policy of peace, was compelled by the popular clamour to declare war in October 1739. The maritime operations which followed were insignificant. Admiral Vernon took Porto Bello, and Anson plundered Payta; but England was distracted by party jealousies and her naval organization had fallen into disorder during the long peace. Luckily for her, Patiño had died in 1736, and the impulse which he had given to the Spanish navy ended with him. But before long the quarrel was absorbed in the great European war which arose about the Austrian succession.

War of the Austrian succession. Charles VI. had persuaded almost every European power to guarantee the Pragmatic Sanction, but the succession of Maria Theresa to his territories was not in the least facilitated by the paper promises to support her. England was almost the only power that adhered to its engagements. Frederick of Prussia advanced an obsolete claim to Silesia, and France seized the opportunity to humiliate the house of Hapsburg. Spain hastened to join the coalition against the unfortunate heiress. Philip V. claimed to represent the Spanish branch of the Hapsburgs, and pleaded the old family agreement by which they were to succeed on the extinction of the Austrian line. There was no possibility of so absurd a claim being recognized, but it opened the prospect of recovering the lost provinces in Italy. Sardinia was gained over by the promise of part of Lombardy. Naples and Sicily were already in the hands of Don Carlos. It seemed hardly possible that Maria Theresa, pressed by enemies on every side, could successfully defend her Italian territories. A Spanish army under Montemar was embarked in French vessels, and, after evading the English fleet, landed in the Gulf of Genoa in 1741. The first news was discouraging, as Charles Emmanuel of Sardinia, ready like his predecessors to sell his alliance to the highest bidder, had been bought off by Maria Theresa. It was not till 1742 that the campaign began with an advance upon Modena, where the duke had promised his support to Spain. But the Austrians and Sardinians were the first in the field. They expelled the duke of Modena from his territories, and drove Montemar to retreat towards Naples. At the same time the English fleet appeared before Naples, and the threat of an immediate bombardment compelled Don Carlos to promise a strict neutrality during the rest of the war. Count Gages, who was sent to supersede the unsuccessful Montemar, was unable to recover the lost ground, and the first campaign ended without any serious advantage to either side beyond the Austrian occupation of Modena. In 1743 Gages again attempted the invasion of Lombardy, but was defeated at Campo Santo and repulsed. Austria and Sardinia concluded a close alliance in the treaty of Worms (September 1743), which was negotiated by England. France and Spain sought to meet this coalition by renewing the Family Compact at Fontainebleau (October 1743). France undertook to aid in conquering the Milanese for Don Philip, to declare war against England, and not to make peace until Gibraltar, and if possible Minorca too, had been restored to Spain. Don Philip himself was sent with a Spanish army through southern France, but he failed to force a passage through the Alps. The campaign of 1744 was indecisive, but in the next year the great efforts made by Maria Theresa to recover Silesia gave her opponents in Italy an opportunity of which they were not slow to avail themselves. Gages effected a junction at Genoa with the combined French and Spanish troops under Maillebois and Don Philip. Advancing into Piedmont the allies took Tortona, and after occupying Parma and Piacenza they invaded Lombardy. This move effected the desired object of separating the Austrians and Sardinians. Schulenburg hurried off to the defence of his mistress's territories, and the allies at once turned upon Charles Emmanuel and defeated him at Bassignano. The French wished to complete the conquest of Piedmont, but the Spaniards insisted upon renewing the invasion of Lombardy. That province was now entirely undefended, as the Austrians had returned to the assistance of Charles Emmanuel, who detained them by the threat that if he were deserted he would make terms with the allies. One town after another surrendered or was taken, and in December Don Philip entered Milan in triumph. But meanwhile Maria Theresa had ended the Silesian War by the treaty of Dresden, and was thus enabled to send reinforcements into Italy. The tide of success turned with marvellous rapidity. The Spaniards evacuated Lombardy, and were soon driven from all their conquests in Piedmont except Tortona. At Piacenza, to which the Bourbon army had retreated, it was completely defeated by the Austrians.

Ferdinand VI. At this juncture the news arrived from Spain that Philip V. had died on July 9, and had been succeeded by Ferdinand VI., the only surviving son of his first marriage. Elizabeth Farnese, "the termagant," as Carlyle calls her, whose ambition had kept Europe embroiled for thirty years, went into retirement at San Ildefonso. This event naturally influenced the war in Italy. It was not likely that the new king, who had never been on good terms with his stepmother, would expend more of his country's blood and treasure to obtain a principality for his half-brother. His first act was to supersede Gages by the

marquis of Las Minas, who found the Spanish army at Tortona and hastened to withdraw it from Italy into Savoy, which Don Philip had occupied since 1742. The Austrians at once besieged and captured Genoa, thus cutting off the possibility of a renewed invasion of Italy, except through the well-guarded passes of the Alps. From this time the military operations ceased to have any direct importance for Spain, and all interest centred in the negotiations which were carried on at Breda in 1747 and transferred to Aix-la-Chapelle in the next year. The chief obstacle to peace was the demand of a principality for Don Philip, which Ferdinand VI. persisted in as necessary for the honour of Spain. Maria Theresa had already made sacrifices to Prussia and to Sardinia, and resented the idea of ceding any more of her territories. But the persistence of England carried the day, and in the treaty of Aix-la-Chapelle (October 1748) Don Philip obtained Parma, Piacenza, and Guastalla as an hereditary principality, on condition that they should revert to Austria on extinction of his male descendants. This was the sole advantage gained by Spain. Austria retained Lombardy, shorn of the portion promised to Charles Emmanuel, and the commercial and naval ascendency of England remained unshaken. The recovery of Gibraltar, which at one time Philip V. had confidently expected, was now further off than ever.

Ferdinand VI. was as feeble in health and as averse to business as his father had been, but he was equally obstinate on certain points. He would have nothing to do with the aggressive policy of his stepmother or with the Bourbon schemes for the humiliation of England. His accession broke off the Family Compact, and gave to Spain the unaccustomed boon of thirteen years' peace. His aim was to hold the balance between the rival powers of western Europe, and in this he was aided by the discord between his two ministers, Ensenada and Carvalho, of whom the former favoured France and the latter England. When Kaunitz, the Austrian envoy at Versailles, was endeavouring to negotiate an alliance between the Hapsburgs and Bourbons, Ferdinand seized the opportunity to conclude the treaty of Aranjuez, which guaranteed the neutrality of the Italian provinces of the two families. On the outbreak of the Seven Years' War in 1756 great efforts were made to draw Spain into the struggle. France offered Minorca, which had been lost by Byng at the first outbreak of hostilities, and England hastened to make the counter-proposition of a cession of Gibraltar. Ferdinand, however, refused both bribes, and maintained his policy of peace till his death in 1759.

Charles III. This event gave the Spanish crown to Charles III., who had ruled the Two Sicilies since 1735. His accession threatened a speedy reversal of Spanish policy. The new king was a true Bourbon, and naturally inclined to the French alliance. He had an old grudge against England for the treatment he had received in the War of the Austrian Succession. He also owed a debt of gratitude to Maria Theresa for enabling him to transfer the crown of Naples to his third son, whereas by the treaty of Aix-la-Chapelle it ought to have passed to his brother, Philip of Parma. In spite of these motives, he hesitated for two years to take a decisive step. Spain was not prepared for war, and Charles had never cordially approved the change of policy at Versailles which had united France with its old rival Austria. But the rapid successes of England under Pitt's administration, and the danger of a vast extension of the maritime and colonial ascendency of that country, soon overcame his scruples. In 1761 the third Family Compact was concluded, and Spain undertook to give active assistance to France unless peace were concluded within a year. Pitt, suspecting the existence of this agreement, proposed an immediate declaration of war against Spain, but he failed to convince his cabinet and resigned. His successors, however, were driven to adopt his policy, and in January 1762 hostilities commenced between the two countries. But Spain only entered the war to share the disasters which France had already begun to suffer. An invasion of Portugal, which had been regarded as a defenceless prey, was foiled by English assistance, and the English fleet captured Martinique and Havana. The Bourbon powers found it necessary to implore peace, and it was fortunate for them that the English government had passed into the hands of Bute, who was eager to diminish the influence of Pitt by terminating the war. By the treaty of Paris (February 1763) England recovered Minorca, extended its colonies in every direction at the expense of France, and rejected all the demands which Charles III. had advanced on behalf of Spain.

In spite of the treaty Charles III.'s foreign policy continued to be guided by jealousy of England, and he clung to the French alliance as the only means by which he could avenge his recent humiliation. In this he was encouraged by his foreign minister, Grimaldi, who was so devoted to France that Choiseul declared himself to be more powerful at Madrid than at Versailles. In 1770 a dispute about the Falkland Islands, from which the English settlers had been expelled by a Spanish force, would probably have led to a renewal of war if a domestic intrigue had not succeeded at this juncture in overthrowing Choiseul. For the next few years a marked coolness grew up between France and Spain, which was increased when Louis XVI. disappointed the hopes that had been formed of his accession and left Choiseul in retirement. Grimaldi, chagrined at the failure of an alliance on which all his schemes were based, resigned office in 1777 and was succeeded by Count Florida Blanca, one of the most distinguished of the able ministers who ruled Spain during this period. The change of ministers made no difference to the policy of Charles III., whose obstinacy was in no way inferior to that of his predecessors. For many years Spain and Portugal had been engaged in disputes about the frontiers of their territories in South America, disputes which were rendered more bitter by the arrogance of Pombal, the Portuguese minister. The death of Joseph I. in 1777 and the consequent dismissal of Pombal enabled Florida Blanca to negotiate the treaty of San Ildefonso, by which Sacramento and the navigation of the Rio de la Plata were ceded to Spain, and a definite boundary was drawn between Brazil and Paraguay on the one side and Peru on the other. This was followed in March 1778 by the conclusion of a perpetual alliance at the Pardo, by which Portugal was attached to the interests of the Bourbon states. These treaties, which Florida Blanca regarded as among the most signal successes of his ministry, came very opportunely to enable Charles III. to resume the schemes that had lain in abeyance since 1763. England was involved in a desperate struggle with the revolted colonies of North America, and this offered the Bourbons the long-desired opportunity for revenge. In 1778 France entered into close alliance with the colonists, and in the next year Spain followed her example. Everything seemed to favour the allies. The Northern powers, irritated by the high-handed way in which England had asserted and exercised her maritime supremacy, formed the "armed neutrality" under the lead of Catherine II. of Russia. Even Holland, the oldest and most constant ally of England, was involved in the general coalition. England, which had failed single-handed to coerce its own subjects, was now face to face with the whole maritime power of Europe, and was also hampered by domestic and

Irish troubles Spain succeeded in capturing Minorca and laid close siege to Gibraltar Many of the West-Indian islands were captured from the English, and the surrender of Cornwallis at Yorktown destroyed the last hope of restoring American dependence The most confident hopes were entertained of stripping England of the great bulk of its colonial possessions But in 1782 the tide of success turned Rodney, by the novel manœuvre of breaking the line, destroyed the French fleet in the West Indies, while the heroic defence of General Elliott and the opportune arrival of supplies under the convoy of Lord Howe saved Gibraltar from overwhelming odds The want of unanimity among the allies, each of whom thought only of its own interests, hastened the conclusion of peace in 1783 The treaty of Versailles, by which Spain kept Minorca and obtained the Floridas, was the most honourable which that country had concluded since Cateau Cambrésis But the failure to recover Gibraltar was a bitter disappointment to Charles III, who continued till his death (December 14, 1788) to cherish the scheme of renewing the war, though the growing disorders in France made it more and more certain that he could no longer rely upon the assistance of that country

Revival of Spain in the 18th century

The reigns of the first three Bourbon kings form a period of great importance in Spanish history At the end of the 17th century Spain appeared to be a lifeless corpse, over which the other powers of Europe could contend at will In the 18th century men were astounded to see that country rise with renewed vigour to play once more an independent part on the international stage This revival was due in the first place to the change of dynasty Another Hapsburg would probably have continued the obsolete policy of his predecessors The accession of the Bourbons introduced into Spain the methods and ideas of government which had raised France to greatness under Richelieu, Mazarin, and Colbert The two great problems to be grappled with were the profound depression of trade and agriculture and the fatal wealth and ascendency of the church Philip V, feeble as he was personally, began the movement in advance even during the Succession War The abolition of the old provincial independence rendered possible a more regular and centralized government, an increase of the revenue, and the removal of the old impediments to trade between the various provinces The French officers who accompanied the king gave a new organization and new tactics to the Spanish army Under the influence of the princess Orsini Philip seemed inclined to attack even the prescriptive privileges of the clergy His marriage with Elizabeth Farnese saved the hierarchy and diverted his attention to wars of aggrandizement But these wars were directed by purely political motives, the old Hapsburg idea of a religious propaganda was for ever abandoned And even during the war the task of internal reform was hindered rather than neglected The efforts of Alberoni and Patiño gave Spain a navy more powerful than that of Philip II. The conquest of the Two Sicilies and the acquisition of Parma, though they brought little direct advantage to Spain, yet gave conclusive evidence that the old lethargy had been shaken off and that the country was capable of exertions and sacrifices which had long appeared impossible The period of peace under Ferdinand VI was an inestimable boon to Spain Taxation was lightened, production was facilitated by the removal of the most crushing burdens, yet at the same time the revenue improved and the chronic deficit of previous reigns was replaced by a surplus And this prince took a step which no one would have expected from him The concordat of 1753 was the first vindication of the political interests of Spain against the pretensions of Rome The crown asserted its right to appoint to all important benefices, and the number of papal presentations was reduced from twelve thousand to fifty-two The revenue derived by the curia from Spain was proportionately diminished, and the clergy were compelled to recognize their obligations as members of the body politic This measure was followed by an edict that henceforth papal bulls should not be obeyed until they had received the royal sanction

The work of reform, thus tentatively commenced under Philip V and Ferdinand VI, was carried still further by Charles III, whose reign is regarded with more pride by the Spaniards than any other since that of Philip II Charles had served an apprenticeship in the art of government in Naples, where, with the help of his minister Tanucci, he had successfully grappled with evils similar to those from which Spain was suffering He would have been a prince quite after the heart of the 18th century if he had not retained too large a share of the superstition of his family He shared to the full that conception of the rights and duties of monarchy which inspired the reforms of Frederick the Great and Joseph II, and his allegiance to the church was fortunately counterbalanced by his desire for absolutism His greatest work, the expulsion of the Jesuits, would never have been carried out if he had not been persuaded of its political necessity The order had already been driven by Pombal from Portugal and by Choiseul from France, when Charles III was convinced that a riot in Madrid, provoked by the financial measures of Squillaci, had been promoted by the Jesuits This conviction overpowered all scruples, the fathers were promptly removed from the country, and Spain joined the other Bourbon courts in demanding that suppression of the order which was finally decreed by Clement XIV in 1773 The Rubicon once crossed, Charles's ministers urged him on in the path of ecclesiastical reform The increase of lands in mortmain was restricted, the number of monasteries was diminished, and the Inquisition was compelled to moderate its procedure and to subordinate its independence to the royal will For the papal jurisdiction was substituted a national court, the *Rota*, established at Madrid

These measures, of which the importance in a country like Spain can hardly be over-estimated, were accompanied by others no less notable for the development of trade and agriculture The colonial trade was freed from the old restriction which compelled it to pass through Cadiz, and other ports were opened for its reception Native manufactures were encouraged in every way, and a famous ordinance in 1773 endeavoured to remove the old prejudice against trade by declaring that the engaging in industrial occupations should not involve any loss of rank or its privileges Internal communication was facilitated by the construction of canals Agriculture was revived by the removal of the old prohibition against enclosures,—so long maintained by the selfish influence of the *Mesta*,—by the planting of trees in the arid deserts of central Spain, and by the rapid growth of population, which rose in the course of the century from 5,700,000 to 10,541,000 These measures, which are only selected from a large number tending in the same direction, are to be credited to three ministers, whose names reflect its chief lustre upon Charles III's reign D'Aranda, who succeeded the Italian Squillaci as finance minister, was an Aragonese noble who had imbibed the spirit of philosophical speculation from France He was the first layman who presided in the council of Castile, and he introduced into the Spanish administration a liberal tendency quite opposed to the traditions of the country His views, however, were not congenial to the king, and, after completing his work with regard to the Jesuits and the Inquisition, he retired to the

embassy in Paris and was succeeded by Campomanes. The latter was not only a distinguished statesman but also one of the foremost representatives of Spanish literature. He was one of the earliest students of political economy, and many of the most enlightened measures for the relief and encouragement of trade are to be assigned to him. But his administration, which aimed at educating the people to a share in political life, was almost as alien to the wishes of Charles III. as the liberal and anti-clerical schemes of D'Aranda. A far more congenial minister was found in Florida Blanca, whose aim was to promote the material interests of Spain by the supervision of an internal despotism, who stopped the attack on the church when its subordination was secured, who supported the economic reforms of Campomanes, but would only carry them out by a rigid bureaucracy, and who conciliated the king by falling in with his foreign policy even when it conflicted with the national welfare.

Meritorious as Charles III.'s reforms were, it would give a false impression to represent them as completely successful. The regeneration of Spain was by no means accomplished, and many of the abuses which had been growing for centuries survived the attempt to effect their annihilation. One of the chief causes of this failure was the corruption and ignorance of the lower officials. The reforming impulse was confined to the educated classes, and made little impression upon the bulk of the people. It was of little use to devise the most enlightened measures when there was no efficient machinery to carry them out. Many of the most promising reforms remained mere paper schemes. The methods employed, too, were not always the best calculated to obtain their end. The state took too much upon itself, and attempted to discharge functions which would have been better left to local enterprise. Roads were constructed on a magnificent scale, but only too often in directions where they were not wanted, and they remained almost unused. Thus the debt was increased without any improvement of the revenue. The return of Charles III. to a military policy imposed serious burdens upon the country, and it would have been better to have prolonged the peace of Ferdinand VI.'s reign, inglorious as it appeared to an ambitious king. Undoubtedly a great advance was made, but equal exertions would have produced a greater result in any other country. The population of Spain remained to a great extent sunk in sloth and superstition. Much might be hoped from a steady persistence in ameliorative measures, but unfortunately the work of reform was interrupted just at the moment when success appeared to be within reach.

Charles IV.

The death of Charles III. and the accession of Charles IV. were contemporary with the outbreak of the French Revolution, which was destined to exercise a decisive influence over the fortunes of the adjacent peninsula. Florida Blanca, who continued to hold office during the first three years of the new reign, found it impossible to continue his policy. The revival of Spain could only be effected by the restoration of its naval and colonial ascendency at the expense of England, and for the carrying out of this scheme the support of France was imperatively necessary. But the French alliance rested upon the relationship between the two branches of the house of Bourbon, and the Family Compact ceased to exist when Louis XVI. was deprived of power by his subjects. Of this conclusive evidence was given in 1791. Some English merchants founded a settlement at Nootka Sound on the west coast of America, which provoked an indignant protest from Spain. But the French national assembly refused to send any assistance, and Florida Blanca was compelled to conclude a humiliating treaty and to give up all hope of opposing the progress of England. This failure was attributed by the minister to the Revolution, of which he became the uncompromising opponent. The reforms of Charles III.'s reign were abandoned, all liberal tendencies in Spain were suppressed, and the Government set itself to restore the old lethargy under absolute rule from which the country had been gradually awakened. The movement of reform had made so little progress among the mass of the people that reaction was really easier than progress. But Florida Blanca was not content with suppressing liberalism in Spain, he was eager to avenge his disappointment by crushing the Revolution in France. He opened negotiations with the emigrants, urged the European powers to a crusade on behalf of legitimacy, and paraded the devotion of Charles IV. to the head of his family. This bellicose policy, however, brought him into collision with the queen. Maria Louisa of Parma, a woman whose real abilities were perverted to the gratification of sensual lusts, was unwilling to allow the minister to share her ascendency over the feeble mind of her husband, and she feared that the outbreak of war would diminish the revenues which she squandered in self-indulgence. She had already removed from the ministry Campomanes and other supporters of Florida Blanca, and had compelled the latter to restrict himself to the single department of foreign affairs. Early in 1792 she completed her task by inducing Charles IV. to banish Florida Blanca to Murcia, and his place was entrusted to the veteran D'Aranda. But the new minister found that he held office only at the favour of the queen, and that this had to be purchased by a disgraceful servility to her paramour, Emanuel Godoy. Spain withdrew from the projected coalition against France, and sought to maintain an attitude of neutrality, which alienated the other powers, while it failed to conciliate the republic. The repressive measures of Florida Blanca were withdrawn, society and the press regained their freedom, and no opposition was offered to the propaganda of French ideas. D'Aranda's policy might have been successful if it had been adopted earlier, but the time for temporizing was now past, and it was necessary for Spain to choose one side or the other. But the decision was not allowed to rest with the man who had always shown a sympathy with the revolutionary principles. In November 1792 the queen felt herself strong enough to carry out the scheme which she had been long maturing. D'Aranda was dismissed, and the office of first minister was entrusted to Godoy, who had recently received the title of duke of Alcudia. Godoy, who was at once the queen's lover and the personal favourite of the king, had had no education for the part which he was called upon to play. Though endowed with a natural quickness of parts and a capacity for intrigue, he had no habits of application, no experience of the routine of office, and above all no settled policy. His appointment was regarded with jealousy by the grandees of Spain, while his undisguised relations with the queen outraged the moral feelings of the best part of the nation. Luckily for Godoy, the course to be pursued was decided for him. The execution of Louis XVI. (January 21, 1793) made a profound impression in a country where loyalty was a superstition. Charles IV. was roused to demand vengeance for the insult to his family, and from one end of Spain to the other a cry resounded for immediate war with the impious rebels who had shed the blood of an anointed king. Godoy had nothing to do but to follow the national impulse, and Spain became a member of the first coalition against France. Everything seemed to promise a rapid and complete success. The number of volunteers who offered their services rendered conscription unnecessary, and the southern provinces of France were so preponder-

atingly royalist that they were ready to welcome the Spaniards as deliverers. These advantages, however, were nullified by the shameful incompetence and carelessness of the Government. The troops were left without supplies; no plan of combined action was imposed upon the commanders; and each regiment was left to act of its own will. The military action of Spain provoked the contempt of Europe. The two campaigns of 1793 and 1794 were one long catalogue of failures. The bravery of the soldiers was rendered useless by the incapacity of their officers, and the maladministration of the central Government excited such disgust that an outbreak of revolutionary disturbance in Spain itself seemed more than possible. Instead of reducing the southern provinces of France, the Spaniards were driven from the strong fortresses that guarded the Pyrenees, and the French advanced almost to the Ebro. And at the same time the English, the hated rivals of Spain, were utilizing the war to extend their colonial power and were establishing more firmly that maritime supremacy which the Spanish Government had been struggling for almost a century to overthrow. Under the circumstances it is no wonder that the queen and Godoy hastened to follow the example set by Prussia, and concluded the treaty of Basel with France. The terms were unexpectedly favourable. Spain purchased the evacuation of her territories and fortresses by the cession of her share of St Domingo, which had little but a sentimental value as the first discovery of Columbus, and which had already been occupied by the English. So great was the joy excited in Madrid that popular acclamation greeted the bestowal upon Godoy of the title of "Prince of the Peace." But the moderation of the treaty was only a flimsy disguise of the disgrace that it involved. Spain found herself tied hand and foot to the French republic. Godoy had to satisfy his allies by the encouragement of reforms which both he and his mistress loathed, and in 1796 the veil was removed by the conclusion of the treaty of San Ildefonso. This was a virtual renewal of the Family Compact of 1761, but with far more disadvantageous terms to Spain. Each power was pledged to assist the other in case of war with twenty-five ships, 18,000 infantry, and 6000 cavalry. The real object of the treaty, which was to involve Spain in the war against England, was cynically avowed in the eighteenth article, by which, during the present war, the Spanish obligations were only to apply to the quarrel between England and France. A scheme was prepared for a joint attack on the English coast, but it was foiled by the battle of St Vincent, in which Jervis and Nelson forced the Spanish fleet to retire to Cadiz. This defeat was the more disastrous because it cut off the connexion with the colonies and thus deprived Spain of the revenues derived from that quarter. The finances, already exhausted by extravagance and maladministration, were in no condition to meet the expenses of a naval war. England seized the opportunity to punish Spain for its conduct in the American War by encouraging discontent in the Spanish colonies, and in the Peninsula itself both nobles and people were bitterly hostile to the queen and her favourite. It was in vain that Godoy sought to secure the friendship of the reforming party by giving office to two of its most prominent members, Jovellanos and Saavedra. Spanish pride and bigotry were offended by the French occupation of Rome and the erection of a republic in the place of the papal government. The treatment of the duke of Parma by the Directory was keenly resented by the queen. Godoy found himself between two parties, the liberals and the ultramontanes, who agreed only in hatred of himself. At the same time the Directory, whose mistrust was excited by his attitude in the question of Parma, insisted upon his dismissal. Charles IV. could not venture to refuse a demand from France; the queen was alienated by Godoy's notorious infidelities; and in March 1798 he was compelled to resign his office. But he did not forfeit his hold on the king's favour, and he only waited for a favourable opportunity to emerge from his retirement.

Godoy's office was entrusted to Saavedra, but the reformers did not obtain the advantages which they expected from the change. Jovellanos was compelled in August to retire on account of ill-health,—the result, it was rumoured, of attempts on the part of his opponents to poison him. His place was taken by Caballero, an ardent opponent of reform, who restored all the abuses of the old bureaucratic administration and pandered to the most bigoted prejudices of the clergy and the court. The ministry was hopelessly divided, and the policy of the country was directed by the basest and most paltry intrigues. The only advantage which Spain enjoyed at this period was comparative independence of France. The military plans of the Directory were unsuccessful during the absence of their greatest general in Egypt, and the second coalition gained successes in 1799 which had seemed impossible since 1793. But the return of Bonaparte, followed as it was by the fall of the Directory and the establishment of the Consulate, commenced a new epoch for Spain. As soon as the First Consul had time to turn his attention to the Peninsula, he determined to restore Godoy, who had already regained the affection of the queen, and to make him the tool of his policy. Maria Louisa was easily gained over by playing on her devotion to the house of Parma, and on October 1, 1800, a secret treaty was concluded at San Ildefonso. Spain undertook to cede Louisiana and to aid France in all her wars, while Bonaparte promised to raise the duke of Parma to the rank of king and to increase his territories by the addition either of Tuscany or of the Roman Legations. This was followed by Godoy's return to power, though he left the department of foreign affairs to a subordinate. Spain was now more servile to France than ever, and in 1801 was compelled to attack Portugal in the French interests. Bonaparte was indignant against Portugal, partly because its fleet had aided his enemies in Egypt, and partly because its harbours offered great naval advantages to the English. The Spanish invasion, which was commanded by Godoy in person, met with no resistance, and the prince ventured to conclude a peace on his own authority by which Portugal promised to observe a strict neutrality on condition that its territories were left undiminished. But Bonaparte resented this show of independence, and compelled Charles IV. to refuse his ratification of the treaty. Portugal had to submit to far harsher terms, and could only purchase peace by the cession of territory in Guiana, by a disadvantageous treaty of commerce, and by a payment of twenty-five millions of francs. This insult to his ally Bonaparte followed up by others. In the preliminary treaty with England he ceded the Spanish colony of Trinidad without even consulting the court of Madrid, while he sold Louisiana to the United States in spite of his promise not to alienate it except to Spain. For these humiliations Spain had to console itself with the empty honour of being the first signatory of the treaty of Amiens.

For nearly three years Spain was allowed to remain at peace. Its finances were partially revived by the restoration of free intercourse with the colonies and by the payment of the supplies which had been withheld for the last six years. But the administration was as incompetent and misdirected as ever. Godoy, since his return to office, had abandoned all connexion with the reforming party

and had thrown himself into the reactionary policy of Caballero The Spanish church was once more placed in strict subjection to the Roman see, from which for a short time it had been freed But the worst evil lay in the undisguised domination of France, which the Government was wholly incapable of shaking off As soon as Bonaparte saw himself involved in a new war with England, he turned to Spain for assistance and extorted a new treaty (October 9, 1803), which was still more burdensome than that of 1796 Spain had to pay a monthly subsidy of six million francs, and to pledge itself to enforce a strict neutrality upon Portugal Thus the country was involved in a new and still more disastrous war with England The last remnants of its maritime power were shattered in the battles of Cape Finisterre and Trafalgar, and the English seized Buenos Ayres The popular hatred of Godoy was roused to passion by these disasters, and many competent observers believed that Spain stood on the brink of revolution At the head of the opposition was the crown prince Ferdinand, as insignificant as his rival, but endowed with all good qualities by the credulous favour of the people To maintain himself against his domestic enemies Godoy turned to France, where Bonaparte, now the emperor Napoleon I, was irritated by the crown prince's marriage with a daughter of the king of Naples The court quarrels at Madrid were fomented from Paris in order to complete the subordination of Spain Napoleon was at this time eager to humble England by excluding it from all trade with Europe The only country which had not accepted his "continental system" was Portugal, and he determined to reduce that kingdom by force It was not difficult to bribe Godoy, who was conscious that his position could not be maintained after the death of Charles IV In October 1807 Spain accepted the treaty of Fontainebleau which arranged a partition of Portugal into three parts The northern provinces were to be given to the young king of Etruria, who was to purchase them by the cession of Tuscany In the south a principality was to be carved out for Godoy himself The central district was to be kept in pledge by France until the conclusion of a general peace The treaty was hardly concluded when a French army under Junot marched through Spain to Portugal, and the royal family of that country fled to Brazil But Spain was destined to share the same fate as its neighbour The crown prince, whose wife had died in 1806, determined to imitate his rival by bidding for French support He entered into secret relations with Beauharnais, Napoleon's envoy at Madrid, and went so far as to demand the hand of a Bonaparte princess Godoy, who discovered the intrigue, induced Charles IV to order his son's arrest Napoleon at once seized the opportunity to make himself absolute master of Spain, and ordered French troops to cross the Pyrenees in support of the prince This act terrified Godoy into a reconciliation with his opponents, but the French invasion was not delayed by the removal of its pretext Charles IV and his minister, conscious that they could expect no support from the people, determined on flight The news of this intention, however, excited a popular rising in Madrid, and the king was compelled to abdicate in favour of his son Murat, however, who commanded the French, refused to be turned aside by this change of circumstances He obtained from Charles IV a declaration that his abdication had been involuntary, and occupied Madrid (March 23, 1808) Meanwhile Napoleon advanced to the frontier, and Ferdinand was lured by French agents to an interview with the emperor at Bayonne There he was confronted with his parents and Godoy, and was intimidated into restoring the crown to his father, who at once made a second abdication Napoleon now divulged the real intention of his actions, and the crown of Spain was formally conferred upon his brother Joseph Bonaparte, who two years before had been made king of Naples

Joseph Bonaparte

But Spanish loyalty was too profound to be daunted even by the awe-inspiring power of the French emperor For the first time Napoleon found himself confronted, not by terrified and selfish rulers, but by an infuriated people The rising in Spain commenced the popular movement which ultimately proved fatal to his power At first he treated the novel phenomenon with contempt, and thought it sufficient to send his less prominent generals against the rebels Madrid was taken without difficulty, but the capital was absolutely devoid of military importance, and the Spaniards showed great capacity for the guerilla warfare in the provinces The French were repulsed from Valencia, and Dupont, who had advanced into the heart of Andalusia, was compelled to retreat and ultimately to capitulate with all his forces at Baylen (July 10) The Spaniards now advanced upon Madrid and drove Joseph from the capital, which he had just entered Unfortunately the insurgents displayed less political ability than military courage The government was entrusted in Ferdinand's name to a central junta of thirty-four members, a number which was far too large for the conduct of executive business Napoleon's arrival in Spain was enough to restore victory to the French In less than a week the Spanish army was broken through and scattered, and Napoleon restored his brother in Madrid Sir John Moore, who had advanced with an English army to the relief of the capital, retired when he found he was too late, and an obstinate battle, in which the gallant general lost his life, had to be fought before the troops could secure their embarkation at Coruña Napoleon, thinking the work accomplished, had quitted the Peninsula and Soult and Victor were left to complete the reduction of the provinces The capture of Seville resulted in the dissolution of the central junta, and the Peninsula was only saved from final submission by the obstinate resistance of Wellington in Portugal and by dissensions among the French The marshals were jealous of each other, and Napoleon's plans were not approved by his brother Joseph wished to restore peace and order among his subjects in the hope of ruling an independent nation, while Napoleon was determined to annex Spain to his own overgrown empire So far did these disputes go that Joseph resigned his crown, and was with difficulty induced to resume it Meanwhile Cadiz became the capital of what was left of independent Spain, and there the cortes met in 1810 for the purpose of drawing up a new constitution The fall of the old monarchy and the exigencies of self defence had given to the reforming party an ascendency which they had never before possessed In the constitution which was promulgated early in 1812 the principles of the French constituent assembly were closely followed The Inquisition had already perished, and the last relics of the old autocratic government shared its fate Supreme legislative power was placed in the hands of a single national assembly, and effective checks were devised to restrict the power of the monarchy whenever it should be revived The freedom of the press was established, and the property of the clergy was confiscated to defray the expenses of the war The great defect of the constitution was that it was the work of one party, to which circumstances had given a temporary supremacy, and it failed to command the support of the united nation The nobles and priests were bitterly hostile, and the latter had more influence in Spain than in any European country except Ireland

The restoration of Spanish independence could hardly

have been accomplished without the assistance of England Wellington had already made two attempts to advance from Portugal into the adjacent kingdom, but had been foiled by superior forces In 1812 he determined on a great effort He secured his base of operations by the capture of Ciudad Rodrigo and Badajoz, and at Salamanca he completely routed the opposing army of Marmont This victory enabled the English general to enter Madrid (August 12), and Joseph retreated to Valencia But further advance was prevented by the concentration of the French forces in the east, and Wellington found it advisable to retire for the third time to winter-quarters on the Portuguese frontier It was during this winter that Napoleon suffered his first and greatest reverse in the retreat from Moscow and the destruction of his grand army This was the signal for the outbreak of the "war of liberation" in Germany, and French troops had to be withdrawn from Spain to central Europe For the first time Wellington found himself opposed by fairly equal forces In the spring of 1813 he advanced from Ciudad Rodrigo and defeated Jourdan at Vittoria, the battle which finally decided the Peninsular War Joseph retired altogether from his kingdom, and Wellington, eager to take his part in the great European contest, fought his way through the Pyrenees into France Napoleon, who had suffered a crushing defeat at Leipsic, hastened to recognize the impossibility of retaining Spain by releasing Ferdinand VII, who returned to Madrid in March 1814

Ferdinand VII

After the convulsions it had endured Spain required a period of firm but conciliatory government, but the ill-fate of the country gave the throne at this crisis to the worst of her Bourbon kings Ferdinand VII had never possessed the good qualities which popular credulity had assigned to him, and he had learnt nothing in his four years' captivity except an aptitude for lying and intrigue He had no conception of the duties of a ruler, his public conduct was regulated by pride and superstition, and his private life was stained by the grossest sensual indulgence Spain was still governed under the constitution of 1812, but the king's first act was to dissolve the cortes and to abrogate the constitution, promising, however, to grant a new one in its place But no sooner was he established on the throne, and conscious of the strong reaction in favour of the monarchy, than he threw his promises to the wind and set himself to restore the old absolutism with all its worst abuses The nobles recovered their privileges and their exemption from taxes, the monasteries were restored, the Inquisition resumed its activity, and the Jesuits returned to Spain The liberals were ruthlessly persecuted, together with all who had acknowledged Joseph Bonaparte A *camarilla* of worthless courtiers and priests conducted the government, and urged the king to fresh acts of revolutionary violence For six years Spain groaned under a royalist "reign of terror," and isolated revolts only served as the occasion for fresh cruelties The finances were squandered in futile expeditions to recover the South American colonies, which had taken advantage of Napoleon's conquest of Spain to establish their independence In his straits for money Ferdinand ventured to outrage national sentiment by selling Florida to the United States in 1819 Discontent found expression in the formation of secret societies, which were especially powerful among the neglected and ill-paid soldiers At last, in 1820, Riego and Quiroga, two officers of an expedition which had been prepared for South America, raised the standard of revolt in Cadiz Ferdinand and his advisers proved as incapable as they were tyrannical, and their feeble irresolution enabled the movement to spread over the whole country In March the king gave way and accepted the constitution of 1812 The royalists or *serviles*, as they were called, were dismissed from office and their places taken by liberals The cortes met in July, and at once proceeded to dissolve the monasteries and the Inquisition, to confiscate the clerical tithes, to abolish entails, and to secure the freedom of the press and of popular meetings Great results might have been achieved if the moderate party, under Martinez de la Rosa, had been able to grapple with the task of suppressing disorder and establishing a permanent constitution But this was the last thing which the king desired, and the moderates were defeated by a factious combination of the *serviles* and the radicals Risings took place among the loyal and bigoted peasants of the provinces, and their suppression contributed to the victory of the extreme party, which seemed to be secured in 1822 by the election of Riego as president of the cortes

But Spain was not allowed to work out its own salvation Europe was dominated at this time by the Holy Alliance, which disguised a resolution to repress popular liberties and to maintain despotism under a pretended zeal for piety, justice, and brotherly love At the congress of Verona (October 1822) France, Austria, Russia, and Prussia agreed upon armed intervention in Spain, in spite of the protest of Canning on the part of England Spain was to be called upon to alter her constitution and to grant greater liberty to the king, and if an unsatisfactory answer were received France was authorized to take active measures The demand was unhesitatingly refused, and a French army, 100,000 strong, at once entered Spain under the duke of Angoulême (April 1823) No effective resistance was made, and Madrid was entered by the invaders (May 23) The cortes, however, had carried off the king to Seville, whence they again retreated to Cadiz The bombardment of that city terminated the revolution and Ferdinand was released (October 1) His first act was to revoke everything that had been done since 1819 The Inquisition was not restored, but the secular tribunals took a terrible revenge upon the leaders of the rebellion. The protest of the duke of Angoulême against these cruelties was unheeded Even the fear of revolt, the last check upon despotism, was removed by the presence of the French army, which remained in Spain till 1827 But Spain had to pay for the restoration of the royal absolutism, as Canning backed up his protest against the intervention of France by acknowledging the independence of the Spanish colonies

Ferdinand VII was enabled to finish his worthless and disastrous reign in comparative peace In 1829 he married a fourth wife, Maria Christina of Naples, and at the same time he issued a "Pragmatic Sanction" abolishing the Salic law in Spain No one expected any practical results from this edict, but a formal protest was made against it by the king's brothers, Carlos and Francisco, and also by the French and Neapolitan Bourbons In the next year, however, the queen gave birth to a daughter, Isabella, who was proclaimed as queen on her father's death in 1833, while her mother undertook the office of regent Don Carlos at once asserted his intention of maintaining the Salic law, and rallied round him all the supporters of absolutism, especially the inhabitants of the Basque Provinces Christina was compelled to rely upon the liberals, and to conciliate them by the grant of a constitution, the *estatuto real*, which established two chambers chosen by indirect election But this constitution, drawn up under the influence of Louis Philippe of France, failed to satisfy the advanced liberals, and the Christinos split into two parties, the *moderados* and *progresistas* In 1836 the latter party extorted from the regent the revival of the constitution of 1812 All this time the Government was involved in a desperate struggle

Isabella II

with the Carlists, who at first gained considerable successes under Zumalacarregui and Cabrera. But the death of Zumalacarregui in 1835 and the support of France and England ultimately gave the regent the upper hand, and in 1839 her general, Espartero, forced the Basque Provinces to submit to Isabella. Don Carlos renounced his claims in favour of his eldest son, another Carlos, and retired to Trieste, where he died in 1855. Christina now tried to sever herself from the *progresistas*, and to govern with the help of the moderate party who enjoyed the patronage of Louis Philippe. But England, jealous of French influence at Madrid, threw the weight of her influence on to the side of the radicals, who found a powerful leader in Espartero. In 1840 Christina had to retire to France, and Espartero was recognized as regent by the cortes. But his elevation was resented by the other officers, while his subservience to England made him unpopular, and in 1843 he also had to go into exile. Isabella was now declared of age. Christina returned to Madrid, and the *moderados* under Narvaez obtained complete control over the government. This was a great victory for France, and Louis Philippe abused his success by negotiating the infamous "Spanish marriages." A husband was found for Isabella in her cousin, Francis of Assis, whose recommendation in French eyes was the improbability of his begetting children. On the same day the queen's sister, Maria Louisa, was married to Louis Philippe's son, the duke of Montpensier. By this means it was hoped to secure the reversion of the Spanish throne for the house of Orleans. The scheme recoiled on the heads of those who framed it. The alienation of England gave a fatal impulse to the fall of Louis Philippe, while the subsequent birth of children to Isabella deprived the Montpensier marriage of all importance.

Spanish history during the reign of Isabella II. presents a dismal picture of faction and intrigue. The queen herself sought compensation for her unhappy marriage in sensual indulgence, and tried to cover the dissoluteness of her private life by a superstitious devotion to religion and by throwing her influence on to the side of the clerical and reactionary party. Every now and then the *progresistas* and *moderados* forced themselves into office, but their mutual jealousy prevented them from acquiring any permanent hold upon the government. In 1866 Isabella was induced to take vigorous measures against the liberal opposition. Narvaez was appointed chief minister, and the most prominent liberals, Serrano, Prim, and O'Donnell, had to seek safety in exile. The cortes were dissolved, and many of the deputies were transported to the Canary Islands. The ascendency of the court party was maintained by a rigorous persecution, which was continued after Narvaez's death (April 1868) by Gonzales Bravo. Common dangers succeeded at last in combining the various sections of the liberals for mutual defence, and the people, disgusted by the scandals of the court and the contemptible *camarilla* which surrounded the queen, rallied to their side. In September 1868 Serrano and Prim returned to Spain, where they raised the standard of revolt and offered the people the bribe of universal suffrage. The revolution was speedily accomplished, and Isabella fled to France, but the successful rebels were at once confronted with the difficulty of finding a successor for her. During the interregnum Serrano undertook the regency, and the cortes drew up a new constitution, by which an hereditary king was to rule in conjunction with a senate and a popular chamber. As no one of the Bourbon candidates for the throne was acceptable, it became necessary to look round for some foreign prince. The offer of the crown to Leopold of Hohenzollern-Sigmaringen excited the jealousy of France, and gave Napoleon III. the opportunity of picking a quarrel, which proved fatal to himself, with the rising state of Prussia. At last a king was found Amadeus
(1870) in Amadeus of Aosta, the second son of Victor Emmanuel, who made an honest effort to discharge the difficult office of a constitutional king in a country which was hardly fitted for constitutional government. But he found the task too hard and too distasteful, and resigned in 1873. A provisional republic was now formed, of which Castelar was the guiding spirit. But the Spaniards, trained to regard monarchy with superstitious reverence, had no sympathy with republican institutions. Don Carlos seized the opportunity to revive the claim of inalienable male succession, and raised the standard of revolt in the Basque Provinces, where his name was still a power. The disorders of the democrats and the approach of civil war threw the responsibility of government upon the army. The cortes were dissolved by a military *coup d'état*, Castelar threw up his office in disgust, and the administration was undertaken by a committee of officers. Anarchy was suppressed with a strong hand, but it was obvious that order could only be restored by reviving the monarchy. Foreign princes were no longer thought of, and the crown was offered to and accepted by Alfonso XII., the young Alfonso
son of the exiled Isabella (1874). His first task was to XII.
terminate the Carlist War, which still continued in the north, and this was successfully accomplished in 1876. Time was required to restore the prosperity of Spain under a peaceful and orderly government and to consolidate by prescription the authority of the restored dynasty. Unfortunately a premature death carried off Alfonso XII. in 1885, before he could complete the work which circumstances laid upon him. The regency was entrusted to his widow, Christina of Austria, and the birth of a posthumous son (May 17, 1886), who is now the titular king of Spain, has excited a feeling of pitying loyalty which may help to secure the Bourbon dynasty in the last kingdom which is left to it.

Revolution*; Lauser, *Geschichte Spaniens von dem Sturz Isabellas*. (R. L.)

PART III.—LANGUAGE.

The Iberian Peninsula is not a linguistic unity. Not to speak of the Basque, which still forms an island of some importance in the north-west, three Romance languages share this extensive territory:—(1) Portuguese-Galician, spoken in Portugal, Galicia, and a small portion of the province of Leon; (2) Castilian, covering about two-thirds of the Peninsula in the north, centre, and south; (3) Catalan, occupying a long strip of territory to the east and south-east.

These three varieties of the *Romana Rustica* are marked off from one another much more distinctly than is the case with, say, the Romance dialects of Italy; they do not interpenetrate one another, but where the one ends the other begins. It has only been possible to establish at the points of junction of two linguistic regions the existence of certain mixed jargons in which certain forms of each language are intermingled; but these jargons, called into existence for the necessities of social relations by bilinguists, have an essentially individualistic and artificial character. The special development of the vulgar

Latin tongue in Spain, and the formation of the three linguistic types just enumerated, were promoted by the peculiar political circumstances From the 9th century onwards Spain was slowly recaptured from the Mohammedans, and the Latin spoken by the Christians who had taken refuge on the slopes of the Pyrenees was slowly carried back to the centre and ultimately to the south of the Peninsula, whence it had been driven by the Arab invasion Mediæval Spain divides itself into three *conquistas*—that of Castile (much the most considerable), that of Portugal, and that of Aragon, and to these three political conquests correspond an equal number of linguistic varieties If a given province now speaks Catalan rather than Castilian, the explanation is to be sought simply and solely in the fact that it was conquered by a king of Aragon and peopled by his Catalan subjects

I CATALAN —This domain now embraces, on the main land, the Spanish provinces of Gerona, Barcelona, Tarragona, and Lerida (the old principality of Catalonia), and of Castellon de la Plana, Valencia, and Alicante (the old kingdom of Valencia), and, in the Mediterranean, that of the Balearic Islands (the old kingdom of Majorca) Catalan, by its most characteristic features, belongs to the Romance of southern France and not to that of Spain, it is legitimate, therefore, to regard it as imported into Spain by those *Hispani* whom the Arab conquest had driven back beyond the mountains into Languedoc, and who in the 9th century regained the country of their origin, this conclusion is confirmed by the fact that the dialect is also that of two French provinces on the north of the Pyrenees—Roussillon and Cerdagne From the 9th to the 12th century Catalan spread further and further within the limits of Catalonia, properly so called, in 1229 it was brought to Majorca by Jaime el Conquistador, and in 1238 the same sovereign carried it to Valencia also Even Murcia was peopled by Catalans in 1266, but this province really is part of the Castilian conquest, and accordingly the Castilian element took the upper hand and absorbed the dialect of the earlier colonists The river Segura, which falls into the Mediterranean in the neighbourhood of Orihuela, a little to the north of Murcia, is as nearly as possible the southern boundary of the Catalan domain, westward the boundary coincides pretty exactly with the political frontier, the provinces of New Castile and Aragon not being at all encroached on Catalan, which by the reunion of Aragon and the countship of Barcelona in 1137 became the official language of the Aragonese monarchy,—although the kingdom of Aragon, consisting of the present provinces of Saragossa, Huesca, and Teruel, has always been Castilian in speech,—established a footing in Italy also, in all parts where the domination of the kings of Aragon extended, viz, in Sicily, Naples, Corsica, and Sardinia, but it has not maintained itself there in modern times except in a single district of the last-named island (Alghero), everywhere else in Italy, where it was not spoken except by the conquerors, nor written except in the royal chancery, it has disappeared without leaving a trace

From the 13th century the name given to the vulgar tongue of eastern Spain has been *Catalanesch* (*Catalaniscus*) or *Catalá* (*Catalanus*),—the idiom of the Catalans [1] By Catalanesch or Catalá was understood, essentially, the spoken language and the language of prose, while that of poetry, with a large admixture of Provençal forms, was early called *Lemosi*, *Limosi*, or language of Limousin,—Catalan grammarians, and particularly the most celebrated of them, Ramon Vidal de Besalú, having adopted *Lemosi* as the generic name of the language of the troubadours These grammarians carefully distinguish the vulgar speech, or *pla Catalá*, from the refined *trobar* idiom, which originally is simply a more or less modified form of Provençal Afterwards, and especially in these parts of the Catalan domain outside of Catalonia which did not care to acknowledge that they derived their language from that province, *Lemosi* received a more extensive signification, so as to mean the literary language in general, whether of verse or of prose To this hour, particularly in Valencia and the Balearics, *Lemosi* is employed to designate on the one hand the old Catalan and on the other the very artificial and somewhat archaizing idiom which is current in the "Jochs florals", while the spoken dialect is called, according to the localities, *Valenciá* (in Valencia), *Majorquí* and *Menorquí* (in Majorca and Minorca), or *Catalá* (in Catalonia), the form *Catalanesch* is obsolete

The principal features which connect Catalan with the Romance of France and separate it from that of Spain are the following (1) To take first its treatment of the final vowels,—Catalan, like French and Provençal, having only oxytones and paroxytones, does not tolerate more than one syllable after the tonic accent thus *anima* gives *arma*, *cámera* gives *cambra* All the proparoxytones of modern Catalan are of recent introduction and due to Castilian influence Further, the only post-tonic Latin vowel preserved by the Catalan is, as in Gallo Roman, *a* *mare* gives *mar*, *gratu(s)* gives *grat*, but *anima* gives *arma*, and, when the word terminates in a group of consonants requiring a supporting vowel, that vowel is represented by an *e* *arb(o)rem*, Cat *arbre* (Prov and Fr *arbre*, but Cast *árbol*), *pop(u)l(us)*, Cat *poble* (Prov *poble*, Fr *peuple*, but Cast. *pueblo*), sometimes, when it is inserted between the two consonants instead of being made to follow them, the supporting vowel is represented by an *o* *escándol* (scándalum), *frèvol* (frivolus), *cércol* (circulus) In some cases a post-tonic vowel other than *a* is preserved in Catalan, as, for example, when that vowel forms a diphthong with the tonic (*Deu*, Deus, *Ebreu*, Hebreus), or, again, it sometimes happens, when the tonic is followed by an *i* in hiatus, that the *i* persists (*dilúvi*, dilúvium, *servici*, servicium, *lábi*, lábium, *ciri*, cereus), but in many cases these ought to be regarded as learned forms, as is shown by the existence of parallel ones, such as *servey*, where the atonic *i* has been attracted by the tonic and forms a diphthong with it (*servíci*, *servii*, *servey*) What has just been said as to the treatment of the final vowels in Catalan must be understood as applying only to pure Catalan, unaltered by the predominance of the Castilian, for the actual language is no longer faithful to the principle we have laid down, it allows the final *o* atonic in a number of substantives and adjectives, and in the verb it now conjugates *canto*, *temo*, *sento*,—a thing unknown in the ancient language (2) As regards conjugation, only two points need be taken up here —(*a*) it employs the form known as the inchoative, that is to say, the lengthening of the radical of the present in verbs of the third conjugation by means of the syllable *ex* or *ix*, a proceeding common to Italian, Walachian, Provençal, and French, but altogether unknown in Hispanic Romance, (*b*) the formation of a great number of past participles in which the termination is added, as in Provençal, not to the radical of the verb, but to that of the perfect *tingut* formed from *tinch*, *pogut* from *poch*, *conegut* from *conech*, while Castilian says *tenido* (formerly also *tenudo*), *podido*, *conocido*, that is to say, it forms those participles from the infinitive

As for features common alike to Catalan and Hispanic (Castilian and Portuguese) Romance, on the other hand, and which are unknown to French Romance, there is only one which possesses any importance, the conservation, namely, of the Latin *u* with its original sound, while the same vowel has assumed in French and Provençal, from a

[1] The origin of the name *Catalanus* is unknown

very early period,—earlier doubtless than the oldest existing monuments of those languages,—a labio-palatal pronunciation (*ü*). It is not to be supposed that the separation of Catalan from the Gallo-Roman family should have occurred before the transformation had taken place; there is good reason to believe that Catalan possessed the *ü* at one time, but afterwards lost it in its contact with the Spanish dialects. The question, however, is one for further examination.

Catalan being a variety of the *langue d'oc*, it will be convenient to note the peculiarities of its phonetic and inflexion as compared with ordinary Provençal.

Tonic Vowels.—With regard to *a*, which is pronounced alike in open and close syllables (*amar*, amare, *abre*, arbor), there is nothing to remark. The Latin ē, which is treated like ĭ, gives *e*, sometimes close, sometimes open. On this point Catalan is more hesitating than Provençal; it does not distinguish so clearly the pronunciation of *e* according to its origin; while ē (ĭ) is capable of yielding an open *e*, the ĕ is often pronounced close, and the poets have no difficulty in making words in *e* close and in *e* open rhyme together, which is not the case in Provençal. The Latin ĕ never yields *ie* in Catalan as it does in French and occasionally in Provençal; sedet becomes *seu* (where *u* represents the final *d*), pedem makes *peu*, and ego *eu*; in some words where the tonic ĕ is followed by a syllable in which an *i* occurs, it may become *i* (*ir*, hĕri, *mig*, mĕdius, *mils*, mĕlius), and the same holds good for ē in a similar situation (*ciri*, cēreus, cēreus, *fira*, fēria), and for *e* in a close syllable before a nasal (*exempli*, exemplum, *mintré* for *mentiré*, *gint* for *gent*). *I* tonic long and *i* short, when in hiatus with another vowel, produce *i* (*amich*, amicus, *via*, vĭa). *O* tonic long and *o* short are represented by *o* close and *o* open (*amor*, amorem, *poble*, populus). *O* short is never diphthongized into *uo* or *ue*, such a treatment is as foreign to Catalan as the diphthongization of ĕ into *ie*. Just as *e* before a syllable in which an *i* occurs is changed into *i*, so in the same circumstances o becomes *u* (*full*, folium, *vull*, volio for voleo) and also when the accented vowel precedes a group of consonants like *cl*, *pl*, and the like (*ull*, oc'lus, *escull*, scop'lus). Latin *u* persists with the Latin pronunciation, and, as already said, does not take the Franco-Provençal pronunciation *ü*. Latin *au* becomes *o* (*cosa*, causa, *or*, aurum); Old Catalan has kept the diphthong better, but possibly we should attribute the examples of *au* which are met with in texts of the 13th and 14th centuries to the literary influence of Provence. Latin *ua* tends to become *o* (*cor*, quare).

Atonic Vowels.—As for the Latin post-tonic vowels already spoken of, it remains to be noted that *a* is often represented in writing by *e*, especially before *s*; in old Catalan, the substantives, adjectives, and participles readily form their singular in *a* and their plural in *es*: *arma*, *armes* (anima, animas), *bona*, *bones* (bona, bonas), *amada*, *amades* (amata, amatas). This *e* is neither open nor close, but a surd *e* the pronunciation of which comes very near *a*. In the same way the supporting vowel, which is regularly an *e* in Catalan, is often written *a*, especially after *r* (*arbra*, arborem, *astra*, astrum, *para*, patrem); one may say that in the actual state of the language post-tonic *e* and *a* become indistinguishable in a surd sound intermediate between the French *a* and mute *e*. Before the tonic the same change between *a* and *e* constantly takes place; one finds in manuscripts *enar*, *emor* for *anar*, *amor* (the same manner of writing extends even to the case of the tonic syllable, *ten* and *sent* from tantum and sanctum being far from rare), and, on the other hand, *antre*, *arrar*, for *entre*, *errar*. *I* atonic is often represented by *e* even when it is long (*vehi*, vicinus). *O* atonic close, which in genuine Catalan exists only before the tonic, has become *u*; at the present day *truvar*, *cuntradir* is the real pronunciation of the words spelt *trovar*, *contradir*, and in the final syllables, verbal or other, where under Castilian influence an *o* has come to be added to the normal Catalan form, this *o* has the value of a *u*: *trovo* (genuine Catalan, *trop*) is pronounced *trovu*, *bravo* (genuine Catalan, *brau*) is pronounced *bravu*. *U* atonic keeps its ground.

The only strong diphthongs of the spoken language are *ái*, *áu* (rather rare), *ei*, *éu*, *íu*, *ói*, *óu*, *úi*, *úu*. *Ai* produced by *a* + *i* or by *a* + a palatal consonant has for the greater part of the time become an *e* in the modern language; *factum* has yielded *fait*, *feit*, and then *fet*, the last being the actual form; *arius* has given *er* alongside of *aire*, *ari*, which are learned or semi-learned forms. Of the two weak diphthongs *ió* and *uá*, the latter, as has been seen, tends to become *o* close in the atonic syllable, and is pronounced *u*: *quaranta* has become *coranta*, then *curanta*. After the tonic *ua* often becomes *a* in the Catalan of the mainland (*ayga*, aqua, *llenga*, lingua), while in Majorca it becomes *o* (*aygo*, *llengo*).

Consonants.—Final *t* readily disappears after *n* or *l* (*tan*, tantum, *aman*, *venin*, *partin*, for *amant*, *venint*, &c., *mol*, multum, *ocul*, ocultum); the *t* reappears in composition before a vowel (*fon*, fontem, but *Font alba*). On the other hand, a *t* without etymological origin is frequently added to words ending in *r* (*cart* for *car*, quare, *mart* for *mar*, mare, *amart*, *ohirt*, infinitive for *amar*, *ohir*), and even to some words terminating in a vowel (*genit*, ingenium, *premit*, premium), or the addition of the *t* has taken place by assimilation to past participles in *it*. The phenomenon occurs also in Provençal (see *Romania*, vii. 107, viii. 110). Median intervocal *d*, represented by *s* (*z*) in the first stage of the language, has disappeared: fidelis gave *fesel*, then *feel*, and finally *fel*; videtis became *vezets*, then *veets*, *vets*, and *veu*. Final *d* after a vowel has produced *u* (*peu*, pedem, *niu*, nidum, *mou*, modum), but, when the *d*, in consequence of the disappearance of the preceding vowel, rests upon a consonant, it remains and passes into the corresponding surd: frigidus gives *fred* (pronounced *fret*). The group *dr*, when produced by the disappearance of the intermediate vowel, becomes *ur* (*creure*, credere, *ociure*, occidere, *veure*, vidēre, *seure*, sedēre). Final *n*, if originally it stood between two vowels, falls away (*bo*, bonum, *vi*, vinum), but not when it answers to *mn* (thus donum makes *do*, but domnum *don*, sonum makes *so*, but somnum *son*). *Nd* is reduced to *n* (*demanar*, *comanar* for *demandar*, *comandar*). Assibilated *c* before *e*, *i* is treated like *d*; within a word it disappears after having been represented for a while by *s* (lucere gives *lluser*, *lluhir*, recipere gives *rezebre*, *reebre*, *rebre*), at the end of a word it is replaced by *u* (*veu*, vicem, *feu*, fecit). The group *c'r* gives *ur*, just like *d'r* (*jaure*, jacēre, *naure*, nocēre, *plaure*, placēre, but facere, dicere, ducere, make *far* (*fer*), *dir*, *dur*. Initial *l* has been preserved only in certain monosyllables (the article *lo*, *los*); everywhere else it has been replaced by *l mouillée* (Prov. *lh*), which in the present orthography is written *ll* as in Castilian, but formerly used to be represented by *ly* or *yl* (*lletra*, litera, *llengua*, lingua). *P* readily disappears after *m*, like *t* after *n* (*cam*, campum, *tems*, tempus). *B* is replaced by the surd *p* at the end of a word (*trobar* in the infinitive, but *trop* in the present tense), so also in the interior of a word when it precedes a consonant (*supvenir*, subvenire, *sopte*, sub'to). Median intervocalic *f* gives *v* (*Estéve*, Stephanus); it has disappeared from profundus, which yielded the form *preon*, then *pregon* (*g* being introduced to obviate the hiatus). *V*, wherever it has been preserved, has the same pronunciation as *b*; at the end of a word and between vowels it becomes vocalized into *u* (*suau*, suavis, *viure*, vivere). *C* guttural, written *qu* before *e* and *i*, keeps its ground as a central and as a final letter; in the latter position it is generally written *ch* (*amich*, amicum, *joch*, jocum). *G* guttural is replaced as a final letter by surd *c* (*longa*, but *lonc*; *trigar*, but *trich*). *Tj* after a consonant gives *ss* (*cassar*, captiare); between vowels, after having been represented by soft *s*, it has disappeared (rationem gave *razó*, *raysó*, then *rahó*); at the end of every word it behaves like *ts*, that is to say, changes into *u* (*preu*, pretium); instead of *ts* the second person plural of the verb—at(i)s, et(i)s, it(i)s—now has *au*, *eu*, *iu* after having had *ats*, *ets*, *its*. *Dj* gives *ǵ* between vowels (*verger*, viridiarium), and *ć* as a terminal (written either *ig* or *tx*: *goig*, gaudium, *mig*, *mitx*, medium). *Stj* and *sc* before *e* and *i*, as well as *x* and *ps*, yield the sound *sh*, represented in Catalan by *x* (*angoxa*, angustia, *conexer*, cognoscere, *dix*, dixit, *mateix*, metipse). *J* almost everywhere has taken the sound of the French *j* (*jutge*, &c.). *Lj* and *ll* give *l* mouillée (*ll* in the present orthography: *fill*, filium, *consell*, consilium, *null*, nullum). In the larger portion of the Catalan domain this *l* mouillée has become *y*; almost everywhere *fiy* is pronounced for *fill*, *consey* for *consell*. *Nj* and *nn* give *n* mouillée (*ny* in both old and modern spelling: *senyor*, seniorem, *any*, annum). Sometimes the *ny* becomes reduced to *y*; one occasionally meets in manuscripts with *seyor*, *ay*, for *senyor*, *any*, but this pronunciation has not become general, as has been the case with the *y* having its origin in *ll*. Lingual *r* at the end of a word has a tendency to disappear when preceded by a vowel: thus the infinitives amare, temere, *legire are pronounced *amá*, *temé*, *llegí*. It is never preserved except when protected by the non-etymological *t* already spoken of (*llegirt* or *llegt*, but never *llegir*); the *r* reappears, nevertheless, whenever the infinitive is followed by a pronoun (*donarme*, *dirho*). *Rs* is reduced to *s* (*cos* for *cors*, corpus). *H* is merely an orthographic sign; it is used to indicate that two consecutive vowels do not form a diphthong (*vehi*, *rahó*), and, added to *c*, it denotes the pronunciation of the guttural *c* at the end of a word (*amich*).

Inflexion.—Catalan, unlike Old Provençal and Old French, has never had declensions. It is true that in certain texts (especially metrical texts) certain traces of case-endings are to be met with, as for example *Deus* and *Deu*, *amors* and *amor*, *clars* and *clar*, *forts* and *fort*, *tuyt* and *tots*, *abduy* and *abdos*, *senyer* and *senyor*, *emperaire* and *emperador*, but, since these forms are used convertibly, the nominative form when the word is in the objective, and the accusative form when the word is the subject, we can only recognize in these cases a confused recollection of the Provençal rules known only to the literate but of which the transcribers of manuscripts took no account. Catalan, then, makes no distinctions save in the gender and the number of its nouns. As regards the formation of the plural only two observations are necessary. (1) Words which have their radical termination in *n* but which in the singular

drop that *n*, resume it in the plural before *s*. *homin-em* makes *ome* in the singular and *omens* in the plural, *asin-um* makes *ase* and *asens*. (2) Words terminating in *s* surd or sonant and in *x* anciently formed their plural by adding to the singular the syllable *es* (*bras, brasses*, *pres, preses*, *mateix, mateixes*), but subsequently, from about the 15th century, the Castilian influence substituted *os*, so that one now hears *brassos, presos, mateixos*. The words in *ix, sc, st* have been assimilated to words in *s* (*ç*), from *bosch* we originally had the plural *bosches*, but now *boscos*, from *trist*, *tristes*, but now *tristos*. For these last in *st* there exists a plural formation which is more in accordance with the genius of the language, and consists in the suppression of the *s* before the *t*, from *aquest*, for example, we have now side by side the two plurals *aquestos*, in the Castilian manner, and *aquets*. The article is *lo, los* (pronounced *lu, lus* in a portion of the domain), fem *la, les* (*las*). Some instances of *li* occur in the ancient tongue, applying indifferently to the nominative and the objective case, *el* applying to the singular is also not wholly unknown. On the north-western border of Catalonia, and in the island of Majorca, the article is not a derivative from *ille* but from *ipse* (sing masc *es* or *so*, fem *sa*, pl masc *es*, and also *ets*, which appears to come from *istos*,—*ets* for *ests*, like *aquets* for *aquests*,—fem *sas*). Compare the corresponding Sardinian forms *su, sa*, pl *sos, sas*. On the pronouns it has only to be remarked that the modern language has borrowed from Castilian the composite forms *nosaltres* and *vosaltres* (pronounced also *nosaltros* and *nosatrus*), as also the form *voste, vuste* (Castilian *usted* for *vuestra merced*).

Conjugation.—Catalan, and especially modern Catalan, has greatly narrowed the domain of the 2d conjugation in ēre, a large number of verbs of this conjugation have been treated as if they belonged to the 3d in ĕre, debere makes *deure*, videre, *veure*, and alongside of *haber*, which answers to habēre, there is a form *heure* which points to habĕre. A curious fact, and one which has arisen since the 15th century, is the addition of a paragogic *r* to those infinitives which are accented on the radical, in a portion of the Catalan domain one hears *creurer*, *veurer*. Some verbs originally belonging to the conjugation in ēre have passed over into that in *ir*, for example tenēre gives *tenir* alongside of *tindre*, remanēre *romanir* and *romandre*. In the gerundive and in the present participle Catalan differs from Provençal in still distinguishing the conjugation in *ir* from that in *er*, *re*,—saying, for example, *sentint*. As in Provençal, the past participle of a large number of verbs of the 2d and 3d conjugations is formed, not from the infinitive, but from the perfect (*pogut, volgut, tingut* suggest the perfects *poch, volch, tinch*, and not the infinitives *poder, voler, tenir*). In the present indicative and subjunctive many verbs in *ir* take the inchoative form already described, by lengthening the radical in the three persons of the singular and in the third person of the plural by means of the syllable *esc* (*isc*): *agrahir* has the present indicative *agraesch, agraheixes, agraheix, agraheixen*, the present subjunctive *agraesca, -as, -a, -an* (or more usually now *agraesqui, -is, -i, -in*). The old perfect of the conjugation in *ar* had *e* (also *i*) in the 1st pers sing and *-a* in the 3d, alongside of the *-a*, which is proper to Catalan exclusively, we also find, in the first period of the language, *-et* as in Provençal. Subsequently the perfect of the three conjugations has admitted forms in *-r* (*amares, amarem, amareu, amaren*), derived from the ancient pluperfect *amara*, &c, which has held its ground down to the present day, with the meaning of a conditional in some verbs (one still hears *fora, haguera*). But the simple perfect is no longer employed in the spoken language, which has substituted for it a periphrastic perfect, composed of the infinitive of the verb and the present of the auxiliary *anar*: *vaig pendre*, for example, does not mean "I am going to take," but "I have taken." The earliest example of this periphrastic perfect carries us back to the 15th century. The most usual form of the subj pres in spoken Catalan is that in *-i* for all the three conjugations (*ami, -is, -i, -em, -eu, -in*; *temi, -is*, &c; *senti, -is*, &c), it appears to be an abbreviation from *-ia*, and in effect certain subjunctives, such as *cantia, temia, tinguia, vinguia* (for *cante, tema, tinga, vingia*), evidently formed upon *sia* (subj of *esser*), have been and still are used. The same *i* of the present subjunctive, whatever may be its origin, is still found in the imperfect: *ames, -essis, -es, -essim*, &c.

Catalan Dialect of Alghero (*Sardinia*).—As compared with that of the mainland, the Catalan of Alghero, introduced into this portion of Sardinia by the Aragonese conquerors and colonists, does not present any very important differences, some of them, such as they are, are explicable by the influence of the indigenous dialects of Sassari and Logudoro. In phonetics one observes—(1) the change of *lj* into *y* as an initial before *i* (*yitx, yigis, lego, legis*), a change which does not take place in the Catalan of the mainland except in the interior, or at the end of the word, (2) the frequent change of *l* between vowels and of *l* after *c, g, f, p* or *b* into *r* (*taura, tabula*, *candera, candela*, *sangrot, singultum*, *frama, flama*). In conjugation there are some notable peculiarities. The 1st pers sing does not take the *o* which continental Catalan has borrowed from Castilian (*cant*, not *canto*, &c), the imp ind of verbs of the 2d and 3d conjugations has *era, ira* instead of *ia*, a form which also occurs in the conditional (*cantaria, dormiria*), the simple perfect, of which some types are still preserved in the actual language (*e g*, *anghe, aghe*), has likewise served for the formation not only of the past participle but also of the infinitive (*agher*, *habere*, can only be explained by *ach*, 3d person of the perfect), the infinitives with *r* paragogic (*viurer, seurer, plourer*) are not used (*viure, seure, ploure* instead), in the conjugation of the present of the verb *essar* or *esser*, the 2d pers sing *ses* formed upon the persons of the plural, while continental Catalan says *ets* (anciently *est*), as also, in the plural, *sem, seu*, instead of *som, sou*, are to be noted, *tenere* has passed over to the conjugation in *re* (*trenda*=*tendre*), but it is at the same time true that in ordinary Catalan also we have *tindrer* alongside of *tenir* the habitual form, *dicere* gives not *dir* but *diure*, which is more regular.

II. Castilian.—This name (derived from the kingdom of Castile, the most powerful element in the Spanish monarchy) is the most convenient designation to apply to the linguistic domain which comprises the whole of central Spain and the vast regions of America and Asia colonized from the 16th century onwards by the Spaniards. We might also indeed call it the *Spanish* domain, narrowing the essentially geographical meaning of the word *Español* (derived, like the other old form *Españon*, from *Hispania*), and using it in a purely political sense. But the first expression is to be preferred, all the more because it has been long in use, and even the inhabitants of the domain outside the two Castiles fully accept it and are indeed the first to call their idiom *Castellano*. It is agreed on all hands that Castilian is one of the two branches of the vulgar Latin of Spain, Portuguese-Galician being the other, both idioms, now separated by very marked differences, can be traced back directly to one common source—the Hispanic Romance. One and the same vulgar tongue, diversely modified in the lapse of time, has produced Castilian and Portuguese as two varieties, while Catalan, the third language of the Peninsula, connects itself, as has already been pointed out, with the Gallo-Roman.

Within the Castilian domain, thus embracing all in Spain that is neither Portuguese nor Catalan, there exist linguistic varieties which it would perhaps be an exaggeration to call dialects, considering the meaning ordinarily attached to that word, but which are none the less worthy of attention. Generally speaking, from various circumstances, and especially that of the reconquest, by which the already-formed idiom of the Christian conquerors and colonists was gradually conveyed from north to south, Castilian has maintained a uniformity of which the Romance languages afford no other example. We shall proceed in the first instance to examine the most salient features of the *normal Castilian*, spoken in the provinces more or less closely corresponding to the old limits of Old and New Castile, so as to be able afterwards to note the peculiarities of what, for want of a better expression, we must call the Castilian dialects.

In some respects Castilian is hardly further removed from classical Latin than is Italian, in others it has approximately reached the same stage as Provençal. As regards the tonic accent and the treatment of the vowels which come after it, Castilian may be said to be essentially a paroxytonic language, though it does not altogether refuse proparoxytonic accentuation and it would be a mistake to regard vocables like *lámpara, lágrima, rápido*, &c, as learned words. In this feature, and in its almost universal conservation of the final vowels *e, i, u* (*o*), Castilian comes very near Italian, while it separates from it and approaches the Gallo-Roman by its modification of the consonants.

Vowels.—Normal Castilian faithfully preserves the vowels ē, ī, ō, ū, the comparatively infrequent instances in which ē and ō are treated like ĕ and ŏ must be attributed to the working of analogy. It diphthongizes ĕ in *ie*, ŏ in *ue*, which may be regarded as a

weakening of *uo* (see *Romania*, iv. 30). Sometimes *ie* and *ue* in the modern language are changed into *i* and *e*: *silla* from sĕlla (Old Cast. *siella*), *víspera* from vĕspera (Old Cast. *viespera*), *castillo* from castĕllum (Old Cast. *castiello*), *frente* from frontem (Old Cast. *fruente*), *fleco* from flŏccus (Old Cast. *flueco*). The words in which ĕ and ŏ have kept their ground are either learned words like *medio*, *merito*, or have been borrowed from dialects which do not suffer diphthongization. In many cases the old language is more rigorous; thus, while modern Castilian has given the preference to *mente*, *como*, *modo*, we find in old texts *miente*, *cuemo*, *muedo*. Lat. au makes *o* in all words of popular origin (*cosa*, *oro*, &c.).

Consonants.—On the liquids *l*, *m*, *n*, *r* there is little to be remarked, except that the last named letter has two pronunciations—one soft (voiced), as in *amor*, *burla*, the other hard (voiceless), as in *rendir*, *tierra* (Old Cast. in this case goes so far as to double the initial consonant: *rrendir*)—and that *n* is often inserted before *s* and *d*: *ensayo*, *mensage*, *rendir* (reddere). *L mouillée* (written *ll*) represents not only the Latin *l*, *ll*, *lj*, but also, at the beginning of words, the combinations *cl*, *gl*, *pl*, *bl*, *fl*: *llama* (flamma), *llave* (clavis), *llorar* (plorare); the tendency of the modern language is, as in Catalan, to reduce *ll* to *y*; thus one readily hears *yeno* (plenum). *N mouillée* (*ñ*) corresponds to the Latin *nn*, *mn*, *nj*, and sometimes to initial *n*: *año* (annum), *daño* (damnum), *ñudo* (nodum). Passing to the dentals, except as an initial, *t* in words that are popularly current and belong to the old stock of the language, can only be derived from Lat. *tt*, *pt*, and sometimes *ct*, as in *meter* (mittere), *catar* (captare), *punto* (punctum); but it is to be observed that the habitual mode of representing *ct* in normal Castilian is by *ch* (pron. *tch*), as in *derecho* (directum), *pecho* (pectus), so that we may take those words in which *t* alone represents *ct* as secondary forms of learned words; thus we have *bendito*, *otubre*, *santo* as secondary forms of the learned words *bendicto*, *octubre*, *sancto*, alongside of the old popular forms *benduho*, *ochubre*, *sancho*. *D* corresponds in Castilian to Latin *t* between vowels, or *t* before *r*: *amado* (amatus), *padre* (patrem). At the present day the *d* of the suffixes *ado*, *ido* is no longer pronounced throughout the whole extent of the domain, and the same holds good also of the final *d*: *salú*, *poné*, for *salud*, *poned* (from salutem, ponite). Sometimes *d* takes the interdental sound of *z* (English *th*), or is changed into *l*, witness the two pronunciations of the name of the capital—*Madriz* and *Madril* (adj. *Madrileño*). The study of the spirants *c*, *ç*, *s*, *g*, *j* is made a very delicate one by the circumstance that the interdental pronunciation of *c*, *z* on the one hand, and the guttural pronunciation of *g*, *j* on the other, are of comparatively recent date, and convey no notion of the value of these letters before the 17th century. It is admitted, not without reason, that the spirants *c*, *z*, which at present represent but one interdental sound (a lisped *s*, or a sound between *s* and Eng. *th* in thing), had down till about the middle of the 16th century the voiceless sound *ts* and the voiced sound *dz* respectively, and that in like manner the palatal spirants *g*, *j*, *x*, before assuming the uniform pronunciation of the guttural spirant (=Germ. *ch* in *Buch*), had previously represented the voiced sound of ž (Fr. *j*) and the voiceless sound of š (Fr. *ch*), which are still found in Portuguese and in the Castilian dialects of the north-west. The substitution of these interdental and guttural sounds for the surd and sonant spirants respectively did certainly not take place simultaneously, but the vacillations of the old orthography, and afterwards the decision of the Spanish Academy, which suppressed *x* (=š, *x* was retained for *cs*) and allows only *c* and *g* before *e* and *i*, *z* and *j* before *a*, *o*, *u*, make it impossible for us to follow, with the help of the written texts, the course of the transformation. *S* now has the voiceless sound even between vowels: *casa* (pronounced *cassa*); final *s* readily falls away, especially before liquids: *todo los* for *todos los*, *vamono* for *vamos nos*. The principal sources of *j* (*g*) are—Lat. *j* and *g* before *e* and *i* (*juego*, jocum, *gente*, gentem), Lat. initial *s* (*jabon*, saponem), Lat. *x* (*cojo*, coxum), *lj*, *cl* (*consejo*, consilium, *ojo*, oc'lum). The sources of *z* (*c*) are Lat. *cc*, *cj*, *tj*, *s* (*cielo*, caelum, *calza*, calcea, *razon*, rationem, *zampoña*, symphonia). As regards the spirants *f* and *v*, it is to be observed that at the beginning of a word *f* has in many instances been replaced by the aspirated *h* (afterwards silent), while in others no less current among the people the transformation has not taken place; thus we have *hijo* (filium) alongside of *fiesta* (festa). In some cases the *f* has been preserved in order to avoid confusion that might arise from identity of sound: the *f* in *fiel* (fidelis) has been kept for the sake of distinction from *hiel* (fel). As for *v*, it has a marked tendency to become confounded, especially as an initial letter, with the sonant explosive *b*, Joseph Scaliger's pun—*bibere est vivere*—is applicable to the Castilians as well as to the Gascons. *H* is now nothing more than a graphic sign, except in Andalusia, where the aspirate sound represented by it comes very near *j*. Words beginning in *hue*, where the *h*, not etymologically derived, marks the inseparable aspiration of the initial diphthong *ue*, are readily pronounced *gue* throughout almost the whole extent of the domain: *guele* for *huele* (olet), *gueso* for *hueso* (os). This *gue* extends also to words beginning with *bue*: *gueno* for *bueno* (bonum).

Inflexion.—There is no trace of declension either in Castilian or in Portuguese. Some nominative forms—*Dios* (anciently *Dios*, and in the Castilian of the Jews *Dio*), *Carlos*, *Marcos*, *sastre* (sartor)—have been adopted instead of forms derived from the accusative, but the vulgar Latin of the Peninsula in no instance presents two forms (subjective and objective case) of the same substantive. The article is derived from ille, as it is almost everywhere throughout the Romance regions: *el*, *la*, and a neuter *lo*; *los*, *las*. The plural of the first and second personal pronoun has in the modern language taken a composite form—*nosotros*, *vosotros*—which has been imitated in Catalan. *Quien*, the interrogative pronoun which has taken the place of the old *qui*, seems to come from quem.

Conjugation.—The conjugation of Castilian (and Portuguese) derives a peculiar interest from the archaic features which it retains. The vulgar Latin of Spain has kept the pluperfect indicative, still in current use as a secondary form of the conditional (*cantara*, *vendiera*, *partiera*), and, what is more remarkable still, as not occurring anywhere else, the future perfect (*cantare*, *vendiere*, *partiere*, formerly *cantaro*, *vendiero*, *partiero*). The Latin future has been replaced, as everywhere, by the periphrasis (cantare habeo), but it is worth noticing that in certain old texts of the 13th century, and in the popular songs of a comparatively ancient date which have been preserved in Asturias, the auxiliary can still precede the infinitive (habeo cantare), as with the Latin writers of the decadence: "Mucho de mayor precio a seer el tu manto Que non será el nuestro" (Berceo, *S. Laur.*, str. 70), where *a seer* (habet sedere) corresponds exactly to *será* (sedere habet). The vulgar Latin of the Peninsula, moreover, has preserved the 2d pers. pl. of the imperative (*cantad*, *vended*, *partid*), which has disappeared from all the other Romance languages. Another special feature of Castilian-Portuguese is the complete absence of the form of conjugation known as inchoative (intercalation, in the present tense, of the syllable *isc* or *esc* between the radical and the inflexion), although in all the other tenses, except the present, Spanish shows a tendency to lay the accent upon the same syllable in all the six persons, which was the object aimed at by the inchoative form. Castilian displaces the accent on the 1st and 2d pers. pl. of the imperfect (*cantábamos*, *cantabais*), of the pluperfect indicative (*cantáramos*, *cantarais*), and of the imperfect subjunctive (*cantásemos*, *cantaseis*); possibly the impulse to this was given by the forms of future perfect *cantáremos*, *cantareis* (*cantáremus*, *cantaritis*). The 2d persons plural were formerly (except in the perfect) *-ades*, *-edes*, *-ides*; it was only in the course of the 16th century that they got reduced, by the falling away of *d*, to *ais*, *eis*, and *is*. The verb essere has been mixed, not as in the other Romance languages with stare, but with sedere, as is proved by older forms *seer*, *seades*, *seeden*, *seyendo*, obviously derived from sedere, and which have in the texts sometimes the meaning of "to be seated," sometimes that of "to be," and sometimes both. In old Latin charters also sedere is frequently met with in the sense of esse: e.g., "*sedeat* istum meum donativum quietum et securum" (anno 1134), where *sedeat*=*sit*. The 2d pers. sing. of the present of *ser* is *eres*, which is best explained as borrowed from the imperfect (*eras*), this tense being often used in Old Spanish with the meaning of the present; alongside of *eres* one finds (but only in old documents or in dialects) *sos*, formed like *sois* (2d pers. pl.) upon *somos*. The accentuation in the inflexion of perfects in the conjugation called strong, like *hubiéron*, *hiciéron*, which correspond to habuĕrunt, fecĕrunt (while in the other Romance languages the Latin type is ĕrunt: Fr. *eurent*, *firent*), may be regarded as truly etymological, or rather as a result of the assimilation of these perfects to the perfects known as weak (*amaron*), for there are dialectic forms having the accent on the radical, such as *dixon*, *hizon*. The past participle of verbs in *er* was formerly *udo* (utus) in most cases; at present *ido* serves for all verbs in *er* and *ir*, except some ten or twelve in which the participle has retained the Latin form accented on the radical: *dicho*, *hecho*, *visto*, &c. It ought to be added that the past participle in normal Castilian derives its theme not from the perfect but from the infinitive: *habido*, *sabido*, from *haber*, *saber*, not from *hubo*, *supo*.

CASTILIAN DIALECTS.—To discover the features by which these are distinguished from normal Castilian we must turn to old charters and to certain modern compositions in which the provincial forms of speech have been reproduced more or less faithfully.

Asturian.—The Asturian idiom, called by the natives *bable*, is differentiated from the Castilian by the following characters. *Ie* occurs, as in Old Castilian, in words formed with the suffix *ellum* (*castiellu*, *portiellu*, while modern Castilian has reduced *ie* to *i*. *E*, *i*, *u*, post-tonic for *a*, *e*, *o*: *penes* (*penas*), *gracies* (*gracias*), *esti* (*este*), *frenti* (*frente*), *llechi* (*leche*), *nuechi* (*noche*), *unu* (*uno*), *primeru* (*primero*). There is no guttural spirant, *j*, but, according to circumstances, *y* or *x* (š); thus Lat. *cl*, *lj* gives *y*: *veyu* (*veclus), *espeyu* (spec'lum), *conseyu* (consilium), and after an *i* this *y* is hardly perceptible, to judge by the forms *fiu* (filium), *escoidos* (Cast. *escogidos*), *Castia* (*Castilla*). Lat. *g* before *e* and *i*, Lat. initial *j*, and Lat. *ss*, *x*, give *x* (š)—*xente* (gentem), *xudiu* (Judaeus), *baxu* (bassus), *coxu* (coxus), *floxu* (fluxus). Lat. initial *f* has kept its ground, at least in part of the province: *fiu*, *fueya* (Cast.

hijo, hoja). A very marked feature is the habitual "mouillure" of *l* and *n* as initial letters: *llecho, llecer, lluna, llutu, ñon, ñuvia, ñueie, ñube*. With respect to inflexion the following forms may be noted:—personal pronouns *i* (*illi*), *yos* (*illos*), possessive pronouns *mio*, pl. *mios*, *to*, *tos*, *so*, *sos* for both masc. and fem.; verbs: 3d pers. pl. imp. of the 2d and 3d conjugations in *in* for *ien* (Cast. *ian*), *tiain*, *tenin*, *facin* (from *facer*), *fin* (from *fer*), and even some instances of the 2d pers. sing. (*ubis*, Cast. *habias*); instances of pres. subj. in *ia* for *a* (*siria, metia, sépia*). The verb *ser* gives *yes* (sometimes *yeres*) in the 2d pers. sing., *ye* in the 3d. Facere appears under two forms—*facer* and *fer*,—and to the abridged form correspond *feis, fiendo, fin*, &c. Ire often appears under the form *dir* (*antes de dir os = antes de ir os*), which it is not necessary to explain by *de ire* (see Schuchardt, *Ztschr. f. rom. Philol.*, v. 312).

Navarrese-Aragonese.—In its treatment of the post tonic vowels this dialect parts company with normal Castilian and comes nearer Catalan, in so far as it drops the final *e*, especially after *nt*, *rt* (*mont, plu ient, muert, fuert, parents, gents*), and, when the atonic *e* has dropped after a *v*, this *v* becomes a vowel—*bieu* (brevem), *grieu* (grevem), *nueu* (novem). Navarrese-Aragonese has the diphthongs *ie*, *ue* from tonic *ĕ* and *ŏ*, and adheres more strictly to them than normal Castilian does,—*cuende* (cŏmitem), *huey* (hŏdie), *pueyo* (pŏdium), *yes* (ĕst), *yeran* (ĕrant), while Castilian says *conde, hoy, poyo, es, eran*. The initial combinations *cl, pl, fl*, have withstood the transformation into *ll* better than in Castilian: *plano, pleno, plega, clamado, flama* are current in old documents, and at the present day, although the *l* has come to be "mouillée," the first consonant has not disappeared (*plluma, plloia, pllano*—pronounced *pljuma*, &c.). Lat. *ct* gives *it*, not *ch* as in Castilian: *nueyt* (noctem), *destruito* (destructum), *proveito* (provectum), *dito* for *dicto* (dictum). *D* between vowels kept its ground longer than in Castilian: documents of the 14th century supply such forms as *vidieron, vido, hudio, proudir, redemir, prodeza, Benedit, vidiendo*, &c., but afterwards *y* came to be substituted for *d* or *dj*: *veyere* (videre), *seyer* (sedere), *seya* (sedeat), *goyo* (gaudium), *enueyo* (inodium). Initial *f* does not change into *h*: *fillo, feito*. Navarrese-Aragonese does not possess the guttural spirant (*j*) of Castilian, which is here rendered according to circumstances either by *g* (Fr. *j*) or by *ll* (*l* mouillée), but never by the Asturian *x*. Certain forms of the conjugation of the verb differ from the Castilian: *dar, estar, haver, saber, poner* readily form their imperfects and imperfect subjunctives like the regular verbs in *ar* and *er*,—*havieron* (Cast. *hubieron*), *estuvion* (Cast. *estubieron*), *sabio* (Cast. *supo*), *dasen* (Cast. *diesen*), *poniese* (Cast. *pusiese*); on the other hand, past participles and gerundives formed from the perfect are to be met with,—*fisiendo* for *faciendo* (perf. *fiso*), *tuviendo* and *tuvido* for *teniendo, tenido* (perf. *tuvo*). In the region bordering on Catalonia the simple perfect has given way before the periphrastic form proper to Catalan: *voy cayer* (I fell), *va fe* (he has done), *vamos ir* (we went), &c.; the imperfects of verbs in *er*, *ir*, moreover, are found in *eba*, *iba* (*comeba, subiba*, for *comia, subia*), and some presents also occur where the Catalan influence makes itself felt: *estigo* (Cat. *estich*), *vaigo* (Cat. *vaig*), *veigo* (Cat. *veig*). Navarrese-Aragonese makes use of the adverb *en* as a pronoun: *no les en daren pas, no'n hi ha*.

Andalusian.—The word "dialect" is still more appropriately applied to Andalusian than either to Asturian or Navarrese-Aragonese. Many peculiarities of pronunciation, however, are commonly called Andalusian which are far from being confined to Andalusia proper, but are met with in the vulgar speech of many parts of the Castilian domain, both in Europe and in America. Of these but a few occur only there, or at least have not yet been observed elsewhere than in that great province of southern Spain. They are the following: *L, n, r, d* between vowels or at the end of a word disappear: *sa* (*sal*), *so* (*sol*), *viee* (*viene*), *tiee* (*tiene*), *paa* and *pa* (*para*), *mia* (*mira*), *naa* and *na* (*nada*), *too* and *to* (*todo*). *D* is dropped even from the beginning of a word: *e* (*de*), *inero* (*dinero*), *on* (*don*). Before an explosive, *l, r, d* are often represented by *i*: *saiga* (*salga*), *vaiga* (*valga*), *laigo* (*largo*), *maire* (*madre*), *paire* (*padre*). Lat. *f* is more rigorously represented by *h* than in normal Castilian, and this *h* here preserves the aspirate sound which it has lost elsewhere; *habla, horma* (*forma*), *hoder*, are pronounced with a very strong aspiration, almost identical with that of *j*. The Andalusians also very readily write these words *jabla, jorma, joder*. This aspirate, expressed by *j*, often has no etymological origin; for example, *Jándalo*, a nickname applied to Andalusians, is simply the word *Andaluz* pronounced with the strong aspiration characteristic of the inhabitants of the province. *C, z* are seldom pronounced like *s*; but a feature more peculiar to the Andalusians is the inverse process, the softened and interdental pronunciation of the *s* (the so-called *ceceo*): *zeñor* (*señor*), &c. Before a consonant and at the end of a word *s* becomes a simple aspiration: *mihmo* (*mismo*), *Dioh* (*Dios*), *do reales* (*dos reales*). In the inflexion of the verb there is nothing special to note, except some instances of 2d pers. sing. of the perfect in *tes* for *te*: *estuvistes, estuvites*, for *estuviste*,—evidently a formation by analogy from the 2d pers. of the other tenses, which all have *s*.

It is with the Andalusian dialect that we can most readily associate the varieties of Castilian which are spoken in South America. Here some of the most characteristic features of the language of the extreme south of Spain are reproduced,—either because the Castilian of America has spontaneously passed through the same phonetic transformations or because the Andalusian element, very strongly represented in colonization, succeeded in transporting its local habits of speech to the New World.

Leonese.—Proceeding on inadequate indications, the existence of a Leonese dialect has been imprudently admitted in some quarters; but the old kingdom of Leon cannot in any way be considered as constituting a linguistic domain with an individuality of its own. The fact that a poem of the 13th century (the *Alexandre*), and certain redactions of the oldest Spanish code, the *Fuero Juzgo*, have a Leonese origin has been made too much of, and has led to a tendency to localize excessively certain features common to the whole western zone where the transition takes place from Castilian to Galician Portuguese.

III. PORTUGUESE.—Portuguese Galician constitutes the second branch of the Latin of Spain. In it we must distinguish—(1) Portuguese (*Portuguez*, perhaps a contraction from the old *Portugales* = Portugalensis), the language of the kingdom of Portugal and its colonies in Africa, Asia, and America (Brazil); (2) Galician (*Gallego*), or the language of the old kingdom of Galicia (the modern provinces of Pontevedra, La Coruña, Orense, and Lugo) and of a portion of the old kingdom of Leon (the territory of Vierzo in the province of Leon). Portuguese, like Castilian, is a literary language, which for ages has served as the vehicle of the literature of the Portuguese nation constituted in the beginning of the 12th century. Galician, on the other hand, which began early in the Middle Ages a literary life,—for it was employed by Alfonso the Wise in his *cantigas* in honour of the Virgin,—decayed in proportion as the monarchy of Castile and Leon, to which Galicia had been annexed, gathered force and unity in its southward conquest. At the present day Gallego, which is simply Portuguese variously modified and with a development in some respects arrested, is far from having as a dialect the same importance as Catalan, not only because the Spaniards who speak it (1,800,000) number much less than the Catalans (3,500,000), but also because, its literary culture having been early abandoned in favour of Castilian, it inevitably fell into the vegetative condition of a provincial patois. Speaking generally, Portuguese is further removed than Castilian from Latin; its development has gone further, and its actual forms are more worn out than those of the sister language, and hence it has, not without reason, been compared to French, with which it has some very notable analogies. But, on the other hand, Portuguese has remained more exclusively Latin in its vocabulary, and, particularly in its conjugation, it has managed to preserve several features which give it, as compared with Castilian, a highly archaic air. Old Portuguese, and more especially the poetic language of the 13th century, received from the language of the troubadours, in whose poetry the earlier Portuguese poets found much of their inspiration, certain words and certain turns of expression which have left upon it indelible traces.

Vowels.—Lat. *ĕ*, *ŏ* with the accent have not been diphthongized into *ie*, *uo*, *ue*: *pé* (pedem), *dez* (decem), *bom* (bonus), *pode* (potet). On the other hand, Portuguese has a large number of strong diphthongs produced by the attraction of an *i* in hiatus or the resolution of an explosive into *i*: *raiba* (rabia), *feira* (feria), *feito* (factum), *seixo* (saxum), *oito* (octo). A quite peculiar feature of the language occurs in the "nasal vowels," which are formed by the Latin accented vowels followed by *m*, *n*, or *nt*, *nd*: *bẽ* (bene), *grã* (grandem), *bõ* (bonum). These nasal vowels enter into combination with a final atonic vowel: *irmão* (germanus), also *amão* (amant), *sermão* (sermonem), where the *o* is a degenerated representative of the Latin final vowel. In Old Portuguese the nasal vowel or diphthong was not as now marked by the *til* (˜), but was expressed indifferently and without regard to the etymology by *m* or *n*: *bem* (bene), *tan* (tantum), *disserom* (dixerunt), *sermom* (sermonem). The Latin diphthong *au* is rendered in Portuguese by *ou* (*ouro*, aurum, *pouco*, paucum), also pronounced *oi*. With regard to the atonic vowels, there is a tendency to reduce *a* into a

vowel resembling the Fr *e* "muet," to pronounce *o* as *u*, and to drop *e* after a group of consonants (*dent* for *dente*).

Consonants.—Here the most remarkable feature, and that which most distinctly marks the wear and tear through which the language has passed, is the disappearance of the median consonants *l* and *n*: *coroa* (corona), *lua* (luna), *pôr* formerly *poer* (ponere), *conego* (canonicus), *vir* (venire), *dôr*, formerly *door* (dolorem), *paço* (palatium), *saude* (salutem), *pego* (pelagus). Latin *b* passes regularly into *v*: *cavallo* (caballus), *fava* (faba), *arvore* (arborem), but, on the other hand, Latin initial *v* readily tends to become *b*: *bexiga* (vesica), *bodo* (votum). Latin initial *f* never becomes *h*: *fazer* (facere), *filo* (filum). Latin *c* before *e* and *i* is represented either by the hard sibilant *s* or by the soft *z*. Latin *g* between vowels is dropped before *e* and *i*: *ler* for *leer* (legere), *dedo* (digitum), the same is the case with *d*, of course, in similar circumstances: *remir* (redimere), *rir* (ridere). Latin *j* has assumed the sound of the French *j*. The Latin combinations *cl*, *fl*, *pl* at the beginning of words are transformed in two ways in words of popular origin. Either the initial consonant is retained while the *l* is changed into *r*: *cravo* (clavum), *prazer* (placere), *frol* (florem), or the group is changed in *ch* (=Fr *ch*, Catal *x*) through the intermediate sounds *kj*, *fj*, *pj*: *chamar* (clamare), *chao* (planus), *chamma* (flamma). Within the word the same group and other groups also in which the second consonant is an *l* produce *l* mouillée (written *lh*, just as *n* mouillée is written *nh*, as in Provençal): *orelha* (oric'la), *velho* (*veclus), and sometimes *ch*: *facho* (fac'lum), *ancho* (amplum). Lat *ss* or *sc* before *e* and *i* gives *x* (Fr *ch*): *baixo* (bassus), *faxa* (fascia). The group *ct* is reduced to *it*: *leito* (lectum), *peito* (pectus), *noite* (noctem), sometimes to *ut*: *douto* (doctus). Such words as *fructo*, *recto*, *dilecto* are modern derivatives from the learned forms *fructo*, *recto*, *dilecto*. Latin *cs* becomes *is*: *seis* (sex), or *isc*, *x* (=Fr *ich*, *ch*): *seixo* (saxum), *luxo* (luxum), or even *ss*: *disse* (dixi).

Inflexion.—The Portuguese article, now reduced to the vocalic form *o*, *a*, *os*, *as*, was *lo* (exceptionally also *el*, which still survives in the expression *El-Rei*), *la*, *los*, *las* in the old language. Words ending in *l* in the singular lose the *l* in the plural (because it then becomes median, and so is dropped): *sol* (solem), but *soes* (soles), those having *ão* in the sing form the plural either in *ães* or in *ões* according to the etymology: thus *cão* (canem) makes *cães*, but *ração* makes *rações*. As regards the pronoun, mention must be made of the non-etymological forms of the personal *mim* and of the feminine possessive *minha*, where the second *n* has been brought in by the initial nasal. Portuguese conjugation has more that is interesting. In the personal suffixes the forms of the 2d pers pl in *ades*, *edes*, *ides* lost the *d* in the 15th century, and have now become *ais*, *eis*, *is* through the intermediate forms *aes*, *ees*, *eis*. The form in *des* has persisted only in those verbs where it was protected by the consonants *n* or *r* preceding it: *pondes*, *tendes*, *vindes*, *amardes*, and also no doubt in some forms of the present of the imperative, where the theme has been reduced to an extraordinary degree by the disappearance of a consonant and the contraction of vowels: *ides*, *credes*, *ledes*, &c. Portuguese is the only Romance language which possesses a personal or conjugated infinitive: *amar*, *amar-es*, *amar*, *amar-mos*, *amar des*, *amar em*, e g, *antes de sair mos*, "before we go out." Again, Portuguese alone has preserved the pluperfect in its original meaning, so that, for example, *amara* (amaveram) signifies not merely as elsewhere "I would love," but also "I had loved." The future perfect, retained as in Castilian, has lost its vowel of inflexion in the 1st and 3d pers sing and consequently becomes liable to be confounded with the infinitive (*amar*, *render*, *partir*). Portuguese, though less frequently than Castilian, employs *ter* (tenere) as an auxiliary, alongside of *aver*, and it also supplements the use of essere with sedere, which furnished the subj *seja*, the imperative *se*, *sede*, the gerundive *sendo*, the participle *sido*, and some other tenses in the old language. Among the peculiarities of Portuguese conjugation may be mentioned—(1) the assimilation of the 3d pers sing to the 1st in strong perfects (*houve*, *pude*, *quiz*, *fez*), while Castilian has *hube* and *hubo*, (2) the imperfects *punha*, *tinha*, *vinha* (from *por*, *ter*, and *vir*), which are accented on the radical in order to avoid the loss of the *n* (*ponia* would have made *poia*), and which substitute *u* and *i* for *o* and *e* in order to distinguish from the present subjunctive (*ponha*, *tenha*, *venha*).

Galician.—Almost all the phonetic features which distinguish Portuguese from Castilian are possessed by Gallego also. Portuguese and Galician even now are practically one language, and still more was this the case formerly: the identity of the two idioms would become still more obvious if the orthography employed by the Galicians were more strictly phonetic, and if certain transcriptions of sounds borrowed from the grammar of the official language (Castilian) did not veil the true pronunciation of the dialect. It is stated, for example, that Gallego does not possess nasal diphthongs, still it may be conceded once for all that such a word as planus, which in Galician is written sometimes *chau* and sometimes *chan*, cannot be very remote from the Portuguese nasal pronunciation *chao*. One of the most notable differences between normal Portuguese and Galician is the substitution of the surd spirant in place of the sonant spirant for the Lat *j* before all vowels and *g* before *e* and *i*: *xuez* (judicem), Port *juiz*, *xunto* (junctum), Port *junto*, *xente* (gentem), Port *gente*. In conjugation the peculiarities of Gallego are more marked, some find their explanation within the dialect itself, others seem to be due to Castilian influence. The 2d persons plural have still their old form *ades*, *edes*, *ides*, so that in this instance it would seem as if Gallego had been arrested in its progress while Portuguese had gone on progressing, but it is to be observed that with these full forms the grammarians admit contracted forms as well: *ás* (Port *ais*), *es* (Port *eis*), *is* (Port *is*). The 1st pers sing of the perfect of conjugations in *er* and *ir* has come to be complicated by a nasal resonance similar to that which we find in the Portuguese *mim*, we have *rendin*, *partin*, instead of *vendi*, *parti*, and by analogy this form in *in* has extended itself also to the perfect of the conjugation in *ar*, and *falin*, *gardin*, for *falei*, *gardei* are found. The second persons of the same tense take the endings *che*, *ches* in the singular and *chedes* in the plural: *falache* or *falaches* (fabulasti), *falachedes* as well as *falastedes* (fabulastis), *bateche* or *batiche*, pl *batestes* or *batechedes*, &c. *Ti* (tibi) having given *che* in Galician, we see that *falasti* has become *falache* by a phonetic process. The 3d pers sing of strong perfect is not in *e* as in Portuguese (*houve*, *pode*), but in *o* (*houbo*, *pudo*, *soubo*, *coubo*, &c), Castilian influence may be traceable here. If a contemporary grammarian, Saco Arce, is to be trusted, Gallego would form an absolute exception to the law of Spanish accentuation in the imperfect and pluperfect indicative: *falabamos*, *falabades*, *batiamos*, *batiades*, *pidiamos*, *pidiades*, and *falaramos*, *falarades*, *bateramos*, *baterades*, *pidiramos*, *pidirades*. The future perfect indicative and the imperfect subjunctive, on the other hand, would seem to be accented regularly: *falaremos*, *falasemos*. The important question is worth further study in detail.

Bibliography.—On the general subject the only books to be mentioned are the *Grammatik der romanischen Sprachen* and the *Etymologisches Worterbuch* of Diez. 1. CATALAN. On the old language see Manuel Milá y Fontanals, *De los Trovadores en España*, Barcelona, 1861, and several essays by the same author in the *Revue des Langues Romanes*, the *Jahrb f roman u engl Literatur*, vol v, and the *Revista Histórica* of Barcelona, P Meyer in *Romania*, A Mussafia in the introduction to *Die Catalanische metrische Version der sieben weisen Meister*, Vienna, 1876, and Morel Fatio in *Romania*. For modern Catalan, see Ballot y Torres, *Gramatica y Apologia de la Llengua Cathalana*, Barcelona, 1814, A de Bofarull, *Estudios, Sistema Gramatical y Crestomatia de la Lengua Catalana*, Barcelona, 1864, and, before all, Manuel Milá y Fontanals, *Estudios de Lengua Catalana*, Barcelona, 1875. The dialectic varieties of Valencia and the Baleares have not yet been sufficiently investigated. On the Catalan of Alghero (Sardinia) there is a memoir by G Morosi in the *Miscellanea di Filologia dedicata alla Memoria dei Prof Caix e Canello*, Florence, 1885. 2. CASTILIAN. Since Diez's time no general work upon Castilian has been published, with the exception of a treatise on Spanish "doublets" by Mme Carolina Michaelis, *Studien zur romanischen Wortschopfung*, Leipsic, 1876, and a *Spanische Sprachlehre*, by Paul Forster, Berlin, 1880, which leaves much to be desired. On the grammar of Old Castilian the remarkable articles of Cornu in *Romania* must be consulted. Hitherto the dialects have received but little attention. For Asturian there is a *Coleccion de Poesias en Dialecto Asturiano*, published at Oviedo in 1839, and some lexicographical notes ("Apuntes Lexicograficos sobre una Rama del Dialecto Asturiano") by G Laverde, in the *Revista de Asturias* for 1879. Navarreso-Aragonese has been worked at by Jerónimo Borao, *Diccionario de Voces Aragonesas*, 2d ed, Saragossa, 1885, and Andalusian has been very searchingly investigated by H Schuchardt in *Ztschr f rom Philol*, vol v. On American Spanish there is an excellent work by R J Cuervo, *Apuntaciones Criticas sobre el Lenguaje Bogotano*, 4th ed, Chartres, 1885. 3. PORTUGUESE. The researches of Diez have been followed up by F Adolpho Coelho in two works, *Theoria da Conjugação em Latim e Portuguez*, Lisbon, 1871, and *Questões da Lingua Portugueza*, 1st pt, Oporto, 1874. MM Cornu and Coelho have contributed several very important articles in Portuguese to the pages of *Romania*. For Galician Saco Arce's *Gramatica Gallega*, Lugo, 1868, and A Fernandez y Morales's *Ensayos Poéticos en Dialecto Berciano*, with introduction and glossary by Mariano Cubí y Soler, Leon, 1861, ought to be consulted. (A M-F)

PART IV.—LITERATURE

The name Spanish is now generally restricted to the literature of the Castilian tongue. In the present article it is taken in the wider sense as embracing the literature of the whole Iberian Peninsula, with the exceptions of PORTUGAL (*q v*) and of Galicia, the latter of which as regards language and literature belongs to the Portuguese domain. Spanish literature thus considered falls into two divisions—Castilian and Catalan.

I. CASTILIAN LITERATURE.—Of the Castilian texts now extant none are of earlier date than the 12th century, and very probably none go farther back than 1150. That accepted as the oldest—the *Mystery of the Magian Kings*, as it is rather inappropriately designated—is a fragment of a short semi-liturgical play meant to be acted in the church of Toledo at the feast of Epiphany. Manifestly an imitation of the Latin *ludi* represented in France in the 12th

century, the Spanish piece cannot have been composed much before 1150

Heroic poetry

The great national hero Rodrigo Diaz de Bivar (died 1099), better known in history by the Arabic surname of the CID (*q v*), was celebrated in the vulgar tongue less than a century after his death in two poems, neither of which, however, has come down to us in its entirety The first *cantar*, usually entitled *Poema del Cid* since the first edition by Tomas Antonio Sanchez, relates in its first part the valiant deeds (*la gesta*) of the Cid subsequent to his quarrel with King Alfonso VI, in the second the capture of Valencia, the reconciliation of the hero with the king, and the marriage of his daughters with the "infantes" of Carrion,[1] and then in the third the treason of the infantes, the vengeance of the Cid, and the second marriage of his daughters with the infantes of Navarre and Aragon The narrative of the last years of the Cid, which closes this third part, is very much curtailed Whilst in the *Poema* the Cid appears as the loyal vassal, faithful to his king and deploring the necessity of separating from him, the Cid of the second poem, *Crónica rimada del Cid*, is almost a rebel and at least a refractory vassal who dares treat his sovereign as an equal The portion of the *Crónica* which has been preserved deals in the main with the youth (*mocedades*) of Rodrigo, it contains the primitive version of his quarrel with the Count Gomez de Gormaz, and the marriage of the slayer of the count with Ximena, his daughter, and also a series of fabulous episodes, such as the Cid's journey to France to fight with the twelve peers of Charlemagne, &c If the *Poema* really belongs to the 12th century, some doubt attaches to the date of the *Crónica*, it would seem that the form under which this latter text has reached us is more recent than that of the *Poema*, but, on the other hand, several traditions collected by the author bear an incontestable stamp of antiquity The versification of both poems is very barbarous, the metre very irregular Normally this great epic measure ought to be divided into two hemistichs of seven or eight syllables each, but here the lines sometimes fall short of this number and sometimes exceed it Instead of rhyme, assonance steadily prevails throughout, the strophes follow the model of the *laisses* of the French *chansons de geste*,—that is, they have a single assonance and vary greatly in extent

The other heroes of Spanish history, such as the last Gothic king Roderick, Bernardo del Carpio, the infantes of Lara, have not given rise to long poems, at least we are acquainted with none of which they are the subject Still some may have existed, and in fact the frequent allusions in the chronicle of Alfonso the Wise (13th century) to the narratives of the *juglares* suggest that Castilian heroic poetry was richer than the scarcity of the monuments still extant would lead us to believe Fernan Gonzalez, first independent count of Castile (10th century), has alone been celebrated in a poem of the 13th century, composed in single-rhyme quatrains

Poems of 13th century

With the heroic poetry which takes its themes from the national history and legends, there grew up in the 13th century a religious and didactic poetry, the most eminent representative of which is Gonzalo de Berceo (1198–1268) This poet, born at Berceo in the province of Logroño, composed several lives of Spanish saints (St Domingo de Silos, St Millan de la Cogulla, St Oria), and also devotional poems, such as the *Miracles* and the *Praises of the Virgin*, and some religious hymns Berceo names his poems *prosa*, *decir*, *dictado*, indicating thereby that he intended them to be read and recited, not sung like the *cantares* They are written in single-rhyme quatrains and in verses of twelve to fourteen syllables, according as the ending of each hemistich is masculine or feminine In the same kind of versification were composed, also in the 13th century, two long poems,—one on Alexander the Great, the other on Apollonius of Tyre,—after Latin and French sources The author of the first of these poems contrasts his system of versification, which he calls *mester de clerecia*, with the *mester de joglaria*, the one of the heroic poetry, intended to be sung, and declares that this single-rhyme quatrain (*curso rimado por la quaderna via*) consists of counted syllables The composer of *Appolonio* calls this same versification *nueva maestria* The single rhyme quatrain, introduced in imitation of the French poetry of the 12th century into Castilian literature, became from the time of Berceo and the *Alexandro* and *Appolonio* the regular form in Castilian narrative and didactic poetry, and prevailed down to the close of the 14th century

To the 13th century seem also to belong a *Life of St Mary the Egyptian*, translated from the French, perhaps through a Provençal version, and an *Adoration of the Three Kings*, in verses of eight or nine syllables rhyming in pairs (*aa*, *bb*, *cc*, &c), as well as a fragment of a *Debate between Soul and Body*, in verses of six or seven syllables, evidently an imitation of one of those mediæval Latin poems entitled *Rixa Animi et Corporis* Mention may here also be made of the *cantigas* ("songs") of Alfonso the Wise in honour of the Virgin, although, being in the Galician dialect, these properly belong to the history of Portuguese literature

Poetry of 14th century.

The 14th century saw the birth of the most original mediæval Spanish poet Juan Ruiz (1300–1350), archpriest of Hita (near Guadalajara), has left us a poem of rather irregular composition, in which, while reproducing apologues translated from the Latin or French fabulists, and extracts from Ovid's *Art of Love*, or from a poem entitled *Pamphilus de Amore*, or, lastly, from *fabliaux* and *dits*, such as the *Bataille de Karesme et de Charnage*, the author frequently gives way to his own inspiration Ruiz celebrates love and woman, his book is of *buen amor*, that is, he shows by his own experience and the example of the authors whom he follows how a man ought to set to work to be a successful lover The character of the female go-between, named "Trota-Conventos," here plays an important part, it was suggested to Ruiz by the *Pamphilus*, but he has greatly strengthened the characteristics and thus prepared the way for the Celestina of the close of the 15th century By way of precaution, the author represents himself as one who has survived his illusions, and maintains that carnal love (*loco amor*) must in the long run give place to divine love, but this stratum of devotion is a thin one and ought not to disguise the real character of the work His form of versification is the single-rhyme quatrain in the narrative portions, as to the "songs" (*cantigas*) which sometimes interrupt the narrative, and of which the most successful are a "song of scholars" and a "song of the blind," their rhythm is different and much more varied The *Rimado de Palacio* of the grand chancellor of Castile, Pedro Lopez de Ayala (1332–1407), does not exclusively refer to court life, the author takes up all classes of laymen and churchmen, whose vices he depicts in jocular style Amid the tirades of this long moral poem there occur occasionally some *cantares* or even *decires* in strophes of eight lines of twelve syllables Akin to this *Rimado de Palacio* are the *Proverbios Morales* of the Jew Santob (Shemtob) of Carrion, dedicated to King Pedro the Cruel, who reigned from 1350 to 1369, as well as the *General Dance of Death* and a new version of the *Debate between Soul and Body*, both in eight-line strophes of *arte mayor* (verses of twelve syllables), and both imitations of

[1] Carrion de los Condes is a district in the province of Valencia

French originals. The 14th century also produced a long historical composition in verse, the *Rhymed Chronicle of Alfonso XI.* (died 1350), by Rodrigo Yanez, important fragments of which have come down to us; the versification of this chronicle is similar to that of Santob's *Proverbs* (strophes of four octosyllabic verses rhyming *abab*).

Romances.

The word romance not only signifies in Spain, as in other Romanic countries, the vulgar tongue, but also bears the special meaning of a short epic narrative poem (historic ballad) or, at a later date, a short lyric poem. As regards the form, the "romance" (Spanish *el romance*, in contrast to French, &c., *la romance*) is a composition in long verses of fourteen syllables ending with one rhyme, or assonance, which have been generally, but wrongly, divided into two short lines, the first of which, naturally, is rhymeless. This being the form of the romance verse, the *Crónica rimada del Cid*, and even the *Poema* (though in this case the influence of the French alexandrines is perceptible), might be considered as a series of romances tagged on one after the other; and in fact several of the old romances of the Cid, which form each an independent whole and have been printed as separate poems in the 16th century, are partly to be found in the *Crónica*. Other romances, notably those dealing with the heroes of the Carlovingian epic, so popular in Spain, or with the heroes which Spanish patriotism opposed at a certain period to the French paladins,—as, for example, Bernardo del Carpio, the rival and the conqueror of Roland in Castilian tradition,—seem to be portions severed from those *cantares de gesta* composed by *juglares* of which Alfonso X. makes mention. It is only at the close of the 15th century, and especially during the 16th, that the romances, which had previously passed from mouth to mouth by song and recitation, began to be written down and afterwards to be printed, at first on broadsheets (*pliegos sueltos*) and subsequently in collections (*romanceros*), either general, in which romances of very different date, character, and subject are mixed up, or restricted to a single historical or legendary episode or to a single personage (for example, the *Romancero del Cid*). In those collections the epic verse is always regarded as octosyllabic and printed as such; occasionally certain editions divide the romance into strophes of four verses (*cuartetas*).

Prose chronicles, 13th–16th centuries.

King Alfonso X. (died 1284), under whose patronage were published the memorable code entitled *Las Siete Partidas* and great scientific compilations, such as the *Libros de Astronomia* and the *Lapidario*, was also the founder of Spanish historiography in the vulgar tongue. The *Crónica General*, composed under his direction, consists of two distinct parts: the one treats of universal history from the creation of the world to the first centuries of the Christian era (*La General é Grant Historia*), the other exclusively of the national history (*La Crónica ó Historia de España*) down to the death of Ferdinand III. (1252), father of Alfonso. The main sources of the *Crónica General* are two Spanish chroniclers of the 13th century,—Lucas of Tuy and Rodriguez of Toledo,—who wrote in Latin, but whose works were early translated into the vernacular. In the *Historia de España* of Alfonso X., which has collected many legends and which occasionally refers to the songs of the *juglares* (for the purpose, however, of refuting them), the narrative relating to the Cid is partly based on an Arabic text. This portion has frequently been printed by itself, under the title of *Crónica del Cid*. Alfonso's example bore fruit. In the 14th century we find another *Crónica General de España* or *de Castilla*, constructed on the model of the first and embracing the years 1030–1312; next, the *Grant Crónica de España* and the *Grant Crónica de los Conquiridores*, compiled by command of the grandmaster of the order of St John of Jerusalem, Juan Fernandez de Heredia, about 1390. Special chronicles of each king of Castile were soon written. Our information is at fault in regard to the authorship of the chronicles of Alfonso X., Sancho IV., Ferdinand IV., and Alfonso XI.; but the four following reigns—those of Pedro I., Henry II., John I., and Henry III.—were dealt with by Pedro Lopez de Ayala, and here we can recognize the man of literary culture, who had acquired some knowledge of ancient history, for the form of the narrative becomes freer and more personal and the style rises with the thought. Several authors had a hand in the chronicle of John II., but the final redaction was by Fernan Perez de Guzman. The sad reign of Henry IV. was related by Diego Enriquez del Castillo and Alfonso de Palencia, the glorious reign of the Catholic sovereigns Ferdinand and Isabella by Fernando del Pulgar and Andrès Bernaldes.

Biographies.

Along with those royal chronicles must be mentioned some biographies of important persons. Thus in the 15th century the chronicle of Pedro Niño, count of Buelna (1379–1452), by Gutierre Diez de Gamez, that of Alvaro de Luna, constable of Castile (died 1453), also a very curious book of travels, the narrative of the embassy sent by Henry III. of Castile to Timur in 1403, written by the head of the mission, Ruy Gonzalez de CLAVIJO (*q.v.*).

Other prose works of 13th and 14th centuries.

The other productions of Castilian prose in the 13th and 14th centuries are for the most part didactic and sententious compositions, which, however, contain illustrations or tales of Eastern origin. The Spanish translation of *Kalila and Dimna*, made direct from an Arabic text, dates from the middle of the 13th century, and the romance of the *Seven Sages* (*Sindibad*), published under the title of *Engaños é Assayamientos de las Mugeres*, must be referred to almost the same period. From the second half of the 13th century the collections of sentences, *dits*, apologues, and moral tales become very numerous: first of all, versions of the *Secretum Secretorum*, attributed in the Middle Ages to Aristotle, one of which is entitled *Poridat de las Poridades*, next the *Proverbios Buenos*, the *Bocados de Oro* or *Libro de Bonium, Rey de Persia*, the *Libro de los Gatos*, which is derived from the *Narrationes* of Eudes of Cheriton. But the most celebrated is the *Libro de los Castigos y Documentos* of King Sancho IV. (died 1295), who also composed a *Lucidario*, a kind of encyclopædia of theology, morals, and natural history. It was during the first half of the 14th century that the nephew of Alfonso X., the infant Juan Manuel (1282–1349), wrote those various works which place him in the first rank of mediæval Spanish prose writers. The best known is the collection of tales, many of them borrowed from Oriental sources, entitled *El Conde Lucanor*; but besides this contribution to light literature he wrote graver and more specially instructive works, notably the *Libro de los Estados* or *Libro del Infante*, a kind of manual of education, domestic economy, and politics; the *Libro del Caballero é del Escudero*, a practical treatise on chivalry somewhat resembling a work of Raymond Lully on the same subject. Unfortunately Juan Manuel's poems, which he had collected in a *Libro de las Cantigas* or *de los Cantares*, have been lost. The knowledge of antiquity, previously so poor and vague, made remarkable progress in the 14th century. It was thought desirable to learn more about certain episodes of ancient history, such as the War of Troy, and therefore the poem on that subject by the Frenchman Benoît de Sainte-More and the Latin narrative of Guido de Columna were both translated. Pedro Lopez de Ayala translated or caused to be translated Pierre Bersuire's French version of Livy, Boethius, and various writings of Isidore of Seville and Boccaccio.

Books of chivalry.

While the Carlovingian cycle is mainly represented in Spain by romances, of which the oldest seem to be frag-

ments of lost poems of the *juglares*, the British cycle (Lancelot, Tristram, Merlin, &c) is represented almost exclusively by works in prose (compare ROMANCE) Those narratives are known, it is true, only by 15th and 16th century editions in which they have been more or less modified to suit the taste of the time, but it is impossible not to recognize that books such as *El Baladro del Sabio Merlin* and *La Demanda del Sancto Grial* (1515) presuppose a considerable antecedent literature of which they are only the afterglow The principal French romances of the Round Table were translated and imitated in Spain and in Portugal as early as the first half of the 14th century at least, of that there is no doubt And, even if there was not on this point satisfactory testimony, the prodigious development in Spanish literature of the *caballerias* or "book of chivalry," incontrovertibly derived from fictions of British origin, is proof enough that the Spaniards have at an early date been familiarized with this romance from France The first book which begins the series of strictly Spanish *caballerias* is the *Amadis de Gaula* (i e, of Wales, not France) We know the *Amadis* only by the version made about 1480 in four books by Garci Ordoñez de Montalvo (the oldest edition extant is dated 1508), but the work in its original form (three books), already widely distributed and celebrated by various Castilian poets from about 1350, must have been composed at the latest in the second third of the 14th century A few rather vague hints and certain sentimental considerations lead one to seek for the unknown author of the first *Amadis* in Portugal, where the romances of the Round Table were even more highly appreciated than in Spain, and where they have exercised a deeper influence on the national literature To Montalvo, however, falls the honour of having preserved the book by republishing it, he only made the mistake of diluting the original text too much and of adding a poor continuation, *Las Sergas de Esplandian* Allied to Montalvo's *Amadis* with its Esplandian appendage are the *Don Florisando* and the *Lisuarte de Grecia*, the *Amadis de Grecia*, the *Don Florisel de Niquea*, &c, which form what Cervantes called the "Amadis sect" Along with the Amadises range the Palmerines, the most celebrated of which are the *Palmerin de Oliva*, the *Primaleon*, and the *Palmerin de Inglaterra* None of those *caballerias* inspired by the *Amadis* were printed or even written before the 16th century, and they bear in language and style the stamp of that period, but they cannot be separated from their mediæval model, the spirit of which they have preserved intact Among the *caballerias* we may also class some narratives belonging to the Carlovingian epic,—the *Historia del Emperador Carlomagno y de los Doce Pares*, a very popular version still reprinted of the French romance of *Fierabras*, the *Espejo de Caballerias*, into which has passed a large part of the *Orlando Innamorato* of Boiardo, the *Historia de la Reina Sibilla*, &c

Poetry of 15th century

The first half of the 15th century, or, what comes almost to the same thing, the reign of John II of Castile (1407–1454), is as regards its literature characterized by three facts —(1) by the development of a court poetry, artificial and pretentious, (2) by the influence of Italian literature on Castilian prose and poetry, the imitation of Boccaccio and Dante, especially of the latter, which introduced into Spain a liking for allegory, and (3) by more assiduous intercourse with antiquity—a fuller understanding of the Latin writers who had been brought to the front by the Italian renaissance After the example of the Provençals, whose literary doctrines had made their way into Castile through Portugal and Catalonia, poetry is now styled the *arte de trobar* The *arte de trobar* is strictly "court" poetry, which consists in short pieces of rather complicated versification,—love plaints, debates, questions, and repartees, *motes* with their *glosas*, burlesque and satirical songs,—a poetry wholly "occasional," and which when separated from its natural environment loses great part of its charm In order to understand and appreciate those pieces they must be read in the collections made by the poets of the time, and the one must be brought to throw light on the other The most celebrated *cancionero* of the 15th century is that compiled for the amusement of his sovereign by Alfonso de Baena (who has not designated himself a Jew, as has been supposed, the word *judino* attached to his name in the preface being nothing but *indino*), it is, so to say, the official collection of the poetic court of John II, although it also contains some pieces by poets of earlier date After Baena's collection may be mentioned the *Cancionero de Stuñiga*, which contains the Castilian poems of the trobadores who followed Alfonso V of Aragon to Naples Those *cancioneros*, consisting of the productions of a society, a group, were succeeded by collections of a more general character in which versifiers of very different periods and localities are jumbled together, the pieces being classed simply according to their type The earliest *Cancionero General* is that compiled by Juan Fernandez de Constantina, which appears to have issued from the Valencia press in the very beginning of the 16th century, the second, much better known, was published for the first time at Valencia in 1511, its editor was called Fernando del Castillo The other poetic school of the 15th century, which claims to be specially related to the Italians, had as its leaders Juan de Mena (1411–1456), author of the *Coronacion* and the *Laberinto* or *Las Trecientas* (a long poem so called because of the number of stanzas which, according to the scheme, were to compose it), and the marquis of Santillana, D Iñigo Lopez de Mendoza (1398–1458), who in his sonnets was the first to imitate the structure of the Italian *endecasillabo* Along with those two, who may be designated *poetas*, in distinction from the *decidores* and the *trobadores* of the *cancioneros*, must be ranked Francisco Imperial, a Genoese by descent, who also helped to acclimatize in Spain the forms of Italian poetry The marquis of Santillana occupies a considerable place in the literature of the 15th century, not only by reason of his poems, but quite as much if not more through the support he afforded to all the writers of his time, and the impulse he gave to the study of antiquity and to the labours of translators who at his request turned Virgil, Ovid, Seneca, &c, into Castilian He himself was not acquainted with Latin, but the generous efforts he made to stir up his fellow-countrymen to learn it have justly procured him the title of father of Spanish humanism That he had an extensive knowledge of the national literature and of the literatures of France and Italy he has shown in the preface to his works, which is a sort of *ars poetica* as well as an historical exposition of the kinds of poetry cultivated in the Middle Ages by the Spaniards and the neighbouring nations

Prose of 15th century

With the exception of the chronicles and some *caballerias*, the prose of the 15th century contains nothing very striking The translation of Virgil by Enrique de Villena (died 1434) is very clumsy and shows no advance on the versions of Latin authors made in the previous century, better worth reading is the *Trabajos de Hercules*, a whimsical production but with some savour in its style A curious and amusing book, full of details about Spanish manners, is the *Corbacho* of the archpriest of Talavera, Alonso Martinez de Toledo, chaplain to King John II, the *Corbacho* belongs to the numerous family of satires against women, and its title ("The Lash" or "Whip") borrowed from a work of Boccaccio's, with which it has otherwise nothing akin, correctly indicates that he has not spared them

Dramatic literature

The ancient liturgical Spanish theatre is known to us only by fragments of the play of the *Magian Kings*, of which mention has already been made, but certain regulations of the code of the *Siete Partidas* (compiled between 1252 and 1257) prove that this theatre existed, and that at the great festivals, such as Christmas, Epiphany, and Easter, dramatic representations were given in church. These representations, originally a mere commentary on the liturgy, grew more complicated in course of time, they were gradually adulterated with buffoonery, which frequently brought down the censure of the clergy. Alfonso the Wise even thought it necessary formally to forbid the "clerks" playing *juegos de escarnios*, and permitted in the sanctuary only dramas destined to commemorate the principal episodes of the life of Christ. Of all the church festivals, the most popular in Spain was that of Corpus Christi, instituted by Urban IV in 1264. At an early date was introduced the custom of accompanying the celebration of this festival with dramatic representations intended to explain to the faithful the Eucharistic mystery. Those dramas, called *autos sacramentales*, acquired more and more importance, in the 17th century, with Calderon, they become grand allegorical pieces, regular theological dissertations in the form of dramas. To the *auto sacramental* corresponds the *auto al nacimiento*, or drama of the Nativity. The secular theatre is in Spain as elsewhere a product of the religious theatre. Expelled from the church, the *juegos de escarnios* took possession of the public squares and there obtained a free development, they cease to be a mere travesty of dogma to become a separate type, a drama whose movement is no longer determined by the liturgy, and whose actors are borrowed from real life in Spanish society. This new theatre starts about the close of the 15th century with the little pastoral pieces of Juan del Encina (died 1534), which, after Virgil's example, he calls *eglogas*. Genuine shepherds, clumsy, rude, and long-haired (*melenudos*), are the interlocutors of those bucolics, into which are also sometimes introduced students, and even, by Lucas Fernandez, a contemporary and pupil of Encina's, gentlemen (*caballeros*) and soldiers. A book which, strictly speaking, does not belong to the theatre, the *Tragicomedia de Calixto y Melibea*, by Fernando de Rojas, much better known as *La Celestina*, and dating from about 1492, caused the new theatre, still so childish in the attempts of the school of Encina, to make a gigantic step onwards. The history of two lovers, who are brought together by a go-between (Celestina), and who after various vicissitudes ultimately commit suicide,—this astonishing novel taught the Spaniards the art of dialogue, and for the first time exhibited persons of all classes of society (particularly the lowest) speaking in harmony with their natural surroundings, thinking and acting in accordance with their condition of life. The progress caused by the *Celestina* may be estimated by means of the *Propaladia* of Bartolomé Torres Naharro (Naples, 1517), a collection of pieces represented at Rome in presence of Leo X and distributed by their author into two groups—*comedias a noticia*, those treating of things really known and seen, and *comedias a fantasia*, those bringing fictions on the stage, though it may be with the appearance of reality. The most interesting, if not the best composed, are the *comedia soldadesca*, depicting to the life the Spanish man-at arms of the time, and the *comedia tinelaria*, a picture of the manners of the menials of the pontifical court. Torres Naharro is the first Spaniard who borrowed from France the division of the play into "days" (*jornadas*), shortly after Naharro we find the comedy of manners in Lope de Rueda, goldbeater of Seville (died about 1566), whose dramatic work is composed of regular comedies constructed on the model of Naharro and Italian authors of the beginning of the 16th century, and also of little pieces intended for performance in the intervals between the larger plays (*entremeses* and *pasos*), some of which, such as *El Convidado*, *El Rufian Cobarde*, *Las Aceitunas*, are storehouses of sprightliness and wit. Some of Naharro's and especially of Rueda's pieces have already the character of the comedy of intrigue, which is emphatically the type of the classic stage. But to reach Lope de Vega the Spanish stage had to be enlarged in relation to national history. A poet of Seville, Juan de la Cueva (born about 1550), first brought on the boards subjects such as the exploits of the Cid, Bernardo del Carpio, and others, which had previously been treated of only in the "romances". To a poet called Berrio, of whose work nothing has been preserved, are attributed the *comedias* of Moors and Christians, in which were represented famous episodes of the age-long struggle against the infidel. And it is at this period that Cervantes (1585) experimented in the dramatic line, in his *Tratos de Argel* he gives us a picture of galley-life, painful recollections of his long captivity in Algiers. There is no need to linger over certain attempts at tragedy of the ancient type by Geronimo Bermudez (born 1530), Cristóbal de Virues (born about 1550), Lupercio Leonardo Argensola (1562–1613), &c, the only successful specimen of which is the *Numancia* of Cervantes, these works in fact, cold and manneristic, mere exercises in style and versification, remained without influence on the development of the Spanish stage. The pre-classic period of this stage is, as regards dramatic form, one of indecision. Some write in prose, like Rueda, others, like Naharro, show a preference for the *redondillas* of popular poetry, and there are those again who, to elevate the style of the stage, versify in hendecasyllabics. Hesitation is also evident as to the mode of dividing the drama. At first a division into five acts, after the manner of the ancients, is adopted, and this is still followed by Cervantes in his first pieces, then Juan de la Cueva reduced the five acts to four, and in this he is imitated by most of the poets to the close of the 16th century (Lope de Vega himself in his youth composed pieces in four acts). It was only at this time that the custom which is still maintained of dividing all dramatic works into three acts or days was introduced,—exception of course being made of short pieces like the *loa* (prologue), the *entremes*, the *paso*, the *baile* (different kinds of *entr'acte*).

Classic age—16th and 17th centuries

The golden age of Spanish literature, as it is called, belongs to the 16th and the 17th centuries, extending approximately from 1550 to 1650. Previous to the reign of the Catholic sovereigns there exists, strictly speaking, only a Castilian literature, not very self-reliant and largely influenced by imitation first of France and then of Italy, the union of the two crowns of Aragon and Castile, and afterwards the advent of the house of Austria and the king of Spain's election as emperor, proved the creation at once of the political unity of Spain and of Spanish literature. After the death of Philip IV (1665) this fair-shining light went out, the nation, exhausted by distant expeditions, the colonization of America, Continental wars, and bad administration, produced nothing, its literary genius sank in the general decline, and Spain is destined ere long to be subjected again to the influence of France, to which she had submitted during all the first period of the Middle Ages. In the 16th and 17th centuries the literature is eminently national. Of course all is not equally original, and in certain kinds of literature the Spaniards continue to seek models abroad.

Lyric poetry

Lyric poetry, especially that of the highest order, is always inspired by the Italian masters. An irresistible

tendency leads the Spanish poets to rhyme in hendecasyllabics—as the marquis of Santillana had formerly done, though his attempts had fallen into oblivion—and to group their verses in tercets, octaves, sonnets, and *canciones* (*canzoni*). Garcilaso de la Vega (1503–1536), Juan Boscan (1493–*c.* 1550), and Diego de Mendoza (1503–1575) are the recognized chiefs of the school *al italico modo*, and to them belongs the honour of having successfully transplanted to Spain those different forms of verse, and of having enriched and improved the poetic language of their country. The few uncouthnesses of which Mendoza and Boscan more especially are guilty (such as certain faults of rhythmic accentuation) were corrected by their disciples Gutierre de Cetina, Gregorio Silvestre, Hernando de Acuña, by the poets of the so-called school of Seville, headed by Fernando de Herrera (died 1597), and also by those of the rival school of Salamanca, rendered famous mainly by the inspired poetry of Fr. Luis de Leon (1528–1591). Against those innovators the poets faithful to the old Castilian manner, the rhymers of *redondillas* and romances, hold their own; under the direction of Cristóbal de Castillejo (1556) they carry on a fierce war of the pen against the "Petrarchists." But by the last third of the 16th century the triumph of the new Italian school is assured, and no one any longer thinks of reproaching it for its foreign flavour. Only a sort of schism is effected from that period between the higher poetry and the other varieties: the former employs only the hendecasyllabic and the heptasyllabic (*quebrado*), while the popular poets, or those who affect a more familiar tone, preserve the national metres. Almost all the poets, however, of the 16th and 17th centuries have tried their powers in both kinds of versification, using them in turn according to the nature of their subjects. Thus Lope de Vega, first of all, who wrote *La Jerusalem Conquistada* (1609), *La Dragontea* (1602), *La Hermosura de Angélica* (1602), in Italian verses and in octaves, composed his long narrative poem on Isidore, the husbandman patron of Madrid (1599), in quintils of octosyllabic verse, not to mention a great number of "romances." As regards this last form, previously disdained or almost so by artistic poets, Lope de Vega gave it a prestige that brought it into favour with the literates of the court. A host of poets were pleased to recast the old "romances" or to compose new ones. The 17th century, it may be said, is characterized by a regular surfeit of lyric poetry, to which the establishment of various literary academies in the Italian style contributed not a little. Of this enormous mass of verses of all sorts and sizes very little still keeps afloat: the names of three-fourths of the versifiers must be forgotten, and in addition to those already cited it will be sufficient to mention Luis de Góngora (1561–1626) and Francisco de Quevedo Villegas (1580–1645). Góngora is especially famous as the founder of the "cultist" school, as the introducer into Castilian poetry of a flowery, bombastic, and periphrastic style, characterized by sonorous vocables and artificial arrangements of phrase. The Spaniards have given the name of *culto* to this pompous and manneristic style, with its system of inversions based on Latin syntax. The *Soledades* of Góngora are the monument *par excellence* of Spanish mannerism, which made numerous victims and inflicted on the poetry of the Peninsula irreparable injury. But Góngora, a poet of really great powers, had started better, and as often as he cares to forget about being sonorous and affected, and is contented to rhyme romances, he finds true poetic accents, ingenious ideas, and felicitous expressions. Quevedo, much greater, moreover, in his prose works than in his verse, displays real power only in satire, epigram, and parody. There are in some of his serious pieces the stuff of a Juvenal, and his satiric and burlesque romances, of which several are even written in slang (*germania*), are in their way little masterpieces. Another commonplace of Spanish poetry at this period was epic poetry after the style of Tasso's *Gerusalemme*. None of those interminable and prosaic compositions in *octavas reales* come near their model; none of them could even be compared in style, elevation of thought, and beauty of imagery to the *Lusiadas*. They are in reality only rhymed chronicles, and consequently, when the author happens to have taken part in the events he narrates, they have a genuine historical interest. Such is the case with the *Araucana* of Alonso de Ercilla (1533–1594), of which it may be said that it was written less with a pen than with a pike. In burlesque poetry the Spaniards have been rather more successful: *La Gatomaquia* of Lope de Vega and *La Mosquea* of Villaviciosa (died 1658) are somewhat agreeable pieces of fun.

The departments of imaginative literature in which the genius of the new Spanish nation revealed itself with most vigour and originality are the *novela* and the drama. By *novela* must be understood the novel of manners, called *picaresca* (from *picaro*, a rogue or "picaroon") because of the social status of the heroes of those fictions; and this kind of novel is quite an invention of the Spaniards. Their pastoral romance, on the other hand—the best known examples of which are the *Diana Enamorada* of Jorge de Montemayor (died 1561), continued by Alonso Perez and Gaspar Gil Polo, the *Galatea* of Cervantes, and the *Arcadia* of Lope de Vega, as well as their novel of adventure, started by Cervantes in his *Novelas Ejemplares* (1613), and cultivated after him by a host of writers—is directly derived from Italy. The *Arcadia* of Sannazaro is the source of the *Diana* and of all its imitations, just as the Italian *novellieri* alone are the masters of the Spanish *novelistas* of the 17th century. The picaresque novel starts in the middle of the 16th century with the *Vida de Lazarillo de Tormes, sus Fortunas y Adversidades* (1554), the work of a very bold intellect whose personality unfortunately remains unknown, there being no satisfactory reason for assigning this little book, which is as remarkable for the vigour of its satire as for the sobriety and firmness of its style, to Diego Hurtado de Mendoza. A supplement to the adventures of Lazarillo appeared at Antwerp in 1555; it is probably, however, not the production of the author of the original romance. The impetus was given, and the success of *Lazarillo* was so great that imitators soon appeared. In 1599 Mateo Aleman published, under the title of *Atalaya de la Vida Humana*, the first part of the adventures of another picaroon, Guzman de Alfarache, and, as he was in no hurry to finish this narrative, another writer, jealous of his success, took possession of it and issued in 1603, under the pseudonym of Mateo Luxan, a continuation of the first Guzman. Aleman, not to be thwarted, resumed his pen, and published the second part of his romance in 1605. Quite unlike that of the *Lazarillo*, the style of Mateo Aleman of Seville is eloquent, full, with long and learned periods, sometimes diffuse. Nothing could be more extravagant and more obscure than the history of Justina the beggar woman (*La Picara Justina*) by Francisco Lopez de Ubeda (1605), an assumed name which concealed the person of the Dominican Andrés Perez de Leon. The other picaresque romances are—*Alonso Mozo de muchos Amos*, by Geronimo de Alcalá (two parts, 1624 and 1626); the *Historia y Vida del Gran Tacaño Pablo de Segovia* (1626), in which Quevedo has made his most brilliant display of style and wit; the *Garduña de Sevilla* (1634) of Alonso de Castillo Solorzano; *La Vida y Hechos de Estebanillo Gonzalez* (1646), described as *compuesto por el mesmo*, but an Estéban Gonzalez is unknown in the literary history of the 17th century.

Romances.

By degrees the picaresque romance was combined with the novel of Italian origin and gave rise to a new type,—half novel of manners, half romance of adventure,—of which the characteristic example appears to be the *Relacion de la Vida y Aventuras del Escudero Marcos de Obregon* (1618), by Vicente Espinel, one of the most genial and best written works of the 17th century. To the same class belong almost all the novels of Alonso Gerónimo de Salas Barbadillo, such as *La Ingeniosa Helena*, *Don Diego de Noche*, *El Caballero puntual*, &c., Luiz Velez de Guevara's *Diablo Cojuelo* (1641), the model of Lesage's *Diable Boiteux*, and Francisco Santos's highly popular pictures of life in Madrid, *Dia y Noche de Madrid* (1663), *Periquillo, el de las Gallineras*, &c. On the contrary, the novels of Tirso de Molina (*Los Cigarrales de Toledo*, 1624), Perez de Montalban (*Para Todos*, 1632), Maria de Zayas (*Novelas*, 1637), are more in the manner of the *Novelas Ejemplares* of Cervantes, and consequently of the Italian type. Among the so called historical romances one only deserves to be mentioned,—the *Guerras Civiles de Granada* by Gines Perez de Hita, which deals with the last years of the kingdom of Granada and the insurrection of the Moors of the Alpujarras in the time of Philip II. *Don Quixote*, the masterpiece of Miguel Cervantes de Saavedra (1547–1616), is too great a work to be treated along with others; and, besides, it does not fall strictly within the limits of any of the classes just mentioned. If it has to be defined, it may be described as the social romance of 16th and 17th century Spain. Cervantes undoubtedly owed much to his predecessors, notably to the picaresque romancers, but he considerably enlarged the scope of the type, and, what had as yet been done by no one, supported the framework of the story by a lofty moral idea. His main purpose was, as we are beginning to realize, not to turn into ridicule the books of chivalry, which were already out of fashion by his time, but to show by an example pushed to absurdity the danger of *hidalgism*, of all those deplorable prejudices of pure blood and noble race with which three-fourths of the nation were imbued, and which, by the scorn of all useful labour which they involved, were destined to bring Spain to ruin. The lesson is all the more effective as his *hidalgo*, although ridiculous, was not put beyond the pale of the reader's sympathy, and the author condemns only the exaggeration of the chivalrous spirit, and not true courage and devotion when these virtues have a serious object. The same thing happened to *Don Quixote* which had happened to *Guzman de Alfarache*. After the publication of the first part (1605), Cervantes allowed his pen to lie too long idle; and so it occurred to some one to anticipate him in the glory of completing the story of the heroic deeds of the knight of La Mancha. In 1614 a second part of the adventures of Don Quixote made its appearance—the work of a certain Avellaneda, a pseudonym under which people have sought to recognize the inquisitor Luis de Aliaga. Cervantes was thus roused from inactivity, and the following year gave to the world the true second part, which soon effaced the bad impression produced by Avellaneda's heavy and exaggerated imitation.

Drama of 17th century. The stage in the 17th century in some measure took the place of the romances of the previous age; it is, as it were, the medium of all the memories, all the passions, and all the aspirations of the Spanish people. Its style, being that of the popular poetry, made it accessible to the most illiterate classes, and gave it an immense range of subject. From the books of the Bible, the acts of the martyrs, national traditions, the chronicles of Castile and Aragon, and foreign histories and novels, down to the daily incidents of contemporary Spanish life, the escapades and nightly brawls of students, the gallantries of the Calle Mayor and the Prado of Madrid, balcony escalades, sword thrusts and dagger strokes, duels and murders, fathers befooled, jealous ladies, pilfering and cowardly valets, inquisitive and sprightly waiting-maids, sly and tricky peasants, fresh country girls,—all are turned to dramatic account. The enormous mass of plays with which the literature of this period is inundated may be divided into two great classes—a secular and a religious, the latter again subdivided into (1) the liturgical play, *i.e.*, the *auto* either *sacramental* or *al nacimiento*, and (2) the *comedia divina* and the *comedia de santos*, which have no liturgical element and differ from a secular play only in the fact that the subject is religious, and frequently, as one of the names indicates, derived from the history of a saint. In the secular drama, classification might be carried almost to any extent if the nature of the subject be taken as the criterion. It will be sufficient to distinguish the *comedia* (*i.e.*, any tragic or comic piece in three acts) according to the social types brought on the stage, the equipment of the actors, and the artifices resorted to in the representation. We have (1) the *comedia de capa y espada*, which represents any everyday incident, the actors belonging to the middle class, simple *caballeros*, and consequently wearing the garb of ordinary town life, of which the chief items were the cloak and the sword, and (2) the *comedia de teatro* or *de ruido*, or again *de tramoya* or *de apariencias* (*i.e.*, the theatrical, spectacular, or scenic play), which prefers kings and princes for its *dramatis personæ* and makes a great display of mechanical devices and decorations. Besides the *comedia*, the classic stage has also a series of little pieces subsidiary to the play proper: the *loa* or prologue, the *entremes*, a kind of interlude which afterwards developed into the *saynete*, the *baile*, or ballet accompanied with singing, and the *zarzuela*, a sort of operetta thus named after the royal residence of La Zarzuela, where the kings of Spain had a theatre. As to the dramatic poets of the golden age, even more numerous than the lyric poets and the romancers, it is rather difficult to group them. All are more or less pupils or imitators of the great chief of the new school, Lope Felix de Vega Carpio (1562–1635); everything has ultimately to be brought back to him whom the Spaniards call the "monster of Nature." Among Lope's contemporaries, only a few poets of Valencia (Gaspar de Aguilar, Francisco Tarrega, Guillem de Castro (1569–1631), the author of the *Mocedades del Cid* (from which Corneille derived his inspiration), formed a small school, as it were, less subject to the master than that of Madrid, which was bound to merit the applause of the public by copying as exactly as possible the manner of the great imitator. Lope left his mark on all varieties of the *comedia*, but did not attain to equal excellence in all. He was especially successful in the comedy of intrigue (*enredo*), of the *capa y espada* class, and in dramas whose subjects are derived from national history. His great and most incontestable merit is to have given the Spanish stage a range and scope of which it had not been previously thought capable, and of having taught his contemporaries to find dramatic situations and to carry on a plot. It is true he wrote nothing perfect: his prodigious productiveness and facility allowed him no time to mature anything; he wrote negligently, and, besides, he considered the stage an inferior department, good for the *vulgo*, and consequently did not judge it worthy of the same regard as lyric or narrative poetry borrowed from the Italians. Lope's first pupils exaggerated some of his defects, but, at the same time, each, according to his own taste, widened the scope of the *comedia*. Antonio Mira de Amescua and Luis Velez de Guevara (died 1644) were successful especially in tragic histories and *comedias divinas*. Fr. Gabriel Tellez (1570–

1648), better known under the pseudonym of Tirso de Molina, one of the most flexible, ingenious, and inventive of the dramatists, displayed no less talent in the comedy of contemporary manners than in historical drama *El Burlador de Sevilla* (*Don Juan*), the most celebrated of his plays since the Italians and the French have taken possession of the subject, is reckoned his masterpiece, but he showed himself a much greater poet in *El Vergonzoso en Palacio*, *Don Gil de las Calzas Verdes*, *Marta la Piadosa* Finally Juan Ruiz de Alarcon (died 1639), the most serious and most observant of Spanish dramatic poets, successfully achieved the comedy of character in *La Verdad Sospechosa*, closely followed by Corneille in his *Menteur* The remaining play-writers hardly did anything but increase the number of the *comedias*, they added nothing to the real elements of the drama The second epoch of the classical drama is represented mainly by Pedro Calderon de la Barca (1600–1681), the Spanish dramatist who has obtained most celebrity abroad where his pieces have been studied and admired (perhaps extravagantly) by certain critics who have not feared to rank him with Shakespeare It is Calderon who first made honour, or more correctly the point of honour, an essential motive in the conduct of his personages (*e g*, *El Médico de su Honra*), it is he also who made the *comedia de capa y espada* uniform even to monotony, and gave the comic "part" of the *gracioso* (confidential valet of the *caballero*) a fixity which it never previously possessed There is depth and poetry in Calderon, but vagueness also and much bad taste His most philosophic drama, *La Vida es Sueño*, is a bold and sublime idea, but indistinct and feebly worked out, that his *autos sacramentales* give evidence of extensive theological knowledge is all that can be said in their favour Calderon was imitated, as Lope had been, by exaggerating his manner and perverting his excellencies Two poets only of the second half of the 17th century deserve to be cited along with him—Francisco de Rojas, author of the fine historic play *Del Rey abajo ninguno*, and Agustin Moreto (1618–1662), author of some pleasant comedies Among those who worked in secondary forms mention must be made of Luis Quiñones de Benavente, a skilful writer of *entremeses*, and in fact the greatest master of the form

History

A new manner of writing appears with the revival of learning the purely objective style of the old chroniclers, with their tagging on of one fact after another, without showing the logical connexion or expressing any opinion on men or things, begins to be thought puerile An attempt is now made to treat the history of Spain in the manner of Livy, Sallust, Tacitus, whose methods of narration were directly adopted The 16th century, however, still presents certain chroniclers of the mediæval type, with more erudition, precision, and a beginning of the critical element *La Crónica General de España* by Ambrosio de Morales, the *Compendio Historial* of Estéban de Garibai, the *Historia General de las Indias Occidentales* by Antonio de Herrera, are, as far as the style is concerned, continuations of the last chronicles of Castile Gerónimo de Zurita (1512–1580) is emphatically a scholar, no one in the 16th century knew as he did how to turn to account documents and records for the purpose of completing and correcting the narratives of the ancient chronicles, his *Anales de la Corona de Aragon* is a book of great value, though written in a painful style With Juan de Mariana (1536–1623) history ceases to be a mere compilation of facts or a work of pure erudition, in order to become a work of art and of thought The *Historia de España* by the celebrated Jesuit, at first written in Latin in the interest especially of foreigners, was afterwards rendered by its author into excellent Castilian, as a general survey of its history, well-planned, well written, and well thought out, Spain possesses nothing that can be compared with it, it is eminently a national work, steeped throughout in the prejudices of the race Various works of less extent,—accounts of more or less important episodes in the history of Spain,—may take their place beside Mariana's great monument for example, the *Guerra de Granada* by Diego Hurtado de Mendoza (a history of the revolt of the Moors of the Alpujarras under Philip II), written about 1572, immediately after the events, but not published till about thirty years later, after the author's death, the narrative of the expedition of the Catalans in the Morea in the 14th century by Francisco de Moncada (died 1635), that of the revolt of the same Catalans under the reign of Philip IV by Francisco Manuel de Melo (died 1666), a Portuguese by birth, and that of the conquest of Mexico by Antonio de Solis Each of these writers has been more or less inspired by some Latin author, one preferring Livy, another Sallust, &c These imitations, it must be admitted, have something artificial and stilted, which in the long run proves as fatiguing as the unskilfulness and heaviness of the chroniclers of the Middle Ages On the other hand, the historians of the wars of Flanders, such as Carlos Coloma, Bernardino de Mendoza, Alonso Vazquez, Francisco Verdugo, are less refined, and for that very reason are more vivid and more thoroughly interest us in that struggle of the two races, so foreign to each other and of such different genius As for the accounts of the trans-Atlantic discoveries and conquests, they are of two kinds,—either (1) memoirs of the actors or witnesses of those great dramas, as, *e g*, the *Historia Verdadera de la Conquista de la Nueva España* by Bernal Diaz del Castillo, one of the companions of Cortes, and the *Historia de las Indias* by P Bartolomé de las Casas, the apostle of the Indians, or (2) works by professional writers, such as Francisco Lopez de Gomara,—official historiographers who wrote in Spain on information sent to them from the newly-discovered lands

Letter writers

Letter writers, a rather numerous body in Spanish literature, are nearly related to the historians, in fact, letters written to be read by others than the persons addressed, or in any case revised afterwards, are only another method, a little more familiar, of writing history Fernando del Pulgar appended to his *Claros Varones* a series of letters on the affairs of his time, and at the commencement of the 16th century Antonio de Guevara (died 1545) collected, under the title of *Epistolas Familiares*, his correspondence with his contemporaries, which throws a great light on the early part of the reign of Charles V, although it must be used with caution because of the numerous *refacimentos* it has undergone A celebrated victim of Philip II, Antonio Perez (died 1611), revenged himself on his master by relating in innumerable letters, addressed during his exile to his friends and protectors, all the incidents of his disgrace, and by selling to the ministers of France and England the secrets of the Spanish policy in which he had a hand, some of these letters are little masterpieces of sprightliness and gallantry

Philosophy

Philosophy is rather poorly represented in the 16th and 17th centuries in the literature of the vernacular The greater number of the Spanish thinkers of this epoch, whatever the school to which they belonged,—scholastic, Platonic, Aristotelian, or independent,—wrote in Latin Ascetic and mystical authors alone made use of the vulgar tongue for the readier diffusion of their doctrine among the illiterate, from whose ranks a good number of their disciples were recruited Fr Luis de Granada (died 1588) the great preacher, Juan de la Cruz (1542–1591), Fr. Luis de Leon (1528–1598), Teresa de Jesus (1515–

Mysticism

1582), and Malon de Chaide are the brighter lights of this class of writers Some of their books, like the *Guia de Pecadores* of Fr Luis de Granada, the *Confessions* of St Teresa, Malon de Chaide's *Conversion of the Magdalen*, have obtained a brilliant and lasting success beyond the limits of the Peninsula, and have not been without some influence on the development of mysticism in France The Spanish mystics are not only remarkable for the depth or subtlety of their thoughts and the intensity of the divine love with which they are inspired, many of them are masters of style, some, like Juan de la Cruz, have composed verses which rank with the most delicate in the language A notable fact is that those men who are regarded as illuminati profess the most practical ideas in the matter of morality Nothing is more sensible, nothing less ecstatic, than the manual of domestic economy by Fr Luis de Leon—*La Perfecta Casada* Lay moralists are very numerous in the 16th and 17th centuries Some write long and heavy treatises on the art of governing, the education of princes, the duties of subjects, &c Pedro Fernandez de Navarrete's *Conservacion de Monarquias*, Diego de Saavedra Faxardo's *Idea de un Principe Cristiano*, Quevedo's *La Politica de Dios y Gobierno de Cristo*, give a correct idea of the ability which the Spaniards have displayed in this kind of didactic and preceptorial literature,—ability of no high order, for the Spaniard, when he means to teach and work out a doctrine, loses himself in distinctions and rapidly becomes diffuse, pedantic, and obscure But there is a kind of morality in which he indubitably excels, namely, in social satire, which, under all its forms,—dialogue and dream in the style of Lucian, epistle after the manner of Juvenal, or pamphlet,—has produced several masterpieces and a host of ingenious, caustic, and amusing compositions Juan de Valdes, the most celebrated of the Spanish Protestants, led the way by his *Dialogo de Mercurio y Caron*, where all the great political and religious questions of the first half of the 16th century are discussed and resolved with admirable vigour and freedom The king in the department of social satire, as in those of literary and political satire, is Quevedo Nothing escapes his scrutinizing spirit and pitiless irony All the vices of the society of his time are, in his *Sueños* and many other little pamphlets, remorselessly placed in the pillory and cruelly cut to pieces While this great satirist, in philosophy a disciple of Seneca, imitates his master even in his style of writing, he is none the less one of the most vigorous and original writers of the 17th century The only serious defect in his style is that it is too full, not of figures and epithets, but of thoughts His phrases are of set purpose charged with a double meaning, and we are never sure on reading whether we have taken in all that the author meant to convey *Conceptism* is the name that has been given to this refinement of thought, which was doomed in time to fall into the ambiguous and equivocal, it must not be confounded with the *cultism* of Góngora, the artifice of which lies solely in the choice and arrangement of words This new school, of which Quevedo may be regarded as the founder, had its Boileau in the person of Baltasar Gracian, who in 1642 published his *Agudeza y Arte de Ingenio*, in which all the subtleties of conceptism are very exactly reduced to a code Gracian, who had the gift of sententious moralizing rather than of satire, produced in his *Criticon* animated pictures of the society of his own day, while he also displayed much ingenuity in little collections of political and moral aphorisms which have procured him a great reputation abroad,—*El Heroe, El Politico Fernando el Catolico, Oraculo Manual y Arte de Prudencia*

Moralists

18th century

Spanish thought as well as public spirit and all other forms of national activity began to decline towards the close of the 17th century The advent of the house of Bourbon, and the increasing invasion of French influence in the domain of politics as well as in literature and science, confirmed this decay by rendering abortive the efforts of a few writers who had remained faithful to the pure Spanish tradition In the hands of the second-rate imitators of Calderon the stage sank ever lower and lower, lyric poetry, already compromised by the pomp and galimatias of Góngora, was abandoned to wretched rhymsters, who tried without success to make up by extravagance of style for meanness of thought In a word, everything was suffering from anæmia The first symptoms, not of a revival, but of a certain resumption of intellectual production appear in the department of linguistic study In 1714 there was created, on the model of the French academies, La Real Academia Española, intended to maintain the purity of the language and to correct its abuses This Academy set itself at once to work, and in 1726 was able to commence the publication of its dictionary in six volumes folio, the best title of this association to the gratitude of men of letters The *Gramatica de la Lengua Castellana*, drawn up by the Academy, did not appear till 1771 For the new ideas which were introduced into Spain as the result of more intimate relations with France, and which were in many cases repugnant to a nation for two centuries accustomed to live a self contained life, it was necessary that fully sanctioned patrons should be found D Ignacio de Luzan, well read in the literatures of Italy and France, a disciple of Boileau and the French rhetoricians, yet not without some originality of his own, undertook in his *Poetica* (1737) to expound to his fellow-countrymen the rules of the new school, and, above all, the principle of the famous "unities" accepted by the French stage from Corneille's day onward What Luzan had done for letters, Benito Feyjoo (1676–1764), a Benedictine of good sense and great learning, did for the sciences His *Teatro Critico* (1726–1729) and *Cartas Erúditas y Curiosas* (1742–1760), collections of dissertations in almost every department of human knowledge, introduced the Spaniards to the leading scientific discoveries of foreign countries, and helped to deliver them from many superstitions and absurd prejudices The study of the ancient classics and the department of learned research in the domain of national histories and literatures had an eminent representative in Gregorio Mayans y Siscar (died 1782), who worthily carried on the great traditions of the renaissance, besides publishing good editions of old Spanish authors, he gave to the world in 1757 a *Retórica* which is still worth consulting and a number of learned memoirs What may be called the *littérature d'agrément* did not recover much lost ground, it would seem as if the vein had been exhausted. Something of the old picaresque novel came to life again in the *Historia del Famoso Predicador Fray Gerundio de Campazas* of the Jesuit José Francisco de Isla, a biographical romance which is also and above all—to the detriment, it is true, of the interest of the narrative—a satire on the follies of the preachers of the day, the history of Fray Gerundio is merely a pretext, as it were, for displaying and holding up to ridicule the eloquence of the pulpit at the sorry pass to which it had then been brought by the ignorance and bad taste of the Spanish clergy Isla is known also by his translation of *Gil Blas*, a work which he professed to restore to his native country, trying to make out—unsuccessfully, of course—that Le Sage had no other merit than that of rendering it into French The lyric poetry of this period is very pale and colourless when compared with its dazzling splendour in the preceding century. Nevertheless one or two poets can be named who were possessed of refinement of taste, and whose

Romance.

Poetry

collections of verse, though wanting in genuine inspiration, at least show respect for the language and will always meet with some appreciation At the head of the new school is Juan Menendez Valdés (1754-1817), and with his are associated the names of P Diego Gonzales (1733-1794), José Iglesias de la Casa (1748-1791), known especially by his *letrillas*, Nicasio Alvarez de Cienfuegos (1764-1809), and some others Among the verse writers of the 18th century who produced odes and didactic poetry it is only necessary to mention Leandro Fernandez de Moratin (1760-1828) and Manuel Jose Quintana (1772-1857), but the latter belongs rather to the present century, during the first half of which he published his most important works The poverty of the period in lyric poetry is even exceeded by that of the stage Here no kind of comedy or tragical drama arose to take the place of the ancient *comedia*, whose platitudes and absurdities of thought and expression had ended by disgusting even the least exacting portion of the public The attempt was indeed made to introduce the comedy and the tragedy of France, but the stiff and pedantic adaptations of such writers as Agustin de Montiano y Luyando (1697-1764), Tomas de Iriarte (1750-1791), Garcia de la Huerta, and the well-known economist Gaspar de Jovellanos (1744-1811) were unable to interest the great mass of play-goers The only one who was really successful in composing on the French pattern some pleasant comedies, which owe much of their charm to the great purity of the language in which they are written, is Leandro Fernandez de Moratin, his best pieces are *La Nueva Comedia*, a parody on the extravagant work of Comella, a playwright of the period, *El Viejo y la Niña*, *El Baron*, and particularly *El Sí de las Niñas* It has to be added that the *saynete* was cultivated in the 18th century by one writer of genuine talent, Ramon de la Cruz, nothing helps us better to an acquaintance with the curious Spanish society of the reign of Charles IV than the intermezzos of this genial and light-hearted author

19th century The terrible struggle of the War of Independence (1808-1814), which was destined to have such important consequences in the world of politics, did not exert any immediate influence on the literature of Spain One might have expected as a consequence of the rising of the whole nation against Napoleon that Spanish writers would have given up seeking their inspiration from those of France, and would have tried to resume the national traditions which had been broken at the end of the 17th century But nothing of the sort occurred Not only the *afrancesados* (as those were called who had accepted the new régime), but also the most ardent partisans of the patriotic cause, continued in literature to be the submissive disciples of France Quintana, who in his inflammatory odes preached to his compatriots the duty of resistance and revenge, has nothing of the innovator about him, by his education and by his literary doctrines he remains a man of the 18th century The same may be said of Francisco Martinez de la Rosa (1789-1848), who, however, from his intercourse with Horace, whom he translated with skill into good Castilian verse, had a greater independence of spirit and a more highly trained and classical taste And, when romanticism begins to find its way into Spain and to enter into conflict with the spirit and habits of the 18th century, it is still to France that the poets and prose writers of the new school turn, much more than either to England or to Germany The first decidedly romantic poet of the generation which flourished about 1830 was the duke of Rivas, Angel de Saavedra (1791-1856), no one succeeded better in reconciling the genius of Spain and the tendencies of modern poetry, his epic poem *El Moro Expósito* and his drama of *Don Alvaro ó la Fuerza del Sino* belong as much to the old romances and old theatre of Spain as to the romantic spirit of 1830 On the other hand, José de Espronceda (1808-1842), who has sometimes been called the Spanish Musset, savours much less of the soil than the duke of Rivas, he is a quite cosmopolitan romanticist of the school of Byron and the French imitators of Byron, an exclusively lyric poet, he did not live long enough to give full proof of his genius, but what he has left is certainly exquisite José Zorrilla (born 1817) has a more flexible and exuberant but much more unequal talent than Espronceda, and if the latter has written too little it cannot but be regretted that the former should have produced too much, nevertheless, among a multitude of hasty performances, brought out before they had been matured, his *Don Juan Tenorio*, a new and fantastic version of the legend treated by Tirso de Molina and Molière, will always remain as one of the most curious specimens of Spanish romanticism In the dramatic literature of this period it is noticeable that the tragedy more than the comedy is modelled on the examples furnished by the French drama of the Restoration, thus, if we leave out of account the play of Garcia Gutierrez (born 1813) entitled *El Trovador*, which inspired the well-known opera of Verdi, and *Los Amantes de Teruel* of Juan Eugenio Hartzenbusch (born 1806), and a few others, all the dramatic work belonging to this date recalls more or less the manner of the professional playwrights of the boulevard theatres, while on the other hand the comedy of manners still preserves a certain originality and a genuine local colour Manuel Breton de los Herreros (1796-1873), who wrote as many as a hundred comedies, some of them of the first order after their kind, apart from the fact of their being written in language of great excellence, adheres with great fidelity to the tradition of the 17th century, he is the last of those writers who have preserved the feeling of the ancient *comedia* One prose writer of the highest talent must be mentioned along with Espronceda with whom he has in the moral aspect several features in common,—namely, D José de Larra (1809-1837), so famous by his pseudonym of "Figaro," with which he signed the greater number of his works Caustic in temper, of a keenly observant spirit, remarkably sober and clear as a writer, he was specially successful in the political pamphlet, the *article d'actualités*, to this category belong his *Cartas de un Pobrecito Hablador*, in which he ridicules without pity the vices and oddities of his contemporaries, his reputation is much more largely due to these letters than either to his somewhat feeble play of *Macias* or to his not very attractive novel *El Doncel de Enrique el Doliente* With Larra must be associated two other humoristic writers The first of these is Ramon Mesonero Romanos, "El Curioso Parlante" (born 1803), whose *Escenas Matritenses*, although not possessed of the literary value of Larra's articles, give pleasure by their good-natured gaiety and by the curious details they furnish with regard to the contemporary society of Madrid The other is Serafin Estébanez Calderon, "El Solitario" (1799-1867), who in his *Escenas Andaluzes* sought to revive the manner of the satirical and picaresque writers of the 17th century, in a uselessly archaic language of his own, patched up from fragments taken from Cervantes, Quevedo, and others, he has delineated with a peculiar but somewhat artificial grace various piquant scenes of Andalusian or Madrilenian life The most prominent literary critics belonging to the first generation of the century were Alberto Lista (1775-1848), whose critical doctrine may be described as a compromise between the ideas of French classicism and those of the romantic school, and Agustin Duran (died 1862), who made it his special task to restore to honour the old literature of Castile, particularly its

romances, which he had studied with unequalled thoroughness, and of which he published highly esteemed collections.

If the struggle between classicists and romanticists continued even after 1830, and continued to divide the literary world into two opposing camps it is plain that the new generation—that which occupied the scene from 1840 till about 1868—had other preoccupations. The triumph of the new ideas is now assured, only a few reactionaries are still seen to cling to the principles bequeathed by the 18th century. What was now being aimed at was the creation of a new literature which should be truly national and no longer a mere echo of that beyond the Pyrenees. To the question whether contemporary Spain has indeed succeeded in calling into existence such a literature, we may well hesitate to give an affirmative answer. It is true that in every species of composition, the gravest as well as the lightest, it can show works of genuine talent, but many of them are strikingly deficient in originality, all of them either bear unmistakable traces of imitation of foreign models, or show (more or less happily) the imprint of the older literature of the 17th century, to which the historical criticism of Duran and the labours of various other scholars had given a flavour of novelty. With this observation before him, the student can divide the authors of this period into two groups,—the one composed of those who, won by modern ideas, are more or less liberal in politics, and draw their inspiration in all they write from France or from what they are able to assimilate of other literatures through France, the other consisting of ultra-conservatives, whose dream in every sphere—letters, art, and politics—is the restoration of the Spain of the past. Nowhere does this antagonism manifest itself more clearly than in the drama. A play of Aureliano Fernandez Guerra might have been conceived and written by a contemporary of Lope or of Calderon, while a comedy of Adelardo Lopez de Ayala is moulded in the pattern given by the younger Dumas and by Augier. In the department of romance, on the other hand—much neglected by the writers of the first half of the century—the Spaniards have recovered something of the genius of Cervantes and their 17th century *novelas picarescas*. The art of constructing a story and of telling it in an agreeable way, which seemed for a long time to have been lost, is recovered in such authors as Fernan Caballero, Antonio de Trueba, Pedro Antonio de Alarcon, Juan Valera, Perez Galdos, and Pereda. These novelists are far from alike in method or in spirit, how widely separated, for example, are the somewhat banal facility and the sentimental catholicism of Fernan Caballero on the one hand, and the searching psychological analysis and the fine scepticism of Juan Valera on the other. But all have this in common, that they understand how to interest their readers, and how to make their characters live and speak. Incontestably the novel is the triumph of contemporary Spanish literature, it is almost the only kind of composition that actually lives with a life of its own and makes steady progress. One cannot say as much of lyric poetry, represented feebly enough by Ramon de Campoamor, Nuñez de Arce, and some others. Deficient inspiration, diffuseness of style, and want of precision in language characterize them all, it is unfortunately very easy to make mediocre verses in Spanish, and too many people give themselves over to the pursuit. Passing from the literature of amusement, we have still some very distinguished names to enumerate. Philosophy, indeed, has but one representative of merit, the traditionalist Jaime Balmes,—for the Krausist school, an importation from Germany, may be ignored here,—but history and literary criticism have been cultivated during the last thirty years or so with genuine success. Modesto Lafuente is in some sort the Mariana of the 19th century, much inferior as a writer to the celebrated Jesuit, he has, however, always manifested the same passion for his subject, the same persevering determination to raise a worthy monument of his fatherland, his *Historia de España*, in spite of all its defects, deserves respect, and is at least readable. Although primarily a politician, Antonio Canovas del Castillo has many of the qualities which go to the making of a good historian, he has evinced greater acuteness and larger acquirements than Lafuente, and his *Ensayo sobre la Casa de Austria en España*, founded upon a careful examination of a large number of documents, gives evidence of a correct judgment and praiseworthy impartiality. The literary history of old Spain has been treated in a masterly manner by Aureliano Fernandez Guerra in various studies devoted to the great writers of the 17th century, notably Quevedo, and also quite recently by a young and talented scholar, Marcelino Menéndez Pelayo, whose *Historia de las Ideas Estéticas en España*, a work as solid in its substance as it is pure in its style, would do honour to any veteran in literature. As regards criticism of contemporary literature, no one shows more spirit and taste than Juan Valera, whose delicate Andalusian nature has been matured by a refining education and by an adequate knowledge of foreign literatures.

Bibliography.—The base of the student's operations is always the great work of Nicolas Antonio, *Bibliotheca Hispana Vetus* and *Bibliotheca Hispana Nova*, in the revised and completed edition of Francisco Perez Bayer, Tomas Antonio Sanchez, and Juan Antonio Pellicer (Madrid, 1783-88, 4 vols fol.). The student can afford to disregard all the general histories which preceded Ticknor's *History of Spanish Literature* (New York, 1849, 3 vols 8vo, 4th ed., Boston, 1872, 3 vols 8vo), a work of solid value, especially from the bibliographical point of view, it is quite indispensable that the reader should consult also the Spanish translation by D. Pascual de Gayangos and Enrique de Vedia (Madrid, 1851-56) and the German translation of Julius with some important additions by Ferdinand Wolf (Leipsic, 1852-67). Nothing can be said in favour of the French translation by J. G. Magnabal (Paris, 1864-72). The *Historia Critica de la Literatura Española* of José Amador de los Rios (Madrid, 1861-65, 7 vols 8vo), although deficient in criticism and full of errors in fact, supplies some useful information as to the period prior to the 15th century, with which it exclusively deals. Menendez Pelayo's *Historia de las Ideas Estéticas en España* (Madrid, 1884-86, 3 vols 8vo), already referred to, is very instructive. For the 18th century, Leopoldo A. de Cueto's "Bosquejo Histórico-Crítico de la Poesia Castellana en el Siglo XVIII," prefixed to the first vol. of Rivadeneyra's *Poetas Liricos del Siglo XVIII*, is indispensable. For the 19th century there is not as yet any satisfactory work dealing with the literature as a whole, that of M. G. Hubbard, *Histoire de la Litterature Contemporaine en Espagne* (Paris, 1876, 1 vol 8vo), although superficial and inaccurate, is useful in the absence of anything better. Some descriptions of Castilian literature have been specially studied with care and competence, notably the drama, on which we have two thorough works,—Frederick von Schack's *Geschichte der dramatischen Literatur u. Kunst in Spanien* (Frankfort-on-the-Main, 1846-54, 3 vols 8vo), unfortunately now much behindhand, and in no way improved in this respect in the Spanish translation now in course of publication at Madrid under the superintendence of Eduardo de Mier, and Cayetano Alberto de la Barrera's excellent *Catalogo Bibliografico y Biografico del Teatro Antiguo Español* (Madrid, 1860, large 8vo). On the Castilian literature of the Middle Ages, the works to be consulted are Ferdinand Wolf's *Studien zur Geschichte der Spanischen u. Portugiesischen Nationalliteratur* (Berlin, 1859, 1 vol 8vo) and Manuel Milá y Fontanals's *De la Poesia Heroico-Popular Castellana* (Barcelona, 1874, 1 vol 8vo).

II. CATALAN LITERATURE.—Although the Catalan language is simply a branch of the southern Gallo-Roman, the literature, in its origin at least, ought to be considered as a mere appendix of that of Provence. Nay more, until about the second half of the 13th century there existed in the Catalan districts no other literature than the Provençal, and the poets of north-eastern Spain used no other language than that of the troubadours. Guillem de Bergadan, Uc de Mataplana, Ramon Vidal de Besalú, Guillem de Cervera, Serveri de Gerona, and several other verse writers of a still more recent date are all genuine Provençal poets, in the same sense as are those of

Poetry of Middle Ages.

Limousin, Quercy, or Auvergne, since they write in the *langue d'oc* and make use of all the forms of poetry cultivated by the troubadours north of the Pyrenees. Ramon Vidal (end of 12th century and beginning of 13th) was a grammarian as well as a poet; his *Rasos de Trobar* became the code for the Catalan poetry written in Provençal, which he called *Lemosi*, a name still kept up in Spain to designate, not the literary idiom of the troubadours only, but also the local idiom—Catalan,—which the Spaniards choose to consider as derived from the former. The influence of R. Vidal and other grammarians of his school, as well as that of the troubadours we have named, lasted for a very long time, and even after Catalan prose—an exact reflexion of the spoken language of the south-east of the Pyrenees—had given evidence of its vitality in some considerable works, the Catalan poetry remained faithful to the Provençal tradition. From the combination of spoken Catalan with the literary language of the troubadours there arose a sort of composite idiom, which has some analogy with the Franco-Italian current in certain parts of Italy in the Middle Ages, although in the one case the elements of the mixture are more distinctly apparent than are the romance of France and the romance of Italy in the other. The poetical works of Raymond Lully (Ramon Lull) (died 1315) are among the oldest examples of this Provençalized Catalan; one has only to read the fine piece entitled *Lo Desconort* ("Despair"), or some of his stanzas on religious subjects, to apprehend at once the eminently composite nature of that language. Muntaner in like manner, whose prose is exactly that spoken by his contemporaries, becomes troubadour when he writes in verse; his *Sermó* on the conquest of Sardinia and Corsica (1323), introduced into his *Chronicle* of the kings of Aragon, exhibits linguistically quite the same mixed character as is found in Lully, or, we may venture to say, in all the Catalan verse writers of the 14th century. These are not very numerous, nor are their works of any great merit. The majority of their compositions consist of what were called *noves rimades*, that is, stories in octosyllabic verse in rhymed couplets. There exist poems of this class by Pere March, by a certain Torrella, by Bernat Metge (an author more celebrated for his prose), and by others whose names we do not know; among the works belonging to this last category special mention ought to be made of a version of the romance of the *Seven Sages*, a translation of a book on good breeding entitled *Facetus*, and certain tales where, by the choice of subjects, by various borrowings, and even occasionally by the wholesale introduction of pieces of French poetry, it is clearly evident that the writers of Catalonia understood and read the *langue d'oui*. Closely allied to the *noves rimades* is another analogous form of versification—that of the *codolada*, consisting of a series of verses of eight and four syllables, rhyming in pairs, still made use of in one portion of the Catalan domain (Majorca).

of 15th century. The 15th century is the golden age of Catalan poetry. At the instigation and under the auspices of John I. (1387–1395), Martin I. (1395–1410), and Ferdinand I. (1410–1416), kings of Aragon, there was founded at Barcelona a consistory of the "Gay Saber," on the model of that of Toulouse, and this official protection accorded to poetry was the beginning of a new style much more emancipated from Provençal influence. It cannot be denied, indeed, that its forms are still of foreign importation, that the Catalan verse writers accept the prescriptions of the *Leys d'Amor* of Guillaume Molinier, and the names which they gave to their *cobles* (stanzas) are all borrowed from the same *art de trobar* of the school of Toulouse; but, a very noteworthy fact, their language begins to rid itself more and more of Provençalisms and tends to become the same as that of prose and of ordinary conversation. With Pere and Jaume March, Jordi de Sant Jordi, Johan de Masdovelles, Francesch Ferrer, Pere Torroella, Pau de Bellviure, Antoni Vallmanya, and, above all, the Valencian Auzias March (died 1459), there flourished a new school, of which the eclat lasted till the end of the 15th century, and which, as regards the form of its versification, is distinguished by its almost exclusive employment of eight-verse *cobles* of ten syllables, each with 'crossed' or "chained" rhymes (*cobla crohada* or *encadenada*), each composition ending with a *tornada* of four verses, in the first of which the "device" (*divis* or *senyal*) of the poet is given out. The greater number of these poems are still unedited or have only recently been extracted from the *cançoners*, where they had been collected in the 15th century. Auzias March alone, the most inspired, the most profound, but also the most obscure of the whole group, had the honour to be printed in the 16th century; his *cants d'amor* and *cants de mort* contain the finest verses ever written in Catalan, but the poet fails to keep up to his own high level, and by his studied obscurity occasionally becomes unintelligible to such a degree that one of his editors accuses him of having written in Basque. Of a wholly different class, and in quite another spirit, is the *Libre de les Dones* of Jaume Roig (died 1478), a Valencian also, like March; this long poem is a *nova rimada*, only *comediada*, that is to say, it is in quadrisyllabic instead of octosyllabic verse. A bitter and caustic satire upon women, it purports to be a true history,—the history of the poet himself and of his three unhappy marriages in particular. Notwithstanding its author's allegations, however, the *Libre de les Dones* does not seem to be other than a fiction; but it derives a very piquant interest from its really authentic element, its vivid picture of the Valencia of the 15th century and the details of the manners of that time. After this bright period of efflorescence Catalan poetry rapidly fell off, a decline due more to the force of circumstances than to any fault of the poets. The union of Aragon with Castile, and the resulting predominance of Castilian throughout Spain, inflicted a death blow on Catalan literature, especially on its artistic poetry, a kind of composition more ready than any other to avail itself of the triumphant idiom which soon came to be regarded by men of letters as the only noble one, and alone fit to be the vehicle of elevated or refined thoughts. The fact that a Catalan, Juan Boscan, inaugurates in the Castilian language a new kind of poetry, and that the Castilians themselves regard him as the head of a school, is important and characteristic; the date of the publication of the works of Boscan (1543) marks the end of Catalan poetry.

Prose of 13th–15th centuries. The earliest prose works in Catalan are later indeed than the poems of the oldest Catalan troubadours of the Provençal school, not dating farther back than from the close of the 13th century, but they have the advantage of being entirely original; their language is the very language of the soil which we see appearing in charters from about the time of the accession of James I. (1213). This is true especially of the chronicles, a little less so of the other writings, which, like the poetry, have difficulty in escaping the influence of the more polished dialect of the country to the north of the Pyrenees. Its chronicles are the best ornament of mediæval Catalan prose. Four of them,—that of James I., apparently reduced to writing a little after his death (1276) with the help of memoirs dictated by himself during his lifetime; that of Bernat Des Clot, which deals chiefly with the reign of Pedro III. of Aragon (1276–1286); that of Ramon Muntaner (first half of the 14th century), relating at length the expedition of the Catalan company to the Morea and the conquest

of Sardinia by James II, finally that of Pedro IV, The Ceremonious (1336–1387), genuine commentaries of that astute monarch, arranged by certain officials of his court, notably by Bernat Des Coll,—these four works are distinguished alike by the artistic skill of their narration and by the quality of their language, it would not be too much to liken these Catalan chroniclers, and Muntaner especially, to Villehardouin, Joinville, and Froissart. The Doctor Illuminatus, Raymond Lully, whose acquaintance with Latin was very poor,—his philosophical works were done into that language by his disciples,—wrote in a somewhat Provençalized Catalan various moral and propagandist works,—the romance *Blanquerna* in praise of the solitary life, the *Libre de les Maravelles*, into which is introduced a "bestiary" taken by the author from *Kalilah and Dimnag*, and the *Libre del Orde de Cavalleria*, a manual of the perfect knight, besides a variety of other treatises and opuscula of minor importance. The majority of the writings of Lully exist in two versions,—one in the vernacular, which is his own, the other in Latin, originating with his disciples, who desired to give currency throughout Christendom to their master's teachings. Lully—who was very popular in the lay world, although the clergy had a low opinion of him and in the 15th century even set themselves to obtain a condemnation of his works by the Inquisition—had a rival in the person of Francesch Ximenez or Eximeniz, a Franciscan, born at Gerona some time after 1350. His *Crestiá* (printed in 1483–84) is a vast encyclopædia of theology, morals, and politics for the use of the laity, supplemented in various aspects by his three other works—*Vida de Jesu Christ*, *Libre dels Angels*, and *Libre de les Dones*, the last-named, which is at once a book of devotion and a manual of domestic economy, contains a number of curious details as to a Catalan woman's manner of life and the luxury of the period. Lully and Eximeniz are the only Catalan authors of the 14th century whose works written in a vulgar tongue had the honour of being translated into French shortly after their appearance.

We have chiefly translators and historians in the 15th century. Antoni Canals, a Dominican, who belongs also to the previous century, translates into Catalan Valerius Maximus and a treatise of St Bernard, Bernat Metge, himself well-versed in Italian literature, presents some of its great masters to his countrymen by translating the *Griselidis* of Petrarch, and also by composing *Lo Sompni* ("The Dream"), in which the influence of Dante, of Boccaccio, and, generally speaking, of the Italy of the 13th and 14th centuries is very perceptible. The *Feyts d'Armes de Catalunya* of Bernat Boades, a knightly chronicle brought to a close in 1420, reveals a spirit of research and a conscientiousness in the selection of materials which are truly remarkable for the age in which it was written. On the other hand, Pere Tomich, in his *Histories é Conquestes del Reyalme d'Aragó* (1438), carries us back too much to the manner of the mediæval chroniclers, his credulity knows no bounds, while his style has altogether lost the naive charm of that of Muntaner. To the list of authors who represent the leading tendencies of the literature of the 15th century we must add the name of Johanot Martorell, a Valencian, author of the celebrated romance of chivalry *Tirant lo Blanch* (finished in 1460), which the reader has nowadays some difficulty in regarding as that "treasury of contentment" which Cervantes will have it to be.

16th–18th centuries.

With the loss of political was bound to coincide that of literary independence in the Catalonian countries. Catalan fell to the rank of a patois and was written less and less, lettered persons ceased to cultivate it, and the upper classes, especially in Valencia, owing to the proximity of Castile, soon affected to make no further use of the local speech except in familiar conversation. The 16th century, in fact, furnishes literary history with hardly more than a single poet at all worthy of the name—Pere Serafí, some of whose pieces, in the style of Auzias March, but less obscure, are graceful enough and deserve to live, his poems were printed at Barcelona in 1565. Prose is somewhat better represented, but, to tell the truth, it is only the erudite who persist in writing in Catalan,—antiquaries and historians like Pere Miguel Carbonell, compiler of the *Chroniques de Espanya* (1547), Francesch Tarafa, Pere Anton Beuter, also chroniclers, and some others not so well known. In the 17th and 18th centuries the decadence becomes still more marked. A few scattered attempts to restore to the Catalan, now more and more neglected by men of letters, some of its old life and brilliance, fail miserably. Neither Hieronim Pujades the historian, author of a *Coronica Universal del Principat* (Barcelona, 1609), nor even Dr Vicens Garcia, rector of Vallfogona (1582–1623), a verse-writer by no means destitute of verve or humour, but whose literary talent and originality have been very greatly exaggerated by the Catalans of the present day, was able to bring back his countrymen to a cultivation of the local idiom. Some sermons, some lives of saints, some books of devotion, some relations and complaints for the use of the people, exhaust the catalogue of everything written in Catalan throughout the whole area of its domains down to the beginning of the present century, not a single book of importance can be mentioned. Writers who were Catalan by birth had so completely unlearned their mother-tongue that it would have seemed to them quite inappropriate, and even ridiculous, to make use of it in serious works, so profoundly had Castilian struck its roots in the eastern provinces of Spain, and so thoroughly had the work of assimilation been carried out to the advantage of the official language of the court and of the Government.

Revival of Catalan language and literature.

In 1814 appeared the *Gramática y Apologia de la Llengua Cathalana* of Joseph Pau Ballot y Torres, which may be considered as marking the origin of a genuine renaissance of the grammatical and literary study of Catalan. Although the author avows no object beyond the purely practical one of giving to strangers visiting Barcelona for commercial purposes some knowledge of the language, the enthusiasm with which he sings the praises of his mother-tongue, and his appended catalogue of works which have appeared in it since the time of James I, sufficiently show that this was not his only aim. In point of fact the book, which is entitled to high consideration as being the first systematic Catalan grammar, written, too, in the despised idiom itself, had a great influence on the authors and literary men of the principality. Under the helping influence of the new doctrines of romanticism twenty years had not passed before a number of attempts in the way of restoring the old language had made their appearance, in the shape of various poetical works of very unequal merit. The *Oda á la Patria* (1833) of Buenaventura Carlos Aribau is among the earliest if not actually the very first of these, and it is also the best, the modern Catalan school has not produced anything either more inspired or more correct. Following in the steps of Aribau, Joaquin Rubió y Ors (*Lo Gayter del Llobregat*), Antonio de Bofarull (*Lo Coblejador de Moncada*), and soon afterwards a number of other verse writers took up the lyre which it might have been feared was never to sound again since it fell from the hands of Auzias March. The movement spread from Catalonia into other provinces of the ancient kingdom of Aragon, the appeal of the Catalans of the principality was responded to at Valencia and in the Balearic Isles. Later, the example of Provence, of the *felibrige* of the south of France, accelerated still further this renaissance movement, which received official recogni-

tion in 1859 by the creation of the *jochs florals*, in which prizes are given to the best competitors in poetry, of whom some succeed in obtaining the diploma of *mestre en gay saber*. It is of course impossible to foresee the future of this new Catalan literature,—whether it is indeed destined for that brilliant career which the Catalans themselves anticipate. In spite of the unquestionable talent of poets like Mariano Aguilo (Majorca), Teodoro Llorente (Valencia), and, among the younger of them, Jacinto Verdaguer (Catalonia), author of an epic poem *Atlantida* and of very fascinating *Cants Mistichs*, it is by no means certain that this generation will be succeeded by another to follow in its footsteps, or that such a restoration of a provincial literature has much chance of permanence at the very moment when all the peoples of Europe are tending rather towards unity and centralization in the matter of language. At all events, in order to secure even a comparative success for such a revival, it would be well if the language serving as its instrument were somewhat more fixed, and if its writers would no longer hesitate, as they at present do, between a pretentious archaism and the incorrectness of the most vulgar colloquialism. The few attempts of modern Catalans in the direction of romance writing and dramatic composition have not hitherto been particularly felicitous, and have not led to anything noteworthy.

INDEX

SPALATIN, GEORGE (1484–1545). George Burkhardt, a subordinate figure of some interest in the history of the Reformation in Germany, was born on January 17, 1484, at Spalt (whence he assumed the name Spalatinus), about 25 miles from Nuremberg, where his father was an artisan. He went to Nuremberg for education when he was thirteen years of age, and two years afterwards to the university of Erfurt, where he took his bachelor's degree within a year, in 1499. There he attracted the notice of Marschalk, the most influential professor, who made Spalatin his amanu-

ensis and took him to Wittenberg. In 1505 Spalatin went to Erfurt to study jurisprudence, was recommended to Mutianus, and was welcomed by the little band of German humanists of whom Mutianus was chief. His friend got him the post of teacher of young monks in a convent in the Georgenthal and pastor in the high church there. In 1508 he was ordained priest by Bishop John von Laasphe, who had ordained Luther. He had no great love for convent or pastoral work, and in 1509 Mutianus recommended him to Frederick the Wise, the elector of Saxony, who employed him to act as tutor to his son, the future elector, John Frederick. This appointment really determined Spalatin's life and work. He speedily gained the confidence of the famous elector, who employed him in many affairs. He sent him to Wittenberg in 1511 to act as tutor to his nephews, and procured for him a canon's stall in Altenberg. In 1512 the elector made him his librarian. This brought him into correspondence with a large number of literary men, and he began to collect all kinds of literary and especially of historical information, of which he made extensive use later in his chronicles. He was promoted to be court chaplain and confidential secretary to the elector, and took charge of all his private and public correspondence. He thus became one of the most important men at the electoral court, which then was the centre of German life.

Spalatin had never cared for theology, and, although a priest and a preacher, had been a mere humanist. It was to Luther that he owed his awakening to the reality of a spiritual life. How he first became acquainted with the reformer it is impossible to say—probably at Wittenberg; but Luther from the first exercised a great power over him, and became his chief counsellor in all moral and religious matters. His letters to Luther have been lost, but Luther's answers remain, and are extremely interesting. Spalatin was Luther's devoted friend during the stormiest days of the Reformation, and was the means of bringing the great elector to take the side of the outspoken professor in his university of Wittenberg. He read Luther's writings to the elector, and translated for his benefit those in Latin into German. He accompanied Frederick to the diet of Augsburg, and shared in the negotiations with the papal legates, Cajetan and Miltitz. He was with the elector when Charles was chosen emperor and when he was crowned. He was with his master at the diet of Worms. In short, he stood beside Frederick as his confidential adviser in all the troubled diplomacy of the earlier years of the Reformation. Singularly cautious, perhaps timid, before the crisis came and while it could be averted, Spalatin found courage when the crisis had come. He would have dissuaded Luther again and again from publishing books or engaging in overt acts against the papacy, but, when the thing was done, none was so ready to translate the book, or to justify the act.

On the death of Frederick the Wise, Spalatin was as much engaged in diplomatic service as before, but he no longer lived at court. He went into residence as canon at Altenberg, and incited the chapter to institute reforms somewhat unsuccessfully. He married in the same year. During the later portion of his life, from 1526 onwards, he was chiefly engaged in the visitation of churches and schools in electoral Saxony, reporting on the confiscation and application of ecclesiastical revenues. His practical experience in German affairs made him very successful in his delicate task, and he was asked to undertake the same work for Albertine Saxony. He was also permanent visitor of Wittenberg university, and made an annual report of its condition to the elector. Shortly before his death he fell into a state of profound melancholy, and died January 16, 1545, at Altenberg.

Spalatin left behind him a large number of literary remains, both published and unpublished. His original writings are almost all historical. A list of them may be found in Seelheim's *George Spalatin als sachs Historiograph*, 1878. There is no good life of Spalatin, nor can there be until his letters have been collected and edited, a work still to be done.

SPALATO (Slav *Split*), a city of Dalmatia, at the head of one of the thirteen departments (area 730 square miles; population in 1880 31,003), is situated on the seaward side of a peninsula lying between the Gulf of Brazza and the Gulf of Salona. Though not the capital, it is the most important city in the principality, is the see of a bishop, has a valuable museum of antiquities, and carries on an extensive trade in wine and oil. Since 1879 it has been the terminus of a railway running northwards to Sebenico and Siverić. Built on the low ground at the head of a beautiful bay, and thrown into relief by a background of picturesque hills rising close behind, Spalato has a striking sea-front, in which the leading feature is still the ruined façade of the great palace of Diocletian, erected in 303 A.D., to which the city owes its origin. In ground plan this is almost a square, with a quadrangular tower at each of the four corners. "Its faces correspond nearly with the four points of the compass. The south front (towards the harbour) measures 521 feet, or, with the towers, 598 feet 8 inches, and the eastern and western sides are each 705 feet 8 inches" (Wilkinson). The area included is 348,175 square feet, or, comprising the towers, 352,614 square feet, a little more than eight acres, or rather less than the area of the Escorial. There were four principal gates, with four streets meeting in the middle of the quadrangle, after the style of a Roman camp. The eastern gate (Porta Aenea) is destroyed; but, though the side towers are gone, the main entrance of the building, the beautiful Porta Aurea, in the west front, is still in fairly good preservation. The streets were lined with massive arcades. The vestibule now forms the Piazza del Duomo or public square; to the north east of this lies the mausoleum (not, as the older antiquaries had it, the temple of Jupiter), which has long been the smallest and darkest of cathedrals, and to the south-east is the temple of Æsculapius, which served originally as a kind of court chapel and has long been transformed into a baptistery. Architecturally the most important of all the many striking features of the palace is the arrangement in the vestibule by which the supporting arches spring directly from the capitals of the large granite Corinthian columns. This, as far as the known remains of ancient art are concerned, is the first instance of such a method; and thus, in Mr Freeman's words, "all Gothic and Romanesque architecture was in embryo in the brain of Jovius or his architect."

The name Spalato, or Spalatro (a very old spelling), which used to be explained as a corruption of Salonæ Palatium, is pretty certainly of different origin—the oldest form extant being Aspalathum (Constantine Porphyrogenitus) and early variants Spalathon, Spalathion, Spalatium (*Geogr. Rav.*). Dr Evans suggests a connexion with Aspalathus (the name of a prickly shrub) or perhaps with Asphaltus. Not long after Diocletian's death the buildings seem to have been turned into an imperial cloth factory, and as most of the workers were women we find it called a *gynæceum* (*Notitia*). About 4 miles from the palace lay the ancient city of Salona (Σαλῶνα or Σαλῶναι), which consisted of two parts, the earlier Roman city to the west and a later portion incorporated previous to the time of the Antonines. There are still remains at Salona of ancient city walls, an amphitheatre, &c., and a long line of walls extending "from the western side of the city for a mile and more nearly along the present road to Trau (Tragurium)." The purpose of this line of walls is not evident, and the date of its construction has been the subject of much discussion. Mr Freeman is disposed to consider them Roman workmanship.

Salona in its best days was one of the chief ports of the Adriatic, on one of the most central sites in the Roman world. Made a Roman colony after its second capture by the Romans (B.C. 78), it appears as Colonia Martia Julia and Colonia Claudia Augusta Pia Veteranorum, and bears at different periods the titles of respublica, conventus, metropolis, præfectura, and prætorium. In Christian times it became a bishop's see; and St Doimo or Dominus, its first bishop, still gives his name to the cathedral of Spalato. The city

was taken by Odoacer in 481 and by Totila in the 6th century. Recovered by Justinian in 535, it was in 544 and 552 the starting-point of Belisarius and Narses for their Italian expeditions. In the 7th century Salona was completely destroyed by the Avars; but the empty palace of Diocletian afforded an asylum for its inhabitants. The limits of the building proved sufficient for the new city up to the time that it passed under Hungarian and Venetian protection. Hungarian additions may still be seen above the Porta Aurea, and the large octagonal tower bears the name of Torre d'Harvoye from the Bosnian general who was created duke of Spalato by Ladislaus. The Venetians enclosed the town with regular curtains and bastions in 1645–1670. About 1807–1809 the castle was dismantled and parts of the walls were thrown down.

See Robert Adam, *Ruins of the Palace of Diocletian*, 1764; Cassas and Lavallée, *Voyage Pittoresque et Historique de l'Istrie*, 1802; Wilkinson, *Dalmatia and Montenegro*, 1848; Freeman, *Historical Essays*, 3d series, 1879, and *Subject and Neighbour Lands of Venice*, 1881. Both the first-mentioned works contain magnificent views and restorations of the architecture of the palace.

SPALDING, a market-town of Lincolnshire, England, in the Parts of Holland, is situated on the river Welland, and on the Great Northern and Great Eastern Railways, 93 miles from London. The town, standing in the heart of the Fens, is the centre of a rich agricultural district. Amongst the public buildings are five churches, the Johnson hospital (1881), the corn exchange (1856–57), the buildings of the mechanics' institute and of the Christian association and literary institute, and the district union-house. The parish church of St Mary and St Nicholas was built in 1284 and restored in 1865–66. The adjoining lady chapel (St Mary and St Thomas a Becket) was built in 1315; in 1588 it was appropriated for the grammar school endowed in 1568 by John Blanke and again in 1588 by John Gamlyn. A new grammar school was erected in 1881. Spalding has had a prison for upwards of 600 years; the present building, erected in 1824–25, was closed in 1884. The Welland is crossed at Spalding by two stone bridges. The existing high bridge, constructed in 1838, took the place of a wooden erection dating from the end of the 17th century; this last was built on the site of an older Roman bridge of two arches, the foundations of the centre pier of which were disclosed when the wooden bridge was constructed. The population of the town in 1871 was 9111, and in 1881 9260.

In 1051 Thorold of Bockenhale (now Bucknall, near Horncastle) gave his castle of Spalding and the chapel attached to it as a cell or monastery for the Benedictines of Crowland. Out of this grew the priory, which, however, was dissolved in 1535; the last fragments of its ruins were removed in 1832. About two miles north-east of Spalding stands the ruined chapel of Wykeham, dedicated to St Nicholas and built in 1311 by Prior Clement Hatfield. The building is of the Decorated period, and has been roofless since 1782; its interior dimensions are 43 feet long by 22 feet wide; the walls are 44½ feet high. Each side contains three three-light windows with moulded flowing tracery, and each end one four-light window of similar character. The only one which retains its original mullions and tracery is the centre window on the south side. After the Conquest the estates and priory of Spalding were given by William I to Ivo Tailbois, who found such a stout antagonist in Hereward the Wake, lord of Brunne or Bourn.

SPALDING, William (1809–1859), logician and literary historian, was born in Aberdeen in 1809. After a thorough education at the grammar school and at Marischal College there, he came to Edinburgh in 1830, where he was called to the bar in 1833. In that year he published a *Letter on Shakespeare's Authorship of the Two Noble Kinsmen*, which, by its critical acumen and the knowledge of the old dramatists which it displayed, attracted the notice of Jeffrey and procured the author an invitation to become a contributor to the *Edinburgh Review*. Before settling down to the business of the bar he undertook a prolonged Continental tour. He was absent fifteen months, the greater part of the time being spent in Italy, and in 1841 the fruits of his stay appeared in three volumes entitled *Italy and the Italian Islands from the Earliest Ages to the Present Time*. This learned and comprehensive work went through five editions in a few years. His attempts to gain a legal practice not proving successful, he became a candidate in 1838 for the chair of rhetoric in Edinburgh university, which he held till 1845, when he was appointed professor of logic in the university of St Andrews. He held the latter post till his death on the 16th November 1859.

Besides the works already mentioned, and various articles contributed to the *Edinburgh Review* and *Blackwood's Magazine*, he was the author of a concise *History of English Literature*, which has many merits and has been much used as a text book. He also wrote the articles "Logic" and "Rhetoric" (as well as a number of literary biographies) for the eighth edition of the *Encyclopædia Britannica*. The former article, written mainly on Hamiltonian lines, constitutes a systematic treatise on Formal Logic, and is honourably distinguished by its clear scientific exposition. By these two articles and his *History of English Literature* Spalding is chiefly remembered.

SPALLANZANI, Lazaro (1729–1799), is one of the most important and certainly also one of the most picturesque figures in the history of science during the 18th century. Born at Scandiano in Modena in 1729, he was at first educated by his father, who was an advocate. At the age of fifteen he was sent to the Jesuit college at Reggio di Modena, and was pressed to enter that body. He went, however, to the university of Bologna, where his famous kinswoman Laura Bassi, was professor, and it is to her influence that his scientific impulse has been usually attributed. With her he studied natural philosophy and mathematics, and gave also great attention to languages, both ancient and modern, but soon abandoned the study of law, and afterwards took orders. His reputation soon widened, and in 1754 he became professor of logic, metaphysics, and Greek in the university of Reggio, and in 1760 was translated to Modena, where he continued to teach with great assiduity and success, but devoted his whole leisure to natural science. He declined many offers from other Italian universities and from St Petersburg until 1768, when he accepted the invitation of Maria Theresa to the chair of natural history in the university of Pavia, which was then being reorganized. He also became director of the museum, which he greatly enriched by the collections of his many journeys along the shores of the Mediterranean. In 1785 he was invited to succeed Vallisneri at Padua, but to retain his services his sovereign doubled his salary and allowed him leave of absence for a visit to Turkey, where he remained nearly a year, and made many observations, among which may be noted those of a copper mine in Chalki and of an iron mine at Principi. His return home was almost a triumphal progress: at Vienna he was cordially received by Joseph II, and on reaching Pavia he was met with acclamations outside the city gates by the students of the university. During the following year his students exceeded five hundred. His integrity in the management of the museum was called in question, but a judicial investigation speedily cleared his honour, to the satisfaction even of his accusers. In 1788 he visited Vesuvius and the volcanoes of the Lipari Islands and Sicily, and embodied the results of his researches in a large work published four years later. He died from an apoplectic seizure, in 1799, at the age of seventy.

His indefatigable exertions as a traveller, his skill and good fortune as a collector, his brilliance as a teacher and expositor, and his keenness as a controversialist no doubt aid largely in accounting for Spallanzani's exceptional fame among his contemporaries; yet greater qualities were by no means lacking. His life was one of incessant eager questioning of nature on all sides, and his many and varied works all bear the stamp of a fresh and original genius, capable of stating and solving problems in all departments of science,—at one time finding the true explanation of "ducks and drakes" (formerly attributed to the elasticity of water) and at another helping to lay the foundations of our modern vulcanology and meteorology. His main discoveries, however, were in the field of physiology; he wrote valuable and suggestive papers on respiration, on the senses of bats, &c; while his highly important controversy with Needham and Buffon, in which he experimentally disproved the occurrence of spontaneous generation, has been already

referred to under ABIOGENESIS. In this regard also he was led to pay considerable attention to the infusorial animalcules. His great work, however, is the *Dissertationi de Fisica Animale e Vegetale* (2 vols., 1780). Here he first interpreted the process of digestion, which he proved to be no mere mechanical process of trituration, but one of actual solution, taking place primarily in the stomach, by the action of the gastric juice. Verifying this by the important experiment of artificial digestion outside the stomach in sealed tubes, he was attacked by John Hunter, but emerged victorious from the encounter. Of no less importance are his researches on reproduction, in which he experimentally settled the relative functions of the ovum and the spermatozoon. See REPRODUCTION.

SPANDAU, a strongly-fortified town in the province of Brandenburg, Prussia, is situated at the confluence of the Havel and Spree, 8 miles to the north-west of Berlin. It has recently been converted into a fortress of the first class, and is now the key of the defences of the capital. The Julius tower in the citadel, which is surrounded by water, contains the imperial war treasure (Reichskriegsschatz),—a sum of £6,000,000 in gold, kept in readiness for any warlike emergency. Besides numerous barracks, Spandau contains various military establishments appropriate to an important garrison town, and its chief industries are connected with the preparation of munitions of war. The Government factories for the manufacture of small arms, artillery, gunpowder, &c., cover upwards of 200 acres, and employ about 4000 workmen. The other industries are not very important; they comprise miscellaneous manufactures, fishing, boat-building, and some shipping on the Havel. The population in 1885, including the garrison of nearly 4000 men, was 31,463.

Spandau is one of the oldest places in the Altmark, and received town-rights in 1232. It afterwards became a favourite residence of the Hohenzollern electors of Brandenburg, and was fortified in 1577–83. In 1635 it surrendered to the Swedes, and in 1806 to the French. A short investment in 1813 restored it to Prussia. The population in 1816 was 6250.

SPANGENBERG, AUGUST GOTTLIEB (1704–1792), Count Zinzendorf's successor, and bishop of the Moravian Brethren, was born July 14, 1704, at Klettenberg, on the south of the Harz Mountains, where his father was court-preacher, and ecclesiastical inspector of the grafschaft of Hohenstein. Left an orphan at the early age of ten, he was sent to the excellent high school at Ilefeld, and passed thence (1722), in poorest circumstances, to Jena to study law. Prof. Buddeus received the poor youth into his family, and a "stipendium" was procured for him. Theology rather than law was his natural destination, and it needed only the impulse of the remark of Buddeus that the inevitable prospect before a true theologian is ignominy and trial to convert the student of law, who was profoundly exercised with religious conflicts, into a student of theology. Somewhat after the manner of the Wesleys at Oxford a little later, he studied the mystics, read the Bible, observed rigid devotional exercises, sought to quicken his sense of sin, avoided taking the Lord's Supper with unbelievers in the Lutheran Church, and took an active part in a religious union of students and in schools for poor children just outside Jena. He took his degree in 1726, and began to give free lectures on theology. In 1727 he made the acquaintance of the Moravian colony at Herrnhut and its head, Count Zinzendorf. A "collegium pastorale practicum" for the care of the sick and poor was in consequence founded by him at Jena, which the authorities at once broke up as a "Zinzendorfian institution." But Spangenberg's relations with the Moravians were confirmed by several visits to the colony, and the accident of an unfavourable appeal to the lot alone prevented his appointment as chief elder of the community, March 1733. Meanwhile his free lectures in Jena met with much acceptance, and led to an invitation from Gotthelf Francke to the post of assistant professor of theology and superintendent of the educational department of his orphanage at Halle. He accepted the invitation, and entered on his duties in September 1732. But it soon appeared that the differences between the Pietists of Halle and himself were far too serious to admit of any harmonious co-operation. He found their religious life too formal, legal, external, and worldly; and they could not sanction his comparative indifference to doctrinal correctness and his incurable tendency to separatism in church life. Spangenberg's participation in private observances of the Lord's Supper brought matters to a crisis. His intimate connexion with Count Zinzendorf was made a further charge against him. His preaching was pronounced "singular," and an "affected humility towards common people" obnoxious. He was offered by the senate of the theological faculty of Halle the alternative of doing penance before God, submitting to his superiors, and separating himself from Zinzendorf, or leaving the matter to the decision of the king, unless he preferred to "leave Halle quietly." The case came before the king, and on April 8, 1733, Spangenberg was conducted by the military outside the gates of Halle. At first he bent his steps to Jena, but Zinzendorf at once sought to secure him as a fellow-labourer, though, with that "jesuitry" of which Wesley subsequently complained, the count wished to obtain from him a declaration which would remove from the Pietists of Halle all blame with regard to the disruption. Spangenberg found amongst the Moravians his life-work. He could amongst them carry out his fundamental principle that the churches are but spheres in *all* of which Christians are to be found, and that the one church of Christ is only where believers live in Christian fellowship. He joined the Moravians at a moment when the stability of the society was threatened, and a wise organizer, enterprising missionary, and theological teacher was imperatively required. He became its theologian, its apologist, its statesman and corrector, through sixty long years of incessant labour. For the first thirty years (1733–62) his work was mainly devoted to the superintendence and organization of the extensive missionary enterprises of the body in Germany, England, Denmark, Holland, Surinam, Georgia, and elsewhere. His missionary work tended to still further modify and broaden his theological opinions, unsatisfactory as the Pietists of Halle had found them in 1733. It was on an island off Savannah that Spangenberg startled John Wesley with his questions and profoundly influenced his entire future career. One special endeavour of Spangenberg in Pennsylvania was to bring over the scattered Schwenkfeldians to his faith. In 1741–42 he was in England collecting for his mission and obtaining the sanction of the archbishop of Canterbury. During the second half of this missionary period of his life he superintended as bishop the churches of Pennsylvania, defended the Moravian colonies against the Indians at the time of war between France and England, became the apologist of his body against the attacks of the Lutherans and the Pietists, and did much to moderate the mystical extravagances of Zinzendorf, with which his simple, practical, and healthy nature was out of sympathy. The second thirty years of his work (1762–92) were devoted to the consolidation of the German Moravian Church. Zinzendorf's death (1760) had left room and need for his labours at home. At Herrnhut there were conflicting tendencies, doctrinal and practical extravagances, and the organization of the brethren was very defective. Spangenberg proved himself to be the man required. In 1777 he was commissioned to draw up an *idea fidei fratrum*, or compendium of the Christian faith of the United Brethren, which was published two years afterwards and became the accepted declaration of the Moravian belief. As compared with

Zinzendorf's own writings, this book exhibits the finer balance and greater moderation of Spangenberg's nature, while those offensive descriptions of the relation of the sinner to Christ in which the Moravians at first indulged are almost absent from it. In his last years Spangenberg devoted special attention to the education of the young, in which the Moravians have since been so successful. He died at Berthelsdorf, September 18, 1792. In addition to the *Idea Fidei Fratrum*, Spangenberg wrote, besides other apologetic books, a *Declaration ueber die zeither gegen uns ausgegangenen Beschuldigungen* (Leipsic, 1751), an *Apologetische Schlussschrift* (1752), *Leben des Grafen Zinzendorf* (1772–75), and his hymns are well known beyond the Moravian circle.

SPARROW (A.S. *Spearwa*, Icel. *Sporr*, Old High Germ. *Sparo*), a word perhaps (like the equivalent Latin *Passer*) originally meaning almost any small bird, but gradually restricted in signification and nowadays in common English applied to only four kinds, which are further differentiated as Hedge-Sparrow, House-Sparrow, Tree-Sparrow, and Reed-Sparrow—the last being a BUNTING (vol. iv. p. 525)—though when used without a prefix the second of these is usually intended.

1. The HEDGE-SPARROW, called "Dunnock" in many parts of Britain, the *Accentor modularis* of ornithologists, is the little brown backed bird with an iron-grey head and neck that is to be seen in nearly every garden throughout the country, unobtrusively and yet tamely seeking its food, which consists almost wholly of insects, as it progresses over the ground in short jumps, each movement being accompanied by a slight jerk or shuffle of the wings. Though on the Continent it regularly migrates, it is one of the few soft-billed birds that reside throughout the year with us, and is one of the earliest breeders,—its well-known greenish-blue eggs, laid in a warmly-built nest, being recognized by hundreds as among the surest signs of returning spring; but a second or even a third brood is produced later. The cock has a sweet but rather feeble song; and the species has long been accounted, though not with accuracy, to be the most common dupe of the Cuckow. Several other species are assigned to the genus *Accentor*, but all, except the Japanese *A. rubidus*, which is the counterpart of the British Hedge-Sparrow, inhabit more or less rocky situations, and one, *A. collaris* or *alpinus*, is a denizen of the higher mountain-ranges of Europe, though it has several times strayed to England. The taxonomic position of the genus is regarded by some systematists as doubtful; but to the present writer there seems no good reason for removing it from the group which contains the Thrushes and Warblers (*Turdidæ* and *Sylviidæ*), to which it was long referred.

2. The HOUSE-SPARROW, the *Fringilla domestica* of Linnæus and *Passer domesticus* of modern authors, is far too well known to need any description of its appearance or habits, being found, whether in country or town, more attached to human dwellings than any other wild bird; nay, more than that, one may safely assert that it is not known to thrive anywhere far away from the habitations or works of men, extending its range in such countries as Northern Scandinavia and many parts of the Russian empire as new settlements are formed and land brought under cultivation. Thus questions arise as to whether it should not be considered a parasite throughout the greater portion of the area it now occupies, and as to what may have been its native country. Moreover, of late years it has been inconsiderately introduced to several of the large towns of North America and to many of the British colonies, in nearly all of which, as had been foreseen by ornithologists, it has multiplied to excess and has become an intolerable nuisance, being unrestrained by the natural checks which partly restrict its increase in Europe and Asia. Whether indeed in the older seats of civilization the House-Sparrow is not decidedly injurious to the agriculturist and horticulturist has long been a matter of discussion, and no definite result that a fair judge can accept has yet been reached. It is freely admitted that the damage done to growing crops is often enormous, but as yet the service frequently rendered by the destruction of insect-pests cannot be calculated. Both friends and foes of the House Sparrow write as violent partisans,[1] and the truth will not be known until a series of experiments, conducted by scientifically-trained investigators, has been instituted, which, to the shame of numerous agricultural and horticultural societies, has not yet been done. It is quite likely that the result will be unfavourable to the House Sparrow, from what has been said above as to its being so dependent on man for its subsistence; but, while the evil it does is so apparent,—for instance, the damage to ripening grain-crops,—the extent of the counterbalancing benefit is quite uncertain, and from the nature of the case is often overlooked. In the South of Europe the House-Sparrow is in some measure replaced by two allied species, *P. hispaniolensis* and *P. italiæ*, whose habits are essentially identical with its own; and it is doubtful whether the Sparrow of India, *P. indicus*, is specifically distinct; but Africa has several members of the genus which are decidedly so.

3. The TREE-SPARROW, the *Fringilla montana* of Linnæus and *Passer montanus* of modern writers, in appearance much resembling the House-Sparrow, but easily distinguishable by its reddish-brown crown, the black patch on the sides of its neck, and its doubly-barred wings,[2] is a much more local species, in England generally frequenting the rows of pollard-willows that line so many rivers and canals, in the holes of which it breeds; but in some Eastern countries, and especially in China, it frequents houses, even in towns, and so fills the place of the House-Sparrow. Its geographical distribution is extensive, and marked by some curious characters, among which may be mentioned that, being a great wanderer, it has effected settlements even in such remote islands as the Færoes and some of the Outer Hebrides.

That the genus *Passer* properly belongs to the *Fringillidæ* is admitted by most ornithologists, yet there have been some who would refer it to the Weaver-birds, *Ploceidæ*, if they are to be accounted as forming a distinct Family,—a matter which is not at all clear. The American birds called "Sparrows" have little in common with the members of the genus *Passer*, and probably belong rather to the family *Emberizidæ* than to the *Fringillidæ*. (A. N.)

SPARROWHAWK. See HAWK.

SPARTA, after Athens, was the most powerful and important of the Greek states. Her fame rested mainly on her soldiers, her military discipline, her somewhat narrow patriotism, and her intense political conservatism; in general intellectual culture, in art and in everything connected with it, she was immeasurably inferior to Athens, and even to some of the other Greek states, though there is evidence to show that a genius and a taste for sculpture and music were by no means wanting to her citizens. Her eminent men were almost all eminent as soldiers, and few of them had any pretensions to rank as able and enlightened statesmen. No such man as Themistocles or Pericles ever appeared in Sparta; she produced no great thinkers or philosophers; the typical Spartan, in short, was a brave and well-trained soldier, with a decided simplicity of character and strong religious scruples, amounting to what we must call superstition, which from time to time were a hindrance to prompt action and discredited the state in the public opinion of Greece.

Sparta was not so much a city as a cluster of open villages in a plain in the heart of Laconia (see vol. xi. plate I.), in the middle valley of the Eurotas, on the west bank of the river, between the ranges of Taygetus and Parnon, and built in part on the spurs of these mountains. Its situation was very picturesque: "hollow, lovely Lacedæmon"[3] is Homer's description. Taygetus on the west rises to its greatest height of nearly 8000 feet just above the city, with primeval forests on its lower slopes, in which Spartans hunted the stag and the wild boar. Sparta seems to have been about six miles in circuit; it was not, like most Greek cities, near the coast,—Gythium,

[1] The most recent attacks upon it are contained in the various issues of the *Report of Observations of Injurious Insects and Common Crop Pests*, annually made by Miss Eleanor Ormerod, and in a little volume bearing the title of *The House Sparrow*, published in 1885, and consisting chiefly of three essays by Mr J. H. Gurney, jun., Lieut. Col. C. Russell, and Prof. Coues, but the last has only reference to the behaviour of the bird in the United States of America, where, from the reason above assigned, its presence was expected by almost all well-informed persons to be detrimental.

[2] A more important difference is that the two sexes have almost the same plumage, while in the House-Sparrow they are unlike in this respect.

[3] Lacedæmon was simply another name for Sparta, though sometimes it seems to stand for the surrounding district.

the chief port of Laconia, being 30 miles distant, nor was it built with anything like the compactness of an Athens or a Corinth The houses for the most part stood in spacious gardens, an open-air life being altogether to the Spartan taste, and well suited to the pleasant genial climate of the valley The olive still grows to great perfection in the neighbourhood, and the silk is said to be of particularly fine quality The mountain ranges round the city gave it a very strong defensive position, and for a long period Sparta was without walls or fortifications, trusting exclusively to the prowess of her citizens till she was seriously menaced by the victorious Macedonians in the 4th century B C The city was never a very splendid one, the houses were plain and simple and there seem to have been no public buildings of striking magnificence There was the so-called Brazen House of Athene on a hill within a large enclosure, with plates of bronze which gave it its name, on which, among other mythological scenes, were represented the labours of Hercules and the exploits of the great twin brethren, Castor and Pollux, who were specially honoured at Sparta There was the theatre, still to be traced in huge quadrangular blocks of stone, and there were porticos and colonnades, and the chapels and tombs of Spartan heroes, such as Lycurgus, Leonidas, Brasidas Sparta delighted to honour her worthy citizens, and paid them divine honours after death The site of the city has not been thoroughly investigated, but it is a question whether much remains worth bringing to light What has hitherto been discovered is poor and disappointing Sparta's greatness as a city, as Thucydides (i 10) clearly implies, fell very far short of her political importance as a state [1]

Sparta's history, passing over her share in the prehistoric Trojan War under her king Menelaus, the brother of Agamemnon, begins with the legislation of Lycurgus in the 9th century B C It was this, as has been explained in the article LYCURGUS, which made Sparta what she was, a state whose aim it was rather to hold her own within the Peloponnesus than to launch out into doubtful enterprises far away from home Sparta was not naturally aggressive or ambitious, she was not easily roused to action even in great emergencies She was safe amid her mountains from the perils to which other Greek cities were exposed It would seem that in early days Argos had been decidedly the first power in the Peloponnesus, Sparta being second to her by a long interval The relative position of the two states was reversed soon after the time of Lycurgus The spirit and vigour which his discipline infused no doubt enabled Sparta, after two severe wars in the 8th and 7th centuries, to accomplish at last the complete conquest of Messene, the south-western portion of the Peloponnesus, and so to become the undisputed mistress of at least two-fifths of the whole peninsula By the year 600 B C Sparta was quite in the first rank of Greek states, and it was generally felt that she had a right to take the lead in Greek politics In the 6th century she put down the tyrants, the heads of the democratic and popular party, in several Greek cities, and drove, for a time at least, the reforming and innovating Clisthenes from Athens Sparta was the steady foe of democracy and popular government The Spartans were themselves a small landowning aristocracy, in the midst of a comparatively numerous population, consisting of so called Perioeci (dwellers round about), the aboriginal inhabitants, in fact, of Laconia, and of Helots or serfs, taken to a great extent from the conquered Messenians The government was highly centralized, it was wholly in the hands of the Spartans, the Perioeci having no share in it, though many of them may have themselves been land owners, or at any rate have held land under Spartan landlords, and been well-to-do and prosperous The Helots were farm labourers bound to the soil, slaves in every sense of the word, anything like self-respect being studiously made impossible for them Spartans could put down a popular rising or a slave insurrection with cold-blooded cruelty, and in a panic following on an earthquake of unusual violence in 464 there was a deliberately-planned massacre of a multitude of Helots for the safety of Sparta, carried out and executed by Spartans in person A calculating selfishness was a marked trait in Spartan character Sparta seems always to have put her own interests before those of Greece, though she claimed to be the leading and representative Greek state She was cautious and even timid, though the courage of her individual citizens in war was unsurpassed Every Spartan was a hero on the battlefield, and a Spartan army was long assumed to be invincible Sparta was not much of a colonizing state, but she could point to the famous city of Tarentum in southern Italy as her offspring, and to Lyctus (*Il*, ii 647, xvii 611) in Crete, whence came warriors to the Trojan War In 491, when Greece was threatened with invasion by Persia, we find Athens appealing to Sparta and urging a complaint against the Æginetans as traitors to Greece for having given earth and water, the symbols of submission, to the emissaries of the great king In 480 a Spartan admiral commanded the Greek fleet off Artemisium against Xerxes, and in the following year a Spartan general, Pausanias, commanded the united forces of Greece in the famous battle of Platæa All this implies a distinct recognition of Sparta as the head of Greece The Persian War over, Athens under Cimon and Pericles developed extraordinary energy and took Sparta's place Sparta indeed seems to have retired upon her laurels, and it was not without reluctance and much urgent pressure that she embarked in the Peloponnesian War, which, after twenty-eight years of hard fighting, ended in the overthrow of the Athenian empire and the capture of Athens by Lysander in 405 Sparta contributed greatly to the final result by despatching an able officer, Gylippus, to the relief of Syracuse in 414, when the city was on the point of surrendering to the Athenian armament It was the decisive success of Gylippus in Sicily which turned the scale against Athens The crushing blow of Ægospotami in 405, which annihilated her fleet and left her defenceless, and the subsequent surrender of the city transferred the supremacy of Greece once more to Sparta, but not for much more than thirty years Sparta's policy was ungenerous and short-sighted, it consisted in establishing little oligarchical factions under Spartan control in the Greek cities, and soon degenerated into a tyranny which became utterly odious All Sparta's worst qualities came out during this period "autonomy," which had been her watchword throughout the war against Athens, became a dead letter under her rule, and the freedom of city life, so dear to a Greek, was crushed out under her officials and commissioners, whom she thrust on a number of Greek cities Still more did she disgust all the better men of Greece by concluding, after a series of intrigues for her own selfish ends, a peace with Persia in 387, known as the peace of Antalcidas, the Spartan through whom it was negotiated It was a dishonourable peace for Greece, as its effect was to facilitate Persian intervention in Greek affairs and make the king of Persia the arbiter of Greek disputes and differences Meanwhile Athens was recovering herself; the tables were soon turned on Sparta, and her maritime

[1] For topographical details we must refer the reader to the elaborate works of the German scholar Curtius on the Peloponnesus and works based on them Mure's *Greece* and Leake's *Morea* should be consulted.

power collapsed before the united action of Athens and Persia In the Peloponnesus Sparta was still supreme, but Thebes, she felt, might become a dangerous rival and must be humbled She insisted that the townships of Bœotia must be "autonomous" and independent of Thebes, and so contrived to pick a quarrel with that state, which to Sparta's cost had at that time the famous Epaminondas, the greatest, perhaps, of Greek generals, among her leading citizens In 371 came Sparta's crushing defeat at Leuctra, a blow from which she never really recovered, though her courage and military discipline long survived it But her prestige was gone Epaminondas carried the war into the heart of Laconia and penetrated to Sparta itself His victory at Mantinea in 362 gave independence to Messene, and Sparta was now politically ignored by her old allies

From this time Sparta almost drops out of Greek history She took no part in the struggle against Macedon, no Spartan soldier stood by the side of the Athenians and Thebans at Chæronea She seems to have sunk into political apathy, very possibly she may have had to concentrate all her remaining strength and energy in keeping down her Helots and the native population of Laconia When Alexander was winning his victories in Asia, she intrigued feebly against Macedon, and she would take no part in the congress of the Greek states at Corinth which declared Alexander "Leader of the Greeks"

She appears once again, but as not much more than the ghost of her former self, in the 3d century B C, attempting vainly in 281 to unite Greece against the Macedonian Antigonus, and repulsing Pyrrhus from her walls in 272, Spartan women working at the city's defence, and a few Spartan warriors driving back the formidable soldier-king There was still the old spirit about her, but the number of her citizens is said to have dwindled down to 700, and in her last days, with a wealthy few in the midst of a poor and needy people, Sparta had shrunk into the narrowest and feeblest of oligarchies In the latter half of the 3d century B C, in the days of the Achæan league, a vigorous but unsuccessful attempt at internal reforms and a restoration of the old discipline of Lycurgus was made by two of her kings, Cleomenes and Agis She sank finally, we know not how, under the degrading dominion of a sort of robber chief, Nabis, who fastened his tyranny upon her by the support of emancipated slaves and mercenaries of the lowest class Her best citizens were put to death or banished, and she was debased into a refuge of pirates and robbers Nabis and his vile gang were put down by Philopœmen in the name of the Achæan league, and Philopœmen completed his work by razing the walls of Sparta and abolishing her old institutions Rome simply looked on, knowing well that she was mistress of the situation, and let matters drag on till 146, when she captured Corinth, and closed the page of Greek history (W J B)

SPARTACUS, the leader of a formidable insurrection of slaves against Rome in the 1st century B C, was a Thracian by birth, and perhaps a descendant of the kings of Panticapæum whose name he bore He served in the Roman army, but seems to have deserted, for we are told that he was taken prisoner and sold as a slave Destined for the arena, he, with a band of his fellow-gladiators, broke out of a training-school at Capua and took refuge on Mount Vesuvius (73 B C) Here he maintained himself as a captain of brigands, his lieutenants being Crixus and Œnomaus, who like himself had been gladiators. Their numbers soon swelled through the accession of runaway slaves and desperados from the neighbourhood A hastily-collected force of 3000 men under Claudius endeavoured to besiege and starve out the rebels, but the latter clambered down the precipices and put the Romans to flight Swarms of hardy and desperate men now joined the rebels, and when the prætor Publius Varinius took the field against them he found them entrenched like a regular army on the plain But they gave him the slip, and when he advanced to storm their lines he found them deserted From Campania the rebels marched into Lucania, a country better suited for guerilla warfare Here, in spite of the commands and entreaties of Spartacus, the slaves committed excesses of lust and cruelty Varinius followed him, but was defeated in several engagements and narrowly escaped being taken prisoner Spartacus, whose heart was "where his rude cottage by the Danube lay," now endeavoured to push northward His object was to cross the Alps and allow the slaves, who were mostly Thracians, Germans, and Gauls, to disperse to their homes But intoxicated by success his wild followers refused to listen to him, their thoughts were all of plunder, and their track was marked by the devastation of Italy Vola, Nuceria, Thurii, Metapontum, were sacked with every circumstance of savage cruelty In this serious position of affairs the senate despatched both consuls against the rebels (72 B C) The German slaves under Crixus, who had separated from the rest, were defeated and cut in pieces at Mount Gargarus in Apulia by the prætor Arrius But Spartacus overthrew both consuls, one after the other, and then pressed towards the Alps Cassius, governor of Cisalpine Gaul, and the prætor Manlius flung themselves in his way at the head of 20,000 men, but were trampled under foot Freedom was within sight, but with fatal infatuation the slaves declined to abandon Italy Spartacus led them against Rome, but their hearts seem to have failed them, for the capital was not attacked Spartacus then occupied the port of Thurii and tried to procure supplies of iron and bronze, probably through the pirates He also endeavoured by means of the herds of horses captured in southern Italy to form a body of cavalry The conduct of the war against Spartacus, together with eight legions, was now committed to the prætor Marcus Crassus He restored discipline by decimating the first troops that ran before the enemy In the next battle Spartacus was worsted and retreated towards the straits of Messina, intending to cross into Sicily, where he would have been welcomed by fresh hordes of slaves, but the pirates who had agreed to transport his army proved faithless Crassus endeavoured to shut in the rebels by carrying a ditch and rampart right across the peninsula, a distance of 32 miles But on a wintry night Spartacus forced the lines, and once more Italy lay at his feet Disunion, however, was at work in the rebel camp The Gauls and Germans had again drawn off from the main body Crassus attacked and destroyed them Spartacus was now fain to secure a retreat into the mountains of Petelia (near Strongoli in Calabria), and succeeded in inflicting a reverse on the pursuing army But his men refused to retreat farther, and in a pitched battle which followed soon afterwards the rebel army was annihilated Spartacus, who had stabbed his horse before the battle began, fell sword in hand A body of the rebels which had escaped from the field was met and cut in pieces by Pompey, who, with his usual knack of reaping where other men had sowed, claimed and received the credit of having put an end to the war (71 B C) Six thousand slaves, who had not found a soldier's death, were crucified along the high road from Capua to Rome

A history of the war against Spartacus has to be pieced together with much uncertainty from the vague, scrappy, and somewhat discrepant accounts of Plutarch (*Crassus*, 8-11), Appian (*Bell Civ*, i 116–120), Florus (ii 8 [iii 20]), Livy (*Epit*, xcv, xcvi., xcvii.), and Sallust (fragments of the *Histories*) Sallust's description seems to have been full and graphic, but unfortunately only a few fragments of it remain

SPECIES In logic the term "species" is applied to any group of individuals agreeing in some common attribute or attributes, and included along with other groups in a higher category, that of "genus," which comprehends the fewer and more general attributes in which all agree and ignores those in which they differ The application of these terms in logic is thus purely relative, any genus, however large, may be but a species of a still larger genus But in arranging the innumerable objects of the natural sciences the naturalist finds it necessary to restrict the terms "species" and "genus" to the two lowest groupings and to distinguish the higher aggregates by special terms, as "family," "order," "class," &c Early writers had but a loose conception of many different "kinds" of animals and plants, and spoke only of species and genus in their purely logical relations, with varying breadth of content The term "species" was limited to its natural history usage in the end of the 17th century by John Ray His conception of "specific characters" rested, not only on close and constant resemblance in outward form, but also on the likeness of offspring to parent, a considerable measure of variability being, however, recognized Amongst subsequent authors this conception of common descent or parentage became more and more prominent, while the progress of successful definition of species made the limits of their variability seem always narrower and of less importance, and in this way the useful working conception of the tolerable definiteness of species gradually crystallized into the absolute dogma of their fixity Then Linnæus in his *Philosophia Botanica* gave the aphorism "species tot sunt diversæ, quot diversæ formæ ab initio sunt creatæ" (we reckon just as many species as there were forms created at the beginning), which was generally accepted Buffon's obstinate rejection of the Linnæan classification was associated with a belief in the modifiability of species, and showed some foresight of the doctrine elaborated soon afterwards by LAMARCK (*q v*) The general acceptance of this dogma was, however, effected by the influence of Cuvier, its overthrow dates only from the publication of Darwin's *Origin of Species* (1859), of which the argument need not be here repeated. (See EVOLUTION, MORPHOLOGY) The genealogical conception of species was thus established more firmly than ever, though cleared from its former associations, in Haeckel's phrase, the species is the whole succession of organisms which exhibit the same form in the same environment The rash generalization, that distinct species are to be recognized by their incapacity for the production of fertile hybrids, was next overthrown, while closer study has cleared away the notion of the equal definiteness of all specific forms We now know that, while many forms, like the pearly nautilus or the Venus's fly-trap, do indeed exhibit the most perfect specific definiteness, the demarcation of equally definite species in other genera is rendered impossible by the existence of the most complete series of transitional forms, and the number of the species defined thus comes to depend simply on the personal equation of the systematist, on his predilection for "lumping" or "splitting," as the case may be. Thus, for example, the number of described German species of hawkweed (*Hieracium*) has ranged from 300 for one author, through 106 for another and 52 for a third, to less than 20 for a fourth Similar instances of variable genera are afforded by the willows and the brambles, and many other common forms This wide variability, as might be expected, seems to be more prevalent among the lowest forms of life, and the classical example of the relativity and variability of species has been furnished by Haeckel's beautiful monograph on the calcareous sponges (*Monographie der Kalkschwamme*, Jena, 1872), in which he offers twelve distinct arrangements of the same set of forms from various points of view, among which the two most nearly conventional propose respectively 21 genera and 111 species and 39 genera and 289 species All such variable forms are in fact species in the making, which become definite in proportion as certain varieties become especially adapted to their environment, and become isolated by the dying out of the intermediate forms With these limitations, however, the working usefulness of the morphological conception of species remains undiminished The want of any absolute standard of specific difference is largely made up by practical experience and common sense, and the evolutionary systematists are less in danger than were their predecessors of either exaggerating or understating the importance of mere varieties (See VARIATION)

SPECIFIC GRAVITY See HYDROMETER, vol XII p 536 *sq*

SPECTACLES are flat glasses, prisms, spherical or cylindrical lenses, employed to detect and correct defects of the eyes They are made usually of crown glass or rock crystal ("pebbles"), the latter being somewhat lighter and cooler to wear They are mounted in the well-known rigid spectacle frame when for continuous use,—eye-glasses being preferable where they are worn intermittently, and hand-glasses or lorgnettes where they are required to supplement temporarily the spectacles usually worn, or where, as with extreme shortness of sight, no glass could be employed with comfort for any length of time

Preserves—Preserves are used to conceal deformities or to protect the eyes in the many conditions where they cannot tolerate bright light, such as ulceration and inflammation of the cornea, certain diseases of the iris, ciliary body, choroid, and retina They are made of bluish, "smoked," or almost black coloured glass, and are of very various shapes, according to the amount of obscuration necessary

Prisms—Prisms are of great value in cases of double vision due to a slight tendency to squinting, caused by weakness or over-action of the muscular apparatus of the eyeball Prisms deflect rays of light towards their bases Hence, if a prism is placed in front of the eye with its base towards the nose, a ray of light falling upon it will be bent inwards, and seem to come from a point further out from the axis of vision Conversely, if the base of the prism is turned towards the temple, the ray of light will seem to come from a point nearer the axis, and will induce the eye to turn inwards, to converge towards its fellow In cases of myopia or short-sight owing to weakness of the internal recti muscles, the eyes in looking at a near object, instead of converging, tend to turn outwards, and so double vision results If a suitable prism is placed in front of the eyes the double vision may be prevented These prisms may be combined with concave lenses, which correct the myopia, or, since a concave lens may be considered as composed of two prisms united at their apices, the same effect may be obtained by making the distance between the centres of the concave lenses greater than that between the centres of the pupils Again, to obviate the necessity for excessive convergence of the eyes so common in hypermetropia, the centre of the pupil should be placed outside the centre of the corrective convex lenses, these will then act as prisms with their bases inwards Where, on the other hand, there is no tendency to squinting, care must be taken in selecting spectacles that the distances between the centres of the glasses and the centres of the pupils are quite equal, otherwise squinting, or at any rate great fatigue, of the eyes may be induced

Spherical Lenses—Biconcave, biconvex, and concavo-convex (meniscus) lenses are employed in ophthalmic practice in the treatment of errors of refraction Until recently these spherical lenses were numbered in terms of their focal

length, the inch being used as the unit Owing principally to differences in the length of the inch in various countries, this method had great inconveniences, and is now giving place to a universal system, in which the unit is the refractive power of a lens whose focal length is one metre This unit is called a "dioptric" (usually written "D") A lens of twice its strength has a refractive power of 2 D, and a focal length of half a metre, and so on

Concave lenses are used in the treatment of myopia or short-sight In this condition the eye is elongated from before backwards, so that the retina lies behind the principal focus All objects, therefore, which lie beyond a certain point (the conjugate focus of the dioptric system of the eye, the far point) are indistinctly seen, rays from them have not the necessary divergence to be focused in the retina, but may obtain it by the interposition of suitable concave lenses Concave lenses should never be used for work within the far point, but they may be used in all cases to improve distant vision, and in very short-sighted persons to remove the far point so as to enable fine work such as sewing or reading to be done at a convenient distance The weakest pair of concave lenses with which one can read clearly test types at a distance of 18 feet is the measure of the amount of myopia, and this fully correcting glass may be worn in the slighter forms of short-sight In higher degrees, where full correction might increase the myopia by inducing a strain of the accommodation, somewhat weaker glasses should be used for near work In the highest degrees the complete correction may be employed, but lorgnettes are generally preferred, as they can be removed when the eyes become fatigued It must be remembered that short-sight tends to increase during the early, especially the school, years of life, and that hygienic treatment, good light, good type, and avoidance of stooping are important for its prevention

Convex Lenses—In hypermetropia the retina is in front of the principal focus of the eye Hence in its condition of repose such an eye cannot distinctly see parallel rays from a distance and, still less, divergent rays from a near object The defect may be overcome more or less completely by the use of the accommodation In the slighter forms no inconvenience may result, but in higher degrees prolonged work is apt to give rise to aching and watering of the eyes, headache, inability to read or sew for any length of time, and even to double vision and internal strabismus Such cases should be treated with convex lenses, which should be theoretically of such a strength as to fully correct the hypermetropia Practically it is found that a certain amount of hypermetropia remains latent, owing to spasm of the accommodation, which relaxes only gradually At first glasses may be given of such a strength as to relieve the troublesome symptoms, and the strength may be gradually increased till the total hypermetropia is corrected Young adults with slighter forms of hypermetropia need glasses only for near work, elderly people should have one pair of weak glasses for distant and another stronger pair for near vision These may be conveniently combined, as in Franklin glasses, where the upper half of the spectacle frame contains a weak lens, and the lower half, through which the eye looks when reading, a stronger one

Anisometropia—It is difficult to lay down rules for the treatment of cases where the refraction of the two eyes is unequal If only one eye is used, its anomaly should be alone corrected, where both are used and nearly of equal strength, correction of each often gives satisfactory results

Presbyopia—Where distant vision remains unaltered, but, owing to gradual failure of the accommodative apparatus of the eye, clear vision within 8 inches becomes impossible, convex lenses should be used for reading of such a strength as to enable the eye to see clearly about 8 inches distance Presbyopia is arbitrarily said to commence at the age of forty, because it is then that the need of spectacles for reading is generally felt, but it appears later in myopia and earlier in hypermetropia It advances with years, requiring from time to time spectacles of increasing strength

Cylindrical Lenses—In astigmatism, owing to differences in the refractive power of the various meridians of the eye, great defect of sight, frequently accompanied by severe headache, occurs This condition may be cured completely, or greatly improved, by the use of lenses whose surfaces are segments of cylinders They may be used either alone or in combination with spherical lenses The correction of astigmatism is in many cases a matter of considerable difficulty, but the results to vision almost always reward the trouble

Convex spectacles were invented towards the end of the 13th century, perhaps by Roger Bacon Concave glasses were introduced soon afterwards Airy, the astronomer, about 1827, corrected his own astigmatism by means of a cylindrical lens Periscopic glasses were introduced by Dr W H Wollaston (A BR)

SPECTROSCOPY The spectroscope is an instrument which separates luminous vibrations of different wave-lengths, as far as is necessary for the object in view It consists of three parts,—the collimator, the prism or grating, and the telescope The collimator carries the slit through which the light is admitted and a lens which converts the diverging pencil of light into a parallel pencil The pencils carrying light of different wave-lengths are turned through different angles by the prism or grating, which is therefore the essential portion of the spectroscope The telescope serves only to give the necessary magnifying power, and is dispensed with in small direct vision spectroscopes For a description of the different kinds of prism used, see OPTICS, and for an explanation of the action of the grating, see UNDULATORY THEORY The most important adjustment in the spectroscope is that of the collimator Especially in instruments of large resolving power it is essential for good definition that the light should enter the prism or fall on the grating as a parallel pencil For a method allowing an easy and accurate adjustment for each kind of ray, see an article in *Phil Mag*, vol vii p 95 (1879)

Prisms are nearly always used in the position of minimum deviation, but, if the collimator is properly adjusted, this is by no means a necessary condition for good definition Prisms as generally cut, with an isosceles base, give the greatest resolving power in the position of minimum deviation, but the loss in resolving power is not great for a small displacement The dispersion and magnifying power of a prism can be considerably altered by a change of its position, and a knowledge of this fact is of great value to an experienced observer The use of a prism in a position different from that of minimum deviation is, however, a luxury which only those acquainted with the laws of optics can indulge in with safety

Lord Rayleigh has given the theory of the spectroscope under OPTICS, and shown on what its resolving power depends There is no connexion between resolving power and dispersion, any value of resolving power being consistent with any value of dispersion To obtain large resolving power with small dispersion requires, however, the use of inconveniently large telescopes and prisms or gratings It is easy, on the other hand, to obtain small resolving power together with large dispersion

The following definitions would be found of general use if adopted *Resolving Power*—The unit resolving power of a spectroscope in any part of the spectrum is that resolving power which allows the separation of two lines differing by the thousandth part of their own wave-length or wave-number,—the wave-number being the number

of waves in unit length *Purity*.—The unit purity of a spectrum is that purity which allows the separation of two lines differing by the thousandth part of their own wave-length or wave-number. We speak of the resolving power of a spectroscope and of the purity of a spectrum. The resolving power is a constant for each spectroscope, and independent of the width of the slit. The purity of a spectrum, on the other hand, depends on the width of the slit, unless that width is small compared to a certain quantity presently to be mentioned. The resolving power of a spectroscope is numerically equal to the greatest purity of spectrum obtainable by it.

Adopting these definitions, we get from Lord Rayleigh's equations for the resolving power R of a grating

$$1000\,R = mn,$$

where n is the total number of lines used on the grating and m the order of the spectrum. For a spectroscope with simple prisms we get

$$1000\,R = -(t_2 - t_1)\frac{\delta\mu}{\delta\lambda},$$

where t_2 and t_1 are the greatest and smallest lengths of paths in the dispersive medium. If we put for the refractive index of the medium $\mu = A + B/\lambda^2$ we may write

$$1000\,R = 2B(t_2 - t_1)/\lambda^3$$

It will be seen that, while the resolving power of a spectroscope with grating depends only on the order of the spectrum and is independent of the wave-length for each order, the resolving power of a spectroscope with prism will vary inversely as the third power of the wave-length λ, so that the resolving power will be about eight times as great in the violet as in the red (see OPTICS). If compound prisms are used we must write

$$1000\,R = 2(B_2 t_2 - B_1 t_1)/\lambda^3,$$

where t_2 is the greatest effective length of path in one medium, t_1 in the other medium, B_2 and B_1 being the dispersive constants for the two media.

The purity P of a spectrum is given by the equation

$$P = \frac{\lambda}{d\psi + \lambda}R,$$

where d denotes the width of slit and ψ is the angle subtended by the collimator lens at the slit. If the slit is sufficiently narrowed, $d\psi$ may be made small compared to λ, and in that case the purity of the spectrum is independent of the width of slit and equal to the resolving power. If, on the other hand, a wide slit is used, so that $d\psi$ is large compared to λ, the purity becomes inversely proportional to the width of slit. In actual work the slit is generally of such width that neither term in the denominator of the expression for purity can be neglected.

There is a necessary limit to the resolving power of all optical instruments, depending on the fact that light consists of a series of groups of waves incapable of interfering with each other. If it is true, as is generally believed, but without sufficient reason, that a retardation of 50,000 wave-lengths is sufficient to destroy the capability of interference—that is to say, that the groups consist on the average of approximately 50,000 waves—the maximum purity obtainable in any spectroscope is 50. The closest line resolved with a grating, as far as the present writer is aware, requires a resolving power of about 100. Professor Piazzi Smyth has with prisms realized a purity of 50. It would seem, therefore, that the theoretical limit of purity has very nearly been reached, for, though the estimate of 50,000 waves to the group is in all probability too small, there are other considerations which render it highly improbable that the total number of waves to the group should, for sunlight at any rate, be more than two or three times larger. The limit of possible purity will very likely depend on the temperature of the luminous body.

Almost the greatest practical difficulty which the spectroscopist has to contend with generally is the want of sufficient light. The following remarks apply to line spectra principally, but they hold also almost entirely for the spectra of fluted bands, which break up into lines under high resolving power. The maximum illumination for any line is obtained when the angular width of the slit is equal to the angle subtended by one wave-length at a distance equal to the collimator aperture. In that case $d\psi = \lambda$ and the purity is half the resolving power. Hence when light is a consideration we shall not, as a rule, realize more than half the resolving power of the spectroscope. If the visual impression depended only on the intensity of illumination, a further widening of the slit should not increase the visibility of a line. As a matter of fact spectroscopists generally work with slits wider than that which theoretically gives full illumination. The explanation of the fact is physiological, visibility depending on the apparent width of the object. If different spectroscopes have their slits of such width that the apparent width of a line as seen by the eye is the same, and if the magnifying power is such that the pupil is just filled with light, the purity of the spectrum is directly proportional to the resolving power. We come to the conclusion, therefore, that for both narrow and wide slits the efficiency of a spectroscope depends exclusively on its resolving power. It has been pointed out by Lord Rayleigh that, owing to the want of definition in the optical images on the retina when the full aperture of the pupil is used, the pencil must be contracted to a third or a quarter of its natural width, if full resolving power is to be obtained. This is accompanied with a serious loss of light, which can be partly obviated by contracting the horizontal aperture only (the refracting edge being supposed vertical). There are two ways of doing this. One consists in the use of magnifying half prisms. But the loss of light by reflexion in simple half prisms more than counterbalances the advantage; compound half prisms like those used by Christie may, however, be employed. We may also use prisms of three or four times the height of the effective horizontal aperture, with correspondingly large telescopes, and then by the eye-piece contract the beam until its vertical section fills the pupil. The latter plan, though theoretically best, involves more expensive apparatus and prisms of very homogeneous material.

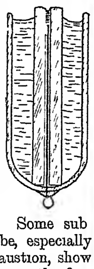
The question of illumination is important also when photography is used for spectroscopic analysis. For a given intensity of the source of light the intensity of the image on the sensitive film will be directly proportional to the solid angle of the cone of light forming the last image, and will be independent of the arrangement of intermediate lenses. Hence lenses with as short a focus compared to aperture as is consistent with good definition should be used in the camera.

The methods of recording and reducing spectroscopic observations are described in all books and treatises on the subject and may therefore be passed over here.

A lens is often used to concentrate the light of the source on the slit. There is some loss of light due to reflexion from the surface of the lens, but its position, aperture, and focal length do not affect the luminosity of the spectrum seen as long as the whole collimator is filled with light.

Bodies are rendered luminous for spectroscopic investigation either by being placed in the Bunsen flame or by the help of the electric current. A little difficulty may arise where the body is given in solution and does not show its characteristic lines in the flame. Lecoq de Boisbaudran takes the spark from the surface of the solution. The present writer has found the tube sketched in the figure on the next page a great improvement on those commonly used, if a sufficient quantity of the solution is at

hand, otherwise the method is too wasteful. The current is brought into the solution by a platinum wire, sealed into a small glass tube, the platinum wire reaches about to the level of the open end of the tube. A capillary of thick-walled glass tubing is placed over the platinum wire, the liquid rises in the capillary and sparks can be taken as from a solid. The lines due to the glass are easily eliminated. If a small quantity of material only is available, the plan adopted by Bunsen and extensively used by Hartley[1] seems the most successful. Pointed pieces of charcoal (Bunsen) or pieces of graphite pointed to a knife edge (Hartley) are impregnated with the liquid, and the spark is taken from them. Some substances, when introduced into a vacuum tube, especially near the negative pole, and under great exhaustion, show a characteristic phosphorescence. Becquerel was the first to examine the spectra shown under these circumstances, and Crookes has lately used the same method with great success.



Spectra of Metalloids.

A good deal of discussion has taken place on the spectra of the metalloids, owing to the fact that they seem to be able to give different spectra under different circumstances. Spectra have occasionally been assigned to the elements which on further investigation were found to belong to some compound present. According to the general opinion of spectroscopists at present, different spectra of the same elements are always due to different allotropic conditions. If a complex molecule breaks up into simpler molecules the breaking up is always accompanied by a change of spectrum.

Nitrogen.—(*a*) The line spectrum appears whenever a strong spark (jar discharge) is taken in nitrogen gas. It is always present when metallic spectra are examined by the ordinary method of allowing the jar discharge to pass between metallic poles.[2] Hartley (*Phil. Trans.*, 1884, part i.) has measured the ultra-violet lines of the air spectrum, but has not separated the oxygen from the nitrogen lines. (*b*) The band spectrum of the positive discharge, which is generally called the band spectrum of nitrogen, always appears when the discharge is sufficiently reduced in intensity. The spectrum consists of two sets of bands of different appearance, one in the less refrangible part and one in the more refrangible part of the spectrum,—the two sets of bands overlapping in the green. Hence some observers believe the spectrum to be made up of two distinct spectra. Plucker and Hittorf (*Phil. Trans.*, 1865) give a coloured drawing of this spectrum, which is one of the most beautiful that can be observed. The most complete drawing of it is given by Piazzi Smyth (*Trans. Roy. Soc. Edin.*, vol. xxxii. part iii.), and there is also a good drawing by Hasselberg (*Mém. Acad. Imp. de St Pétersb.*, vol. xxxii.). (*c*) The glow which surrounds the negative electrode in an exhausted tube shows in many cases a spectrum which, as a rule, is not seen in any other part of the tube. The memoir of Hasselberg contains a drawing of it. The spectrum seen when a weak spark is taken in a current of ammonia is neither that of nitrogen nor that of hydrogen, but must be due to a compound of these gases. When the pressure of the gas is reduced, a single band is seen having a wave-length from 5686 to 5627 *X*th metres (*Nature*, vi. p. 359). When a spark is taken from a liquid solution of ammonia a more complicated spectrum appears (Lecoq de Boisbaudran), and, if ammonia and hydrogen are burnt together either in air or oxygen, a complicated spectrum is obtained the chemical origin of which has not been satisfactorily explained. Drawings of it are given by Dibbits (*Pogg. Ann.*, cxxii. p. 518) and by Hofmann (*Pogg. Ann.*, cxlvii. p. 95). The absorption spectrum of the red fumes of nitrogen tetroxide has often been mapped; the most perfect drawing is given by Dr B. Hasselberg (*Mém. Acad. Imp. de St Pét.*, xxvi.). According to Moser (*Pogg. Ann.*, clx. p. 177), three bands close to the solar line C disappear when the vapour is heated. Recently Deslandes has obtained in vacuum tubes some ultra-violet bands which seem to be due to a compound of nitrogen and oxygen (*C. R.*, chap. i. p. 1256, 1885).

Oxygen.—(*a*) The elementary line spectrum of oxygen is that which appears at the highest temperature to which we can subject oxygen, that is, whenever the jar and air break are introduced into the electric circuit. It consists of a great number of lines, especially in the more refrangible part of the spectrum. (*b*) The compound line spectrum of oxygen appears at lower temperatures than the first. It consists, according to Piazzi Smyth, of six triplets and a number of single lines. This spectrum corresponds to the band spectrum of nitrogen. (*c*) The continuous spectrum of oxygen appears at the lowest temperature at which oxygen is luminous. The wide part of a Plucker tube, for instance, filled with pure oxygen generally shines with a faint yellow light, which gives a continuous spectrum. Even at atmospheric pressure this spectrum can be obtained by putting the contact breaker of the induction coil out of adjustment, so that the spark is weakened. (*d*) The spectrum of the negative glow was first accurately described by Wullner, and is always seen in the glow surrounding the negative electrode in oxygen. It consists of five bands, three in the red and two in the green. For further information respecting these spectra, see Schuster (*Phil. Trans.*, clxx. p. 37, 1879) and Piazzi Smyth (*Trans. Roy. Soc. Edin.*, vol. xxxii. part iii.). According to Egoroff, the A and B lines of the solar spectrum are due to absorption by oxygen in our atmosphere, and some recent observations of Janssen seem to support this view.

Carbon.—(*a*) The line spectrum appears when a very strong spark is sent through carbonic oxide or carbonic acid. The ultra violet lines observed by Hartley when sparks are taken from graphite electrodes also belong probably to this spectrum. (*b*) Considerable discussion has taken place as to the origin of the spectrum seen at the base of a candle or a gas flame. At first observations seemed to point to the fact that it was due to a hydrocarbon. It has been ascertained, however, that sparks taken in cyanogen gas, even when dried with all care, show the spectrum, and a flame of cyanogen and oxygen gives the same bands brilliantly. These facts have convinced the majority of observers that the spectrum is a true carbon spectrum. The best drawing is given by Piazzi Smyth, who ascribes the spectrum, however, to a hydrocarbon. The flame of cyanogen, which had already been examined by Faraday and Draper before the days of spectrum analysis, shows a series of bands in the red, reaching into the green. There is no doubt that they are due to a compound of nitrogen and oxygen. Another series of bands in the blue, violet, and ultra-violet have been also proved by Liveing and Dewar to be due to a compound of nitrogen and carbon. If the discharge is passed at low pressure through carbonic acid or carbonic oxide a spectrum is seen which seems to belong to carbonic oxide. A very beautiful and remarkable drawing of this spectrum, especially of its most brilliant band, has been published by Piazzi Smyth.

Very little need be said of the remaining metalloids, as we do not possess a sufficiently careful examination of their spectra. Chlorine, bromine, and iodine show bands by absorption. If a spark is passed through the gases line spectra appear. Sulphur volatilized in a vacuum tube may show either a line or a band spectrum under the influence of the electric discharge. The absorption through the vapour of sulphur is continuous at first on volatilization, but as the vapour is heated to 1000° the continuous spectrum gives way to a band spectrum. A spark through the vapour of phosphorus gives a line spectrum. We may obtain the spectra of fluorine, silicon, and boron by comparing the spectra given by sparks taken in atmospheres of fluoride of boron and fluoride of silicon.

Spectra of Metals and their Compounds.

Hydrogen.—If sparks are taken through hydrogen, four well-known lines appear in the visible region of the spectrum. The remarkable series of ultra violet lines photographed by Dr Huggins in the spectra of some stars which in their visible part show hydrogen chiefly has suggested the question whether the whole series is not due to that gas. This has now been proved to be the case by Cornu, who has recently examined the hydrogen spectrum with great care. In vacuum tubes filled with hydrogen a complicated spectrum often appears which is so persistent that nearly all observers have ascribed it to hydrogen (though Salet had given reasons against that conclusion). According to Cornu, the purer the gas the feebler does this spectrum become, so that the above mentioned line spectrum seems to be the only true hydrogen spectrum. A flame of hydrogen in air or oxygen shows a number of lines in the ultra-violet belonging apparently to an oxide of hydrogen (Liveing and Dewar, Huggins). Aqueous vapour gives an absorption spectrum principally in the yellow.

Alkali Metals.—The metals of the alkali group are distinguished by the fact that their salts give the true metal spectra when rendered luminous in the Bunsen burner, that is to say, their salts are decomposed and the radiation of their metallic base is sufficiently powerful to be visible at the temperature of the flame. Their spectra are not so easily seen if sparks are taken from the liquid solution, but Lecoq de Boisbaudran has obtained fine spectra of sodium and potassium by taking the spark from a semi-fluid bead of the sulphates. The most complete description of the spectra of sodium and potassium seen when the metals are heated up in the voltaic arc is given by Liveing and Dewar (*Proc. Roy. Soc.*, xxix. p. 378, 1879), who have also mapped their ultra-violet lines (*Phil. Trans.*, 1883, pt. i.). Abney has found a pair of infra-red lines

[1] *Phil. Trans.*, clxxv. p. 49 (1884).

[2] We may refer once for all to Watts, *Index of Spectra*, for a list of wave-lengths of the different spectra.

belonging to sodium, with wave-lengths 8187 and 8199 (*Proc Roy Soc*, xxxii p 443, 1881) Becquerel finds lines in the infra-red at 11,420 The vapour of sodium and potassium heated up in a tube is coloured and shows a spectrum of fluted band, but in the case of sodium the yellow line is always present at the same time It is probable that the band spectrum belongs to the vapour, containing two atoms in each molecule, and that at higher temperatures the molecules are split up, the single atoms showing the line spectra Both potassium and sodium show an additional absorption line (5510 for Na and 5730 for Ka) at the temperature at which the fluted bands appear According to a suggestion of Liveing and Dewar, these lines may depend on the presence of hydrogen, which it is very difficult to exclude These experimenters have also described interesting but complicated absorption phenomena depending on the simultaneous presence of two or more metals Thus sodium and magnesium show a band in the green ($\lambda=5300$), which does not appear when sodium alone or magnesium alone is volatilized Potassium and magnesium show similarly two lines in the red (*Proc Roy Soc*, xxvii p 350, 1878) If a spark is taken from potassium in an atmosphere of carbonic oxide a band appears (5700) depending probably on a combination between the potassium and the carbonic oxide Lockyer has observed certain curious phenomena (*Proc Roy Soc*, vol xxii p 378) taking place at the temperature at which the band spectrum of sodium changes into the line spectrum, these phenomena deserve a fuller investigation Lithium furnishes a good example of a change in the relative intensity of lines at different temperatures At the temperature of the flame the red line is the most powerful, an orange line being also seen When a spark is taken from a liquid solution the orange line is far the strongest, and a blue line is seen, which in its turn rapidly gains in intensity as the temperature is raised When the spark is taken from solutions of different strengths the more concentrated solution shows a change in relative intensity of lines in the direction in which an increase of temperature would act Combination of the metals with transparent acids does not when in solution show any appreciable absorption in the visible part of the spectrum, but Soret has mapped their ultra-violet absorption

Metals of Alkaline Earths —Calcium, strontium, and barium are distinguished by the fact that their volatile compounds give fine spectra in the Bunsen flame The more stable salts, as the phosphates and silicates, give the reaction only feebly or not at all When a salt like the chloride of barium is introduced into the flame the spectrum is seen to change gradually, the spectrum seen at first is different according as the chloride, bromide, or iodide is used, while the spectrum which finally establishes itself is the same for the different salts of the same metal Mitscherlich, who was the first to investigate carefully these phenomena (*Pogg Ann*, cxxi p 459, 1864), ascribes the spectra seen at first to the compound placed in the flame, while gradually the oxide spectrum gets the upper hand This explanation has always been accepted, and receives support from the fact that the bromide spectrum is strengthened by introducing bromine vapour into the flame, and the other compound spectra can be similarly strengthened by introducing suitable vapours There is an observation, however, made by Professors Liveing and Dewar which in one case is not compatible with Mitscherlich's explanation "A mixture of barium carbonate, aluminium filings, and lamp black heated in a porcelain tube gave two absorption lines in the green, corresponding in position to bright lines seen when sparks are taken from a solution of barium chloride, at wave-lengths 5242 and 5136, marked α and β by Lecoq de Boisbaudran" These two lines, or rather bands, are the brightest in the spectrum commonly ascribed to barium chloride In addition to the compound spectra the brightest of the metallic lines seen at a low temperature appear in the flame The metallic line is in the violet with calcium, in the blue with strontium, and in the green with barium Sparks taken from a solution of the metallic salts show the compound spectra well, and in addition more of the true metallic lines than the flame The best drawings of the compound spectra are those given in Lecoq de Boisbaudran's *Atlas*, but measurements with higher resolving powers are much wanted When the salts are introduced into the voltaic arc numerous metallic lines appear which have been mapped by Thalén Liveing and Dewar have investigated those lines which can be reversed and have also mapped the ultra-violet spectra Captain Abney has mapped a pair of infra-red lines belonging to calcium between 8500 and 8600, and, according to Becquerel, with the help of a phosphorescent screen bands or lines appear of still lower refrangibility (8830 to 8880) Lockyer (*Phil Trans*, clxiii p 253, 1873, and clxiv p 805, 1874) has measured and mapped as regards their length the lines of these as well as of many of the other metals

Metals of Magnesium Group —Beryllium presents comparatively simple spectroscopic phenomena, as far as it has hitherto been investigated Two green lines were mapped by Thalén and five in the ultra-violet by Hartley (*Jour Chem Soc*, June 1883) The spectrum of magnesium is well known from its green triplet, but the vibrations of the metal seem very sensitive to a change of conditions Full details are given by Liveing and Dewar in *Proc Roy Soc*, xxxii p 189 These authors have found that some of the bands seen occasionally, when magnesium wire is burned in air, are due to a compound of magnesium and hydrogen The spectrum appears when sparks are taken from magnesium poles in an atmosphere containing hydrogen For a description of the peculiarities of the flame, arc, and spark spectrum, the reader is referred to the original paper The ultra violet spectrum, which contains several repetitions of the green triplet, has also been mapped and measured by Hartley and Adeney (*Phil Trans*, clxxv, 1874, pt i) The spectra of zinc and cadmium are obtained either by sparks from liquid solution or by the spark, with Leyden jar, from the metal poles The ultra-violet spectra show for both elements a remarkable series of triplets, the lines of the cadmium triplet being about three times as far apart as those of the zinc triplets The least refrangible of the series is in the blue with wave-lengths 5085 1, 4799 1, 4677 0 for cadmium, and 4809 7, 4721 4, 4679 5 for zinc

Lead Group —The spectrum of lead is best obtained by taking the spark from the metallic poles Care must be taken, however, to renew the surface frequently, otherwise the oxide spectrum will gradually make its appearance The oxide itself shows its spectrum, according to Lecoq de Boisbaudran, in the Bunsen burner The salts of thallium show the principal metal line at the temperature of the flame The spark spectrum is more complicated The ultra-violet spectra of both lead and thallium have been mapped

Copper Group —The spectra of the metals belonging to this group are easily obtained in the ordinary way When copper chloride is introduced into the Bunsen flame a fine spectrum of bands is seen It is the same spectrum which is found when common salt is thrown upon white hot coals This reaction for copper chloride is very sensitive, but it has never been satisfactorily decided whether the presence of copper is really necessary for its production or whether the spectrum belongs to a peculiar condition of chlorine vapour Silver when first volatilized gives a green vapour, which at a low temperature shows continuous absorption, but at a higher temperature a spectrum of fluted bands (Lockyer) Mercury shows its lines with great brilliancy if introduced and heated in a vacuum tube Some of the lines widen easily, and at higher pressures a continuous spectrum completely covers the background The copper salts in aqueous solution absorb principally the red end of the spectrum, the green salts also the violet end The glass, coloured green with oxide of copper, transmits through sufficient thickness exclusively the yellow and green rays between D and E (H W Vogel)

Cerium Group —*Yttrium* gives a good spark spectrum from the solution of the chloride, the salts show no absorption bands Crookes has found, however, that a certain substance yields brilliant phosphorescent bands under the influence of the negative pole in a vacuum tube These bands he has, after a lengthy investigation, put down to yttrium compounds, and explained the changes they undergo in different compounds and the sensitiveness of the reaction Lecoq de Boisbaudran, who obtains the same spectrum by taking a spark (without Leyden jar) from solutions, making the solution the positive pole, has expressed an opinion that the bands are not due to yttrium but to two substances provisionally called by him $Z\alpha$ and $Z\beta$ He has also under certain conditions seen a higher temperature spectrum, which he ascribes to $Z\gamma$, leaving it undecided whether $Z\gamma$ is a new substance or identical with $Z\alpha$ (*Phil Trans*, 1883, p 891, and *C R*, ci p 552, cii p 153) —*Lanthanum* is easily recognized by a strong spark spectrum —*Cerium*, like yttrium and lanthanum, has no peculiar absorption spectrum when in combination and solution, although the salts are strongly coloured yellow, its line spectrum has characteristic lines in the blue —*Didymium* is characterized spectroscopically by the fine absorption spectra of its salts Different salts show slightly different spectra, but they can be recognized at first sight as didymium spectra The crystals of didymium salts show remarkable differences in the absorption spectra according to the direction in which the ray traverses the crystal Light reflected from the powdered salts shows the characteristic spectrum According to Auer von Welsbach (*Monatsschr f Chemie*, vi p 477), didymium has lived up to its name δίδυμοι, "twins," for by fractional crystallization he has found it to be an intimate mixture of two substances, each of them giving half the absorption spectrum and half the emission spectrum of didymium —*Terbium* has a characteristic line spectrum when the spark is taken from a solution of the salts —The salts of *erbium* give a characteristic absorption spectrum, but till recently the drawings of it contained also absorption bands due to thulium and holmium The spectrum of erbium, as previously mapped by Thalén, belongs almost exclusively to ytterbium, but he has recently mapped the lines belonging to what is now known as erbium (*C R*, xci p 326) Erbium salts heated in the Bunsen burner show a spectrum of bright bands without apparent volatilization —*Ytterbium*, discovered by Marignac (atomic weight 173, Nilson), gives an absorption band in the ultra violet Its luminous spectrum is rich in lines (Thalén, *C R*, xci p 326) —*Samarium*, also discovered by

Marignac and called by him originally Yβ, gives absorption bands in the visible part and in the ultra-violet (Soret, *C R*, xc p 212) It frequently occurs with didymium, and most of the maps of the didymium spectrum contain the samarium bands When precipitated with another metal it shows a brilliant phosphorescent spectrum (Crookes), which, however, is slightly different according to the metal The peculiar yttrium spectrum is very weak even when it is mixed in considerable quantities with samarium But when the quantity of yttrium is increased to about 60 per cent a very rapid change takes place, and afterwards it is the samarium spectrum which is very weak A band in the orange peculiar to the mixture, weak in pure samarium and absent in yttrium, is strongest in a mixture containing about 80 per cent of samarium and 20 per cent of yttrium —*Holmium*, identified as a separate element by Soret (*C R*, xci p 378), has absorption bands in the visible part of the spectrum (6405, 5363, 4855 on Lecoq's map of chloride of erbium), and also a strongly marked ultra-violet absorption spectrum —*Thulium*, likewise first recognized by Soret, is band 6840 on Lecoq's drawing of chloride of erbium, and also possesses a band at 4645 Thalén has measured the bright line spectrum (*C R*, xci p 376, 1880) —*Scandium* is characterized by a bright line spectrum (Thalén, *C R*, xci p 48, 1880) —*Gadolinium* (Marignac's Yα) has a weak absorption spectrum in the ultra-violet and a characteristic phosphorescent spectrum (*Proc Roy Soc*, February 1886), but the latest researches of Crookes have rendered it probable that it is a mixture of several new elements (*Proc Roy Soc*, 10th June 1886) —The *mosandrium* of Lawrence Smith seems a mixture of gadolinium and terbium The *philippium* of De la Fontaine was a mixture of yttrium and terbium, and the latest *decipium* of the same chemist is probably holmium

Aluminium Group —The spectra of the metals belonging to this group can be obtained in the ordinary way by means of the electric spark The chloride of indium shows the two strongest metallic lines, one in the indigo and one in the violet, when introduced into the Bunsen flame According to Claydon and Heycock, a number of other lines appear when the spark is taken from the metal electrodes When a weak spark is taken from aluminium electrodes in air a band spectrum is often seen belonging apparently to the oxide, for it disappears when the spark is taken in hydrogen Gallium, another metal belonging to this group, was first discovered by means of its spectroscopic reaction The chloride shows two violet lines feebly in the Bunsen flame, but strongly if a spark is taken from the liquid solution The ultra-violet lines of indium and of aluminium have been photographed by Hartley and Adeney, as well as by Liveing and Dewar Some of the lines had been previously mapped by Cornu, whose researches extend furthest into the ultra-violet According to Stokes, aluminium shows lines more refrangible than those of any other metal, and the wave-lengths of their lines as measured by Cornu are for one double line 1934, 1929, and for another 1860, 1852

Metals of the Iron Group —The spectroscopic phenomena of this group are somewhat complicated The line spectra can be obtained either by taking sparks from the metal or from the solution of a salt, and also by placing the metal in the voltaic arc The lines are very numerous and very liable to alter in relative intensity under different circumstances The great difference shown, for instance, between the arc and spark spectra of iron in the ultra-violet region is shown in the map by Liveing and Dewar in *Phil Trans*, 1885, pt i The visible part has also been investigated by the same authors and by Lockyer, and much information has thus been added to the knowledge previously obtained by Kirchhoff, Ångström, and Thalén That part of the iron spectrum lying between a wave-length of 4071 and 2947 has been mapped by Cornu, Liveing and Dewar's observations refer chiefly to the more refrangible region Considering the very important part which the iron spectrum plays in solar observations, a full investigation of its changes by a variation of temperature would at the present time be of great value If observations with the method adopted by Lecoq de Boisbaudran were repeated with higher resolving powers they would add much to our knowledge Some of the manganese salts, such as the chloride or carbonate, seem to be the only salts belonging to this group which show a characteristic spectrum when heated in the Bunsen burner or the oxyhydrogen flame The spectrum observed in these cases is, according to Watts, the characteristic spectrum of the Bessemer flame, which disappears at the right moment for stopping the blast, it is probably due to an oxide of manganese When a spark spectrum is taken from a solution of the chloride the same spectrum is seen, but the relative intensity of the lines depends on the length and the strength of the spark The green-coloured manganates show a continuous absorption at the two ends of the spectrum, transmitting in concentrated solutions almost exclusively the green part of the spectrum The absorption bands of permanganate of potassium are well known and seem to be due to the permanganic acid, as they appear also with other permanganates The green salts of nickel show a continuous absorption at the two ends of the spectrum The cobalt salts show well-defined absorption bands Their careful investigation by Dr W J Russell deserves special notice (*Proc Roy Soc*, xxxii p 258, 1881)

Metals of Chromium Group —The metallic spectra of this group have been measured principally by Thalen in the usual way Lockyer and Roberts have obtained a channelled spectrum of chromium by absorption As regards the spectra of compounds of chromium, the absorption of the vapour of chloro chromic anhydride has been measured by Emerson and Reynolds (*Phil Mag*, xlii p 41, 1871), and consists of a series of regularly distributed bands The chromium salts all possess a decided colour and show interesting absorption phenomena The chromates absorb the violet and blue completely, also the extreme red, and transmit only the orange, yellow, and in dilute solutions part of the green The most complete investigation of the salts in which chromium plays the part of a base is due to Erhard in a dissertation published at Freiburg Potassium chrom alum, ammonia chrom-alum, sulphate of chromium, when in solution, give an identical absorption for the same amount of chromium The extreme red is freely transmitted by the violet solution, but the absorption grows rapidly towards the yellow An indistinct absorption band ($\lambda=6790$ to $\lambda=6740$) is seen when the layer is thick or the solution concentrated The strongest absorption takes place for a wave length of 5800 The green is transmitted again more freely, the minimum absorption taking place for a wave-length 4880, the absorption then grows rapidly towards the violet When the solutions are heated the colour changes to green, the absorption is increased throughout the spectrum, except in the green, where it remains nearly unchanged, and the minimum of absorption shifts to a wave-length of 5090 The solution, which remains green on cooling, has, when compared with its original state, an increased absorption in the red and blue and a slightly diminished absorption in the green When light is sent through plates cut out of crystals of potassium chrom-alum or ammonia chrom-alum, three absorption bands (6860, 6700, 6620) are seen in the red The green and blue show the same absorption as the solution The chloride in solution gives the same absorption as the chrom alums,—transmitting, however, slightly more light for the same quantity of chromium The hot solution also shows the same changes, but with this difference that colour and absorption phenomena are almost entirely recovered on cooling The nitrate (solution of chromic hydroxide in nitric acid) agrees with chrom-alum, but transmits more light Red crystals of potassic chromic oxalate only transmit the red with an absorption band slightly less refrangible than B ($\lambda=6867$) The blue salt has the absorption band at a wave length of 7040 and transmits part of the light in the green and blue The solutions of the salts show the same absorption as the crystals, with the position of the absorption band apparently unchanged The warm solutions absorb more than the cold ones The oxalate of chromium gives an absorption band of 6910 to 6860 and transmits the green and blue more freely than the double salt The tartrate only shows the absorption band in the red very weakly and absorbs more red than the previously mentioned solutions The acetate transmits more yellow than the other salts and has some broad absorption bands near a wave-length of 7170 When the solution is heated it becomes green, absorbing the red more than when cold, but leaving the green and blue absorption unchanged The absorption phenomena shown by uranium salts are more complicated than those of the chromium salts, but they are at the same time more characteristic, as the spectra are more definitely broken up into bands According to Vogel, the uranic and uranous salts behave differently (*Praktische Spectral-Analyse*, p 247), but a more careful investigation is desirable Sorby finds that a mixture of zirconium and uranium dissolved in a borax bead shows characteristic bands, which are visible neither with uranium nor with zirconium alone

There is little to be said as regards the remaining groups of metals (tin, antimony, gold) Their spectra are best obtained by taking the spark from metallic electrodes or by volatilization in the voltaic arc

Influence of Temperature and Pressure on Spectra of Gases

If the spectrum of an element is examined under different conditions of temperature or pressure, it is often found to differ considerably The change may be small—that is to say, the lines or bands may only show a different distribution of relative intensity—or it may be so large that no relationship at all can be discovered between the spectra It has been pointed out by Kirchhoff that a change in the thickness of the luminous layer may produce a change in the appearance of the spectrum, and Zollner and Wullner have endeavoured to explain in this way a number of important variations of spectra But their explanation does not stand the test of close examination The thickness of layer cannot be neglected in the discussion of solar and stellar spectra, or in the comparison of absorption spectra of liquids, but none of the phenomena which we shall notice here are affected by it

Widening of Lines —The lines of a spectrum are found to widen under certain conditions, and, although probably all spectra are subject to this change, some are much more affected by it than

others The lines of hydrogen and sodium, for instance, widen so easily that it is sometimes difficult to obtain them quite sharp When a system of lines widens it is generally found that the most refrangible lines widen most easily A line may expand equally towards both sides or chiefly towards one side, in the latter case the expansion towards the less refrangible side preponderates pretty nearly in every case It is the almost unanimous opinion of spectroscopists that the widening is produced by an increase of pressure If sparks are passed through gases, the lines are always broader at high than at low pressures, and the metallic lines are also broader when a spark is taken from them at higher pressures Without altering the pressure, we may often produce a widening of lines by an increase in the intensity of the discharge, but here the pressure is indirectly increased by the rise of temperature According to the molecular theory of gases, the following explanation might be given for the widening of lines As long as a molecule vibrates by itself uninfluenced by any other molecule, its vibrations will take place in regular periods The lines of its spectrum will consequently be sharp But, if the molecule is placed in proximity with others, its vibrations will be disturbed by occasional encounters During each encounter forces may be supposed to act between the molecules, and these forces will affect the regularity of the vibration The question arises, whether for a given temperature and pressure a line may be of different width according as the molecule is placed in an atmosphere of similar or dissimilar molecules Such a difference exists in all probability If gases are mixed in different proportions, the lines are sharper when an element is present in small quantities, although the total pressure may be the same There is one cause which limits the sharpness of spectroscopic lines the molecules of a gas have a translatory motion Those molecules which are moving towards us will send us light which is slightly more refrangible than those which move away from us, hence each line ought to appear as a band In reality the width of lines generally is greater than that due to this cause

Spectra of Different Orders —Spectra may be classified according to their general appearance The different classes have been called orders by Plucker and Hittorf At the highest temperature we always obtain spectra of lines which need no further description At a lower temperature we often get spectra of channelled spaces or fluted bands When seen in spectroscopes of small resolving power these seem made of bands which have a sharp boundary on one side and gradually fade away on the other With the help of more perfect instruments it is found that each band is made up of a number of lines which lie closer and closer together as the sharp edge is approached Occasionally the bands do not present a sharp edge at all, but are made up of a number of lines of equal intensity at nearly equal distances from each other Continuous spectra, which need not necessarily extend through the whole range of the spectrum, form a third order, and appear generally at a lower temperature than either band or line spectrum One and the same element may at different temperatures possess spectra of different orders A discussion has naturally arisen as to the cause of these remarkable changes of spectra, and it is generally believed that they are due to differences of molecular structure Thus sulphur vapour when volatilized shows by absorption a continuous spectrum until its temperature is raised to 1000°, when the continuous spectrum gives way to a spectrum of bands We know that the molecule of sulphur is decomposed as the temperature is raised, and we are thus justified in saying that the band spectrum belongs to the molecule containing two atoms, while the continuous spectrum belongs to the more complex molecule which first appears on volatilization When a strong electric spark is passed through the vapour of sulphur a bright line spectrum is seen, and this is believed to be due to a further splitting up of the molecule into single atoms

Long and Short Lines —If the spectrum of a metal is taken by passing the spark between two poles in air the pressure of which is made to vary, the relative intensity of some of the lines is often seen to change Similar variations take place if the intensity of the discharge is altered, as, for instance, by interposing or taking out a Leyden jar It is a matter of importance to be able to use a method which in the great majority of cases will give at once a sure indication how each line will behave under different circumstances This method we now proceed to describe It has often been remarked, even by the earliest observers, that the metallic lines when seen in a spectroscope do not always stretch across the field of view, but are sometimes confined to the neighbourhood of the metallic poles Some observations which Lockyer made jointly with Professor Frankland led him to conclude that the distance which each metallic line stretched away from the pole could give some clue to the behaviour of that line in the sun In 1872 Lockyer worked out his idea An image of the spark was formed on the slit of the spectroscope, so that the spectrum of each section of the spark could be examined Some of the metallic lines were then seen to be confined altogether to the neighbourhood of the poles, while others stretched nearly across the whole field The relative length of all the lines was estimated Tables and maps are added to the memoir [1] The longest lines (that is, those which stretch away farthest from the pole) are by no means always the strongest, and there are many instances where a faint line is seen to stretch nearly across the whole field of view, while a strong line may be confined to the neighbourhood of the pole, or is reduced sometimes to a brilliant point only We give a few conspicuous examples of lines which are long and weak or short and strong In lithium the blue line (4602 7) is brilliant but short In lead 4062 5, one of the longest lines, is faint and according to Lockyer difficult to observe In tin 5630 0 is the longest line, but it is faint, while the stronger lines near it (5588 5 and 5562 5) are shorter The zinc lines 4923 8, 4911 2, 4809 7, 4721 4, 4679 5 are given by Thalén as of equal intensity, but the three most refrangible ones are longer On reduction of pressure Lockyer found that some of the shorter lines rapidly decreased in length, while the longer lines remained visible and were sometimes hardly affected When the spark was taken from a metallic salt instead of from the metal the short lines could not be seen, but only the long lines remained An alloy behaves in the same manner as a compound, and by gradually reducing one constituent of an alloy we may gradually reduce the number of lines, which disappear in the inverse order of their length Subsequent work has shown that the longest lines are also generally those which are most persistent on reduction of temperature, so that in the voltaic arc the longest lines seen in the spark are absent In order to explain these facts it seems necessary in the first place to assume that the short lines are lines coming out at a high temperature only, but this explanation is not sufficient Why should a mixture of different elements only show the longest lines of that constituent which is present in small quantities? In the case of chemical combinations we might assume that, the spark having to do the work of decomposition, the temperature of the metal is lowered, and that therefore the short lines are absent But this cannot be if a chemical compound is replaced by a mechanical mixture All these facts would be explained, however, if we assume that the spectrum of a molecule that is excited by molecules of another kind consists of those lines chiefly which a molecule of the same kind is already capable of bringing out at a lower temperature It would follow from this that the effects of dilution are the same as those of a reduction of temperature,—which is the case.

Other Changes in Relative Intensity of Lines. — Besides the changes we have noticed, there are others which have not been brought under any rule as yet Lines appear sometimes at a low temperature which behave differently from the proper low-temperature lines These require further investigation They may, in some cases at least, be due to some compound of the metal with other elements present We give some examples If a spark is taken from lead without the condenser the line 5005 appears, and Huggins has found it to be sensibly coincident with the chief line of the nebulæ It is given as a strong line by Lecoq de Boisbaudran, who used feeble sparks, and in many cases it seems to behave as a low temperature line, it ought to be a long line therefore, but it is in reality short In line 6100 of tin, Salet noticed that when a hydrogen flame contains a compound of tin an orange line appears, which is apparently coincident with the orange line of lithium This line does not figure on any of the maps of the tin spectrum. Lockyer found that zinc, volatilized in an iron tube, showed by absorption a green line It is very likely the line 5184 seen by Lecoq de Boisbaudran in sparks taken from solution of zinc salts In the absorption spectra of sodium and potassium lines appear in the green which were shown by Liveing and Dewar not to be coincident with any known line of these metals It was suggested by them that they are due to hydrogen compounds. The wave-length of the sodium line is 5510 and that of the potassium line 5730 Lecoq de Boisbaudran mentions that an increase of temperature is often accompanied by a relatively greater increase in the brilliancy of the more refrangible rays It is often said that such an increase is a direct consequence of the formula established by Kirchhoff If the absorbing power of a molecule remains the same while the temperature is increased, it follows that the blue rays gain more quickly in intensity than the red ones, but the less refrangible rays ought never to decrease in intensity, the quantity of luminous matter remaining the same Now such a decrease is actually observed in many cases when there is no reason to suppose that the quantity of luminous matter has been reduced We must conclude, therefore, that the observed differences in the spectra are not solely regulated by Kirchhoff's law, but it is a perfectly plausible hypothesis that a higher temperature is in general accompanied by a decrease in the absorbing power of the less refrangible rays As a stronger impact often brings out higher tones, stronger molecular shocks may bring out waves of smaller length There are several instances of a regular increase in the relative intensity of the blue rays which may be ascribed to this cause The most remarkable instance is perhaps seen in the spec-

[1] *Phil Trans*, clxiii p 253 (1873)

trum of phosphoretted hydrogen If a little phosphorus is introduced into an apparatus generating hydrogen, the flame will show a series of bands chiefly in the green The spectrum gets more brilliant if the flame is cooled This can be done, according to Salet,[1] by pressing the flame against a surface kept cool by means of a stream of water or by surrounding the tube, at the orifice of which the gas is lighted, by a wider tube through which cold air is blown The process of cooling the flame, according to Lecoq,[2] changes the relative intensity of the bands in a perfectly regular manner The almost invisible least refrangible band becomes strong, and the second band, which was weaker than the fourth, now becomes stronger Another example of a similar change is the spectrum shown by a Bunsen burner By charging the burner with an indifferent gas[3] (N, HCl, CO_2) the flame takes a greenish colour, and, though the spectrum is not altered, the least refrangible of the bands are increased in intensity While in these instances the changes are perfectly regular, the more refrangible rays gaining in relative intensity as the temperature is increased, there are other cases, some of which have already been mentioned, in which the changes are very irregular, such are those which take place in the spectra of tin, lithium, and magnesium In the case of zinc the less refrangible of the group of blue rays gains in relative intensity We cannot, therefore, formulate any general law

Numerical Relations between the Wave lengths of Lines belonging to the Spectrum of a Body

It seems *a priori* probable that there is a numerical relation between the different periods of the same vibrating system In certain sounding systems, as an organ-pipe or a stretched string, the relation is a simple one, these periods being a submultiple of one which is called the fundamental period The harmony of a compound sound depends on the fact that the different times of vibration are in the ratio of small integer numbers, and hence two vibrations are said to be in harmonic relation when their periods are in the ratio of integers We may with advantage extend the expression "harmonic relation" to the case of light, although the so-called harmony of colours has nothing to do with such connexions We shall therefore define an "harmonic relation" between different lines of a spectrum to be a relation such that the wave-lengths or wave numbers are in the ratio of integers, the integers being sufficiently small to suggest a real connexion Some writers use the word in a wider sense and call a group of lines harmonics when they show a certain regularity in their disposition, giving evidence of some law, that law not being in general the harmonic law We shall here use the expression in its stricter sense only We begin by discussing the question whether there are any well-ascertained cases of harmonic relationship between the different vibrations of the same molecule The most important set of lines exhibiting such a relationship are three of the hydrogen lines which, when properly corrected for atmospheric refraction, are, as pointed out by Johnstone Stoney, very accurately in the ratio of 20 27 32 (*Phil Mag*, xli p 291, 1871) Other elements also show such ratios, but when a spectrum has many lines pure accident will cause several to exhibit whatever numerical relations we may wish to impose on them If we calculate the number of harmonic ratios which, with an assumed limit of accuracy, we may expect in a spectrum like that of iron, we find that there are in reality fewer than we should have if they were distributed quite at random (*Proc Roy Soc*, xxxi p 337, 1881) With fractions having a denominator smaller than seventy the excess of the calculated over the observed values is very marked, while there are rather more coincidences than we should expect on the theory of probability if we take fractions having a denominator between seventy and a hundred The cause of this, probably, is to be sought in the fact that the lines of an element are liable to form groups and are not spread over the whole spectrum, as they would be if they were distributed at random This increases the probability of coincidence with fractions between high numbers, and diminishes the probability of coincidence with fractions between lower numbers There is one point which deserves renewed investigation When the limits of agreement between which a coincidence is assumed to exist are taken narrower, there is an increased number of observed as compared with calculated coincidences in the iron spectrum, and this would seem to point to the existence of some true harmonic ratios With the solar maps and gratings put at our disposal by Professor Rowland, we may hope to obtain more accurate measurements, and therefore more definite information Even if the wave-lengths of two lines are found to be occasionally in the ratio of small integer numbers, it does not follow that the vibrations of molecules are regulated by the same laws as those of an organ-pipe or of a stretched string E J Balmer[4] has indeed lately suggested a law which differs in an important manner from the laws of vibration of the organ-pipe and which still leaves the ratios of the periods of vibration integer numbers According to him, the hydrogen spectrum can be represented by the equation

$$\frac{m^2}{m^2-4}\lambda_0=\lambda,$$

where λ_0 is some wave-length and m an integer number greater than 2 The following table (I) shows the agreement between the calculated and observed hydrogen lines And the agreement is a very remarkable one, for the whole of the hydrogen spectrum is represented by giving to m successive integer values up to sixteen

$\lambda_0=3645$		Observed Hydrogen Spectrum	$\lambda_0=3645$		Observed Hydrogen Spectrum
m	$m^2\lambda_0/(m^2-4)$		m	$m^2\lambda_0/(m^2-4)$	
3	6561 0	6562 1	10	3796 9	3795 0

The differences between the observed and the calculated numbers show a regular increase towards the ultra-violet It might be thought that a better agreement could be obtained by taking a number slightly different from four in the denominator, but this is not the case On the contrary, the agreement in the visible part is at once destroyed if we make the ultra-violet lines fit better The agreement is not improved but rendered slightly worse if we take account of atmospheric refraction

As a first approximation Balmer's expression gives a very good account of the hydrogen spectrum If the law was general we should find that in the iron spectrum, for instance, which is the only spectrum carefully examined, those fractions would occur more frequently than others which can be put into the form $m^2/(m^2-n^2)$, that is to say, $\frac{9}{5}$ and $\frac{4}{3}$ for fractions made up of numbers smaller than 10 A reference to the table in *Proc Roy Soc*, vol xxxi p 337, shows that these fractions do not occur more frequently than others But, if we change the sign of n^2 in the denominator, we find $\frac{4}{5}$ and $\frac{9}{13}$ as the only fractions falling within the range of spectrum examined, and these two fractions are indeed those which occur more frequently than any others made up of numbers smaller than 10

It might be worth trying to see whether the wave-lengths of lines making up a fluted band can be put into the form $\frac{m^2}{m^2 \pm n^2}\lambda_0$, according to the sign chosen in the denominator, the band would shade off towards the blue or red The form of expression seems at first sight well adapted, for it shows how by giving m gradually increasing numbers the lines come closer and closer together towards what appears in the spectrum as the sharp edge of the band If we take periods of vibration instead of wave-lengths Balmer's expression would reduce to

$$T=T_0\left[1-\left(\frac{n}{m}\right)^2\right],$$

where T_0 is a fixed period of vibration, n a constant integer, and m an integer to which successive values are given from n upwards

It is often observed, and has already been mentioned, that the spectrum of some elements contains in close proximity two or three lines forming a characteristic group Such doublets or triplets are often repeated, and if the harmonic law was a general one we should expect the wave-lengths of these groups to be ruled by it, but such is not the case. The sodium lines which lie in the visible part of the spectrum are all double, the components being the closer together the more refrangible the group But neither are the lines themselves in any simple ratios of integers, nor do the distances between the lines show much regularity The ultra-violet lines of sodium as photographed by Liveing and Dewar are single, with the exception of the least refrangible of them (3301) But this line is a very close double, and it may be that the others will ultimately be resolved Some elements, such as magnesium, calcium, zinc, cadmium, show remarkable series of triplets, and the relative distances of the three lines seem well maintained in each of them Even the distances when mapped on the wave-number scale are so nearly the same for each element that it would be a matter of great importance to settle definitively whether the slight variations which are found to exist are real or due to errors of measurement In the following table (II) we give the position of the least refrangible line of each triplet together with the distances between the first and second (column B) and between the second and third line of each triplet (column C) The figures in column A represent the number of waves in one millimetre For the zinc and calcium triplets the measurements of Liveing and Dewar are given, the magnesium triplets are put down as measured by Cornu as well as by Hartley and Adeney The differences in these measurements will give an idea of the degree of uncertainty The triplets of cadmium are farther apart and are mixed up with a greater number of single lines

Relation between Spectrum of a Body and Spectra of its Compounds

The spectrum of a body is due to periodic motion within the molecules If we are justified in believing that the molecule of mercury vapour contains a single atom, it follows that atoms are capable of vibration under the action of internal forces, for mercury vapour has a definite spectrum We may consider, then, the spectrum to be determined in the first place by forces within the atom, but to be affected by the forces which hold together the different atoms within the molecule The closer the bond of union the greater the dependence of the vibrations on the forces acting between the different atoms Experimental evidence seems to favour these views, for we observe that whenever elements are loosely bound together we can recognize the influence of each constituent, while in the compounds which are sufficiently stable to resist the temperature of incandescence the spectrum of the compound is perfectly distinct from the spectra of the elements The oxides and haloid salts of the alkaline earths, for instance, have spectra in which we cannot trace the vibrations of the component atoms, but the spectra of the different salts of the same metal show a great resemblance, the bands being similar and similarly placed The spectrum seems displaced towards the red as the atomic weight of the haloid increases No satisfactory numerical relationship has, however, been traced between the bands The number of compounds which will endure incandescence without decomposition is very small, and this renders an exhaustive investigation of the relationship between their spectra very difficult

The compounds whose absorption spectra have been investigated have often been of a more unstable nature, and, moreover, dissociation seems going on in liquid solutions to a large extent, the influence of the component radicals in the molecule is more marked in consequence Dr Gladstone,[3] at an early period in the history of spectrum analysis, examined the absorption spectra of the solution of salts, each constituent of which was coloured He concluded that generally, but not invariably, the following law held good "When an acid and a base combine each of which has a different influence on the rays of light a solution of the resulting salt will transmit only those rays which are not absorbed by either, or, in other words, which are transmitted by both" He mentions as an important exception the case of ferric ferro-cyanide, which, when dissolved in oxalic acid, transmits blue rays in great abundance, though the same rays are absorbed both by ferro-cyanides and by ferric salts Soret has confirmed, for the ultra-violet rays, Dr Gladstone's conclusions with regard to the identity of the absorption spectra of different chromates The chromates of sodium, potassium, and ammonia, as well as the bichromates of potassium and ammonia, were found to give the same absorption spectrum Nor is the effect of these chromates confined to the blocking out simply of one end of the spectrum, as in the visible part, but two distinct absorption bands are seen, which seem unchanged in position if one of the above-mentioned chromates is replaced by another Chromic acid itself showed the bands, but less distinctly, and Soret does not consider the purity of the acid sufficiently proved to allow him to draw any certain conclusion from this observation Erhard's work on the absorption spectra of the salts in which chromium plays the part of base has already been mentioned Nitric acid and the nitrates of transparent bases, such as potassium, sodium, and ammonia, show spectra, according to Soret, which are not only qualitatively but also quantitatively identical, that is to say, a given quantity of nitric acid in solution gives a characteristic absorption band of exactly the same width and darkness, whether by itself alone or combined with a transparent base It also shows a continuous absorption at the most refrangible side, beginning with each of the salts mentioned at exactly the same point The ethereal nitrates, however, give different results In 1872 Hartley and Huntington examined by photographic methods the absorption spectra of a great number of organic compounds The normal alcohols were found to be transparent to the ultra-violet rays, the normal fatty acids less so In both cases an increased number of carbon atoms increases the absorption at the most refrangible end The fact that benzene and its derivatives are remarkable for their powerful absorption of the most refrangible rays, and for some characteristic absorption bands appearing on dilution, led Hartley to a more extended examination of some of the more complicated organic substances He determined that definite absorption bands are only produced by substances in which three pairs of carbon atoms are doubly linked together, as in the benzene ring More recently[4] he has subjected the ultra-violet absorption of the alkaloids to a careful investigation, and has arrived at the conclusion that the spectra are sufficiently characteristic to "offer a ready and valuable means of ascertaining the purity of the alkaloids and particularly of establishing their identity" "In comparing the spectra of substances of similar constitution it is observed that in such as are derived from bases by the substitution of an alkyl radical for hydrogen, or of an acid radical for hydroxyl, the curve is not altered in character, but may vary in length when equal weights are examined This is explained by the absorption bands being caused by the compactness of structure of the nucleus of the molecule, and that equal weights are not molecular weights, so that by substituting for the hydrogen of the nucleus radicals which exert no selective absorption the result is a reduction in the absorptive power of a given weight of the substance Bases which contain oxydized radicals, as hydroxyl, methoxyl, and carboxyl, increase in absorptive power in proportion to the amount of oxygen they contain"

It would seem, however, by comparing the above results with those obtained by Captain Abney and Colonel Festing[5] that the absorption of a great number of organic substances is more characteristic in the infra-red than in the ultra violet Some of the conclusions arrived at by these experimentalists are of great importance, as the following quotations will show —"Regarding the general absorption we have nothing very noteworthy to remark, beyond the fact that, as a rule, in the hydrocarbons of the same series those of heavier molecular constitution seem to have less than those of lighter" This effect agrees with the observations made by Hartley and Huntington in the ultra-violet, in so far as a general shifting of the absorption towards the red seems to take place as the number of carbon atoms is increased Such a shifting would increase the general absorption in the ultra-violet as observed by Hartley and Huntington, and decrease it in the infra-red as observed by Abney and Festing Turning their attention next to the sharply defined lines, the last named, by a series of systematic experiments, concluded that these must be due to the hydrogen atoms in the molecule "A crucial test was to observe spectra containing hydrogen and chlorine, hydrogen and oxygen, and hydrogen and nitrogen We therefore tried hydrochloric acid and obtained a spectrum containing some few lines Water gave lines, together with bands, two lines being coincident with those in the spectrum of hydrochloric acid In ammonia, nitric acid, and sulphuric acid we also obtained sharply marked lines, coincidences in the different spectra being observed, and nearly every line mapped found its analogue in the chloroform spectrum, and usually in that of ethyl iodide Benzene, again, gave a spectrum consisting principally of lines, and these were coincident with some lines also to be found in chloroform It seems, then, that the hydrogen, which is common to all these different compounds, must be the cause of the linear spectrum In what manner the hydrogen annihilates the waves of radiation at these particular points is a question which is, at present at all events, an open one, but, that the linear absorptions, common to the hydrocarbons and to those bodies in which hydrogen is in combination with other elements, such as oxygen and nitrogen, are due to hydrogen, there can be no manner of doubt The next point that required solution was the effect of the presence of oxygen on the body under examination It appears that in every case where oxygen is present, otherwise than as a part of the radical, it is attached to some hydrogen atom in such a way that

[1] Measured by Thalén [2] Measured by Liveing and Dewar [3] *Phil Mag*, xiv p 418 (1857)

[4] *Phil Trans*, part ii (1885) [5] *Phil. Trans*, iii p 887 (1881)

it obliterates the radiation between two of the lines which are due to that hydrogen If more than one hydroxyl group be present, we doubt if any direct effect is produced beyond that produced by one hydroxyl group, except a possible greater general absorption, a good example of this will be found in cinnamic alcohol and phenylpropyl alcohol, which give the same spectra as far as the special absorptions are concerned Hitherto we have only taken into account oxygen which is not contained in the radical, when it is so contained it appears to act differently, always supposing hydrogen to be present as well We need only refer to the spectrum of aldehyde, which is inclined to be linear rather than banded, or rather the bands are bounded by absolute lines, and are more defined than when oxygen is more loosely bonded"

"An inspection of our maps will show that the radical of a body is represented by certain well-marked bands, some differing in position according as it is bonded with hydrogen, or a halogen, or with carbon, oxygen, or nitrogen There seem to be characteristic bands, however, of any one series of radicals between 1000 and about 1100, which would indicate what may be called the central hydrocarbon group, to which other radicals may be bonded The clue to the composition of a body, however, would seem to lie between λ 700 and λ 1000 Certain radicals have a distinctive absorption about λ 700 together with others about λ 900, and if the first be visible it almost follows that the distinctive mark of the radical with which it is connected will be found Thus in the ethyl series we find an absorption at 740, and a characteristic band, one edge of which is at 892 and the other at 920 If we find a body containing the 740 absorption and a band with the most refrangible edge commencing at 892, or with the least refrangible edge terminating at 920, we may be pretty sure that we have an ethyl radical present So with any of the aromatic group, the crucial line is at 867 If that line be connected with a band we may feel certain that some derivative of benzine is present The benzyl group show this remarkably well, since we see that phenyl is present, as is also methyl It will be advantageous if the spectra of ammonia, benzine, aniline, and dimethyl aniline be compared, when the remarkable coincidences will at once become apparent, as also the different weighting of the molecule The spectrum of nitro-benzine is also worth comparing with benzine and nitric acid In our own minds there lingers no doubt as to the easy detection of any radical which we have examined, and it seems highly probable by this delicate mode of analysis that the hypothetical position of any hydrogen which is replaced may be identified, a point which is of prime importance in organic chemistry The detection of the presence of chlorine or bromine or iodine in a compound is at present undecided, and it may well be that we may have to look for its effects in a different part of the spectrum The only trace we can find at present is in ethyl bromide, in which the radical band about 900 is curtailed in one wing The difference between amyl iodide and amyl bromide is not sufficiently marked to be of any value"

The absorption spectra of the didymium and cobalt salts afford many striking examples of the complicated effects of solution and combination in the spectra It is impossible to explain these without the help of illustrations, and we must refer the reader, therefore, to the original papers [1] Some very interesting changes have been noticed in the position of absorption bands when certain colouring matters are dissolved in different liquids Characteristic absorption bands appear for each colouring matter in slightly different positions according to the solvent Hagenbach, Kraus, Kundt,[2] and Claes[3] have studied the question In a preliminary examination Professor Kundt had come to the conclusion that solvents displaced absorption bands towards the red in the order of their dispersive powers, but the examination of a greater number of cases has led him to recognize that no generally valid rule can be laid down At the same time highly dispersive media, like bisulphide of carbon, always displace a band most towards the red end, while with liquids of small dispersion, like water, alcohol, and ether, the band always appears more refrangible than with other solvents, and as a general rule the order of displacement is approximately that of dispersive power

Relations of the Spectra of Different Elements

Various efforts have been made to connect together the spectra of different elements In these attempts it is generally assumed that certain lines in one spectrum correspond to certain lines in another spectrum, and the question is raised whether the atom with the higher atomic weight has its corresponding lines more or less refrangible No definite judgment can as yet be given as to the success of these efforts Lecoq de Boisbaudran has led the way in these speculations, and some of the similarities in different spectra pointed out by him are certainly of value But whether his conclusion, that "the spectra of the alkalis and alkaline earths when classed according to their refrangibilities are placed as their chemical properties in the order of their atomic weight," will stand the test of further research remains to be seen Ciamician[4] has also published a number of suggestive speculations on the question, and Hartley[5] has extended the comparison to the ultra-violet rays

When metallic spectra are examined it is often found that some line appears to belong to more than one metal This is often due to a common impurity of the metals, but such impurities do not account for all coincidences The question has been raised whether these coincidences do not point to a common constituent in the different elements which show the same line If this view is correct, we should have to assume that the electric spark decomposes the metals, and that the spectrum we observe is not the spectrum of the metal but that of its constituents Further investigation has shown, however, that in nearly all cases the assumed coincidences were apparent only With higher resolving powers it was found that the lines did not occupy exactly the same place With the large numbers of lines shown by the spectra of most of the metals some very close coincidences must be expected by the doctrine of chances The few coincidences which our most powerful spectroscopes have not been able to resolve are in all probability accidental only (A S*)

SPEECH-SOUNDS, the sounds actually used for the conveyance of thought by speech See PHONETICS

1 *Symbolization*—It is necessary to have some system of writing speech-sounds, in order to talk of them The system used in the present article is the palaeotype of the present writer's *Early English Pronunciation* All letters or words thus written will be enclosed in () The following preliminary list of the ordinary sounds, with examples, will render what follows intelligible For an alphabetical list, see art 20

English—1 b*ee*t b*ai*t b*aa* b*ough*t b*oa*t b*oo*t (biit beet baa bAAt boot buut) 2 kn*i*t n*e*t gn*a*t kn*o*t n*u*t n*oo*k (nit net næt nɔt nət nuk) 3 f*i*le f*oi*l f*ow*l f*ue*l (fa'il fɔ'il fa'ul fiuu il) 4 *h*ay (hee) 5 *p*ea *b*ee, *t*oe *d*oe, *c*ape *g*ape (pii bii, too doo, keep geep) 6 *wh*ey *w*ay, *f*eel *v*eal, *th*in *th*en, *s*eal *z*eal, *r*ush *r*ouge, *h*ue *y*ou (whee wee, fiil viil, thin dhen, siil ziil, rəsh ruuzh, jhiuu juu) 7 ea*r* *r*ing, gu*ll* litt*le* (iir riq, gəl lit'l) 8 su*m* chas*m*, su*n* ope*n*, su*ng* (səm kæz'm, sən oop'n, səq) 9 *ch*est *j*est (tjest djest)

Foreign—F French, G German, IT Italian 10 b*ê*te F, l*â*che F, n*ò* IT, d*û* F, f*eu* F, v*eu*f F, v*in* F, v*en*t F, v*on*t F, *un* F, s*oin* F, s*oi* F, l*ui* F (bEEt, laash, no, dyy, fə, vœf, veA, vaA, voA, œA, süeA, süa, lyi) 11 da*ch* tei*ch*, ta*g*e sie*g*e, *w*ahl, all G (,dakh ,taikjh, ,taaghe, zughe, bhaal) 12 pa*gl*ia IT, beso*gn*e F (pà lja, bəzonj)

2 *Nature of Speech-Sounds*—Speech-sounds result from shocks given to the air by the organs of speech, received by the drumskin of the ear, and transmitted to the auditory nerves in the cochlea The apparatus is explained by Helmholtz, who deals with musical sounds But speech is not musical, and its sounds are much obliterated when rendered musical[6] An original quality of tone generated by the vocal chords is modified by the cavities through which it passes, as explained by Helmholtz (*Sensations of Tone*) on the principle of resonance There are three ways in which speech-sounds may be produced—(1) by the air in the mouth, without additional breathing, by smacks and clicks, (2) by drawing in air, as orally in chirps, whistles, sobs, gasps, and nasally in snuffles, snores, (3) by expelling air, as in the greater number of speech-sounds The last are

[4] *Wien Ber*, lxxviii (1878)
[5] *Journal Chem Soc*, September 1883
[6] Ellis, *Speech in Song*, sect iv

either *flated*, the vocal chords being wide apart and hence not vibrating, but allowing breath to pass freely, or *voiced*, the vocal chords being close together and vibrating fully, or else *whispered*, the vocal chords approximating but not touching, and their edges only vibrating The last is only a variation of the second and needs no further consideration Flated and voiced sounds are either *fixed*, the position of the vocal organs remaining unchanged throughout, or *changing*, the position constantly altering from one fixed position to another, forming "glides"

3 *Generic and Specific Speech-Sounds*—Fixed speech-sounds, intended to be the same, vary from speaker to speaker, and in the same speaker at different times Those who attempt to write sounds from dictation rapidly find that they have to disregard these specific differences, and simply discriminate genera And much difference of opinion has always existed as to the discrimination and number of genera

4 *Vowels*, that is, *vocals*, are so called because their positions allow the voice-sounds to pass with least obstruction The three genera (ii, aa, uu), which have always been distinguished, differ greatly in the positions of the tongue and lip, that is, in their mouth cavities, and hence resonance The usual method of describing speech-sounds is by the shape of the cavity, which, however, could be shown to be insufficient for many reasons As differently shaped cavities resound to a note of the same pitch, Helmholtz proposed the last for discrimination The pitches of (ii, aa, uu) are widely different, (ii) having the highest and (uu) the lowest, but the extreme diversity of results in attempting to assign the actual pitch of vowel cavities shows that this will not suffice Resonance cavities do not create but merely modify original vowel qualities of tone, and these last seem to depend upon the will of the speaker, guided by his powers of appreciation and imitation, both extremely variable, partly hereditary, partly depending on conformation of brain, and partly acquired during adolescence

Melville Bell, Sweet, Storm, and Sievers, and all who have latterly examined the subject distinguish at least two series of vowel genera, that is, two forms of each genus, called "narrow" and "wide", but they are far from being agreed as to what the difference consists in and how it is produced Sweet differs from Bell, and Sievers does not wholly agree with Sweet All, however, call (ii, uu) narrow, and (*i*, *u*) wide

Besides these two series Bell introduced another distinction applying to both, termed "rounding," consisting in a greater or less closure of the lips, slight for (AA), much for (uu), and intermediate for (*oo*) But this character is not scientifically precise, because all the vowels can be produced with the mouth wide open (by means of a compression of the arches of the palate), and still more easily with the mouth at least as much closed as ordinarily for (uu) Other phonetists wish to introduce distinctions based upon the shape of the apertures between the lips

There is also a feeling of intermediateness between vowel-sounds Thus (yy) is felt by many to lie "between" (ii, uu), and (œœ) between (*oo*, *ee*) But we also have other intermediates which arise spontaneously when listening to new languages and dialects Thus in west Somerset there is a vowel between (ə, i), one between (y, ə), and another between (ə, œ), and the positions for these vowels have not been ascertained These are only specimens of numerous cases Hence the positional discrimination breaks down at present Nevertheless it is very good so far as it goes, but must not be pressed to extremes

All the vowels may be also flated and whispered, that is, the position and dictating vowel-intention remaining, the totally or partially open vocal chords forbid voice and produce sound more or less recognized as substitutes for the true vowels Write (ii) voiced, ('ii) whispered, (''ii) flated This distinction becomes of more importance for consonants

5 *Glottids and Physems*—A *glottid* is the action of the vocal chords in altering the form of the *glottis* or tongue-shaped space between them (1) The glottid is *clear* when there is no attempt to utter the vowel until the chords are brought together, yet the utterance takes place at that instant This may be written (,ii) initial Similarly, a vowel may end with a clear glottid (,ii,), no flatus escaping after the vowel ceases This clear glottid is usually inferred and not written (2) The glottid is *gradual*, written (ꞁ), when flatus passes through the vowel position before the chords are sufficiently approximated for voice, or after they are separated, thus (ꞁiiꞁ) is really (''ii + 'ii + ii + 'ii + ''ii) This is an exceedingly common habit with some speakers (3) The *check* glottid (;), Arabic *hamza* ء, arises from keeping the chords tightly closed so that they cannot vibrate, and then releasing them with an explosion It may be final in reverted order in Arabic, and it is common as an initial in German, as *;eine ;er;innerung*, and is used as the *catch* accent in Danish, as *ma;nd*, a man, distinct from *man* = F *on* (4) An exaggeration of (;) gives Arabic (ɛáin) ع, the bleat, with a rattle in the cartilaginous glottis

Physems are the bellows-actions of the lungs (1) The jerk (H) or sudden puff of either vocalized or flated breath, accompanying either clear or gradual glottid The first, with voice only, is the singer's and Bengali aspirate, the second, with flatus, is the Scotch or German aspirate (2) The *wheeze* (*h*), Arabic ح, stated by Czermak to arise from suddenly forcing breath through the cartilaginous glottis

6 *Vowel Glides and Vanishes*—So far the positions of the vowel above the larynx have been supposed to remain unchanged In this case many degrees of length may be distinguished, as (ă) very short, (a) short, (à) medium, (aa) long, (aà) drawled, (aaa) extravagantly prolonged If the vowel sign consists of two parts, as (ah), only the first is marked doubled or tripled for these lengths, as (ăh, aah), &c In English it is felt very difficult to preserve the positions for long (*ee*, aa, *oo*), and these vowels gravitate to, without by any means reaching, (i, e, u) The first and last may be written (*ee*'j, *oo*'*w*), implying what are termed *vanishes* or gliding alterations of sound, accompanied by alterations of position as the vowel ceases This change is generally unintended and mostly used unconsciously

7 *Diphthongs*—But there are conscious changes to quite different positions The first and last vowels are then taken as fixed, one of them having the chief stress, and there is a vowel glide between them These form *diphthongs*, the stress and glide being the chief characteristics are marked by ('), and the two elements are juxtaposed The glide is generally short and close in English, longer in German, still longer and looser, or "slurred," in French and Italian. There are many typical classes i With weak final (i), unanalysed (a'i), analysed (ái, *ái*, ə'*i*, ɪ'*i*, *éi*, éi, E'*i*, æ'*i*), &c, all common ii With weak final (u), unanalysed (a'u), analysed (áu, *áu*, ə'*u*, ɪ'*u*, *éu*, é*u*, E'*u*, æ'*u*), &c, all very common iii Weak final (y), theoretic German *eu* (óy, áy), Devonshire *ow* (œ'y_1[5]) iv Weak initial (i) or (ĭ), used for (j) in Italy, France, Wales, &c v Weak initial (y) in Fr vi Weak initial (u) or (ŭ), used for (w) in Italy, Spain, France, Wales, &c vii Murmur diphthongs ending in weak (ɐ), common in English, but generally with the option of trilling an (r) after it, and hence written (ɹ), as in *ear*, *air*, *oar*, *lord*, *poor*, *pure*, *pyre*, *power* (*i*ɹ, eeɹ, ooɹ, lAAɹd, puuɹ, pĭ*u*uɹ, pa'*i*ɹ, pa'uɹ); the *r* is always trilled in Scotland viii The vanish diphthongs

(*ee'*j, *oo'w*), just considered ix Inchoant diphthongs, first *grave*, where the speaker begins too low and corrects himself, as (*ii*, *úu*), and secondly *acute*, where he begins with the mouth too open and corrects himself as he proceeds, as (ɜ'*o*), both are common in English dialects

8 *Glides from and to Mutes, Post-Aspirates, Sonants*—The essence of the diphthongal character was the glide, which was independent of the sounds of the first and last elements These might be absolutely mute, as in (piip, tAAt, k*oo*k) peep, taught, coke, in which (p, t, k) are mere positions without sounds But the results are quite different from (ii, AA, *oo*), because while the consonant positions are opened out the vowel is at the same time sounded Similarly in the reverse order, when final But here the enclosure of the breath is felt to be uncomfortable, and, if there is no vowel to fall upon, the mouth is opened and a puff of flatus (ʻ), called the "recoil," is heard in England, as (piipʻ) peep! Using then (+) for the gliding sounds, we have (p + ii + p + ʻ), but there is no recoil in (p + ii + p + *i* + q) or (p + ii + p b + *oo'w*!) peeping, peep-bo! Various nations have very different habits in this respect In Indian languages (pʻ) would be felt as a final post-aspirated mute So initially in Germany, the (p) position is usually released, not on a vowel with a clear glottid, as in England and Italy, but on a vowel with a gradual glottid, as (pʻii), and hence flatus is heard before the vowel When this is exaggerated, as (pʻhii) or (pHʻhii), we have the true Indian post-aspirated mute

But an attempt to utter the vowel through a mute position may be made before the position is quite opened out, or the vowel may be continued into it after it has been assumed This gives the English, Italian, and Indian "sonant," as in (b*ee*b) babe The German is not quite the same Here the glides are (b + *ee* + b), with possibly a voiced recoil (b + *ee* + b + '), where (') represents the most amorphous voice This voiced recoil is strong in French, but seldom heard in English, except in declamation, is regular in modern Indian, and impossible to a German, who says at most (b*ee*bpʻ) or (b*ee*pʻ), also Indians and Irish sometimes jerk out their vowel after sonants, as (bH*ee*bHʻ), producing the sonant post-aspirates The ancient Indian never ended words in the pause with sonants, post-aspirated mutes, or post-aspirated sonants, but only with simple mutes, and avoided the recoil

9 *Glides to and from Hisses, Buzzes*—In the case of a hiss, flatus passes through the consonant position and is continued part of the time during which the vowel position is assumed, but towards the end of that time voice is put on Hence in (s + ii) see, the glide (+) is partly flated and partly voiced, so that (s) acts in much the same way as a gradual glottid, similarly when final, as (s + ii + s) cease, where the hiss replaces the recoil But the proportion of voice and flatus in the glide may vary The voice may be put on during the hiss, and then the change takes place in the hiss position The result, far less clear than a vowel, is a hiss (s), followed without a positional glide by the buzz (z), then an entirely vocal glide, the vowel, and a vocal glide, a buzz, and a hiss, as (sziizs) seize, sees The initial (sz) is regular in Germany, where no vowel precedes, as *sie sehen* (szii z*ee*'n), they or you see, and the reverse (zs) is regularly in English seize (siizs) in the pause, and similarly (haavf, briidhth, ruuzhsh, dʒədʒshj) halve, breathe, rouge, judge In the south-west of England Saxon words beginning with *s*, *f* are pronounced with (z, v) initial, which passes through (sz-, fv-) to (s, f)

10 *Glides to and from Flaps*—Flaps are consonants where there is a slack organ which flaps with the breath as it passes The *r* is very varied, but properly voiced, though the flated form occurs The flap may be made (1) with the lips, as (brh), used in Germany to stop horses, (2) with the tip of the direct tongue, (r, ˌr), used in Italy, with the tip of the reverted tongue, (R), used in the south of England and in modern (not ancient) Indian, where it is called "cerebral", (3) with the uvula, (*r*), common in France and north Germany, labialized (*rw*) in Northumberland, and harsher in Greek and Arabic, (4) with the glottis, (ɪ), usual in Denmark, and so on In the educated south of England the tongue is often raised to the (r) position, but not allowed to flap, and is treated as a buzz (r̥)

The above form the *central* flaps, if the point of the tongue is fixed and the voice escapes by the side it causes minute *lateral* flaps of the tongue The place of the point of the tongue discriminates the various sounds which differ but slightly—(ˌl), advanced tongue at gums, Continental, (l), coronal, tongue near the crown of the palate, English (L), reverted, in connexion with (R) in south-west England

Both flaps, especially the latter, are extremely vocal, and the glides from and to them are like those from and to vowels, while they glide readily to and from mutes, sonants, hisses, and buzzes

11 *Glides to and from Hums, Orinasals*—For (p, t, k) both nasal or oral passages are cut off, the former by pressing the uvula against the back of the pharynx Let this pressure be relaxed so that the nasal passage is opened, the oral passage remaining closed The voice passes through the nose, forming the three hums (m, n, q) The glide from these to ordinary vowels is the same as from (b, d, g), and the peculiarity consists in the preceding hum and the closing of the nasal passage as the vowel position is assumed If the nasal passage is left open at all the vowel is "nasalized," and as it resounds partly in the nose and partly in the mouth it becomes an "orinasal" Four principal orinasals exist in French, as *an*, *on*, *un*, *vin* (aA, oA, œA, veA), there are more in Portuguese, and many others in the modern Indian languages The oral vowel is altered in character by nasalization, and it is not possible to assign the oral to the orinasal form precisely If the oral passage is only slightly open, a "nasalized tone" is produced, as in Gaelic, some south German, and American dialects, written as (a,) The hum also may be prolonged, and ('mpaa, 'mbaa, 'ntaa, 'ndaa, 'qkaa, 'qgaa) result These forms exist in South African languages

The final hum may be continued like a vowel If the nose entrance is closed and the voice continued (lim, læm, k*oo*m) become (limb, læmb, k*oo*mb), which, as the ordinary spelling shows, were probably once pronounced But not only the nasality, the voice itself may be cut off, and then we have the mere stops (p, t, k), thus (limp, lint, liqk), which in the pause have the recoil Some phonetists consider (m, n, q) to become flated in this case, as (mh, nh, qh) This is no more necessary than to suppose a vowel to be flated before a mute, so that (læp, mæt, hæk) lap, mat, hack should be (lʻʻæp, mʻʻæt, hʻʻæk), a usage unknown

12 *Palatalization and Labialization*—When a consonant precedes a diphthong of classes iv, v, vi, in art 7 beginning with weak (i, y, u), there is a tendency to take these vowels as nearly as possible simultaneously with the consonant, expressed by writing (j, *w*j, *w*) after the consonant To say (tj) at least two-thirds the length of the tongue from the tip backwards must lie against the palate, for (kj) two-thirds from the root forwards The first occurs in Hungarian, the second was very common among older speakers of English before (æ), as (kjænd'l) Both (tj, kj) are apt to develop into (tɟ), compare *nature*, *kirk*, say (n*ee*tjɐɪ, kjəəɪkj), with colloquial modern (n*ee*tɟɐ, tɟəətɟ) Similarly the voiced sounds (dj, gj) become (dɟ), compare *rig*, *ridge* These (tɟ, dɟ) are consonantal diphthongs = (tjshj, djzhj), as in *ch*est, *j*est, and are distinct from the Indian sounds (kɟ, gɟ) च, ज, which are true mutes, produced by bringing the tongue from

the position for (ɹ) tight up against the extreme back of the hard palate so as to produce a complete stop The most important of the palatalized letters are (lj, nj), the Italian *gli*, *gn* in *miglior*, *ognor* (miljǒ r, ònjǒ r), where the palatalization brings the Italian advanced (,l, ,n) to the position of the English (l, n) The (lj) has degenerated to (ĭ) or (ɹ) in France during the 19th century It exists in Spanish *ll*, Portuguese *lh* The (nj) exists as *gn* in French, *ñ* in Spanish, and *nh* in Portuguese

Parallel to the palatal are the labial forms, of which English *queen*, *guano* (kwiin, gwaa no) are examples They seem to exist in abundance in French, as in toi, doigt (,twa, ,dwa) The palato-labial form (wj), as in *juin* (zhwjeʌ), is much disputed, and a diphthong (zhyéʌ) is usually assumed

13 *Syllables* —A group of speech-sounds increasing in volume from a mute, sonant, hiss, buzz, or flap to a full vowel and decreasing again to one of the former constitutes the ideal syllable (συλλαβή, collection) The initial and final parts may sink to clear glottids, and the middle part to a simple vowel The type of a syllable is then < >, crescendo followed by diminuendo, as in (,aa, ĭaaĭ, tĭaaĭt‘, stĭaaĭts), theoretical, and (dɹədɹd, stieqkth, twelfths), actual syllables The hisses or recoil before or after a stop are not felt as belonging to fresh syllables, because they have no vowel, which is the soul of the syllable Monosyllables present no difficulty, but the division of syllables in polysyllables is not easy to understand In (pu + p + ɪq) the middle (p) ends one set of glides and begins another One syllable ends and the other begins with the assumption of the (p) position which is absolutely mute, so that the end of the first and the beginning of the second syllable are simultaneous, as the end of one hour and the beginning of the next In this case (p) is said to be "medial " But there may be and often is a sensible pause between the two syllables, and then (p) is said to be "double," as (pu + pp + ɪq, puppɪq), in which case no recoil can be used, as (pup‘pɪq) In "syllabizing," a totally artificial process, doubling is necessary, and very frequently the recoil is used, but it never is in speech In (su + s + ɪq) ceasing, there is a sensible hiss between the glides which end the first syllable and those which begin the second, and the syllable divides during that hiss If we wished to produce the effect of doubling, we must break the hiss into two either by a silence or a diminution of force, as (mɪssent) The same remarks hold for sonants, buzzes, and flaps, where we have a sensible voice sound during which the syllable divides Syllables may even divide during a vowel, as French *payen*, *fayence*, *vaillant* (paĭeʌ, faĭaʌs, vaĭaʌ), where the syllable divides during (ĭ), which may even be lengthened to show the two syllables, but, if the syllables have to be sung to notes with a pause between them, we must double the (ĭ), thus (paĭ ĭeʌ, faĭ ĭaʌs), as either (paĭ eʌ, faĭ aʌs) or (pa ĭeʌ, fa ĭaʌs) would be unintelligible The sensation of separate syllables is always easy It is the essence of versification, the oldest form of literature

14 *Accent and Emphasis* —Generally several syllables form a single word, and in many languages—by no means all languages—one syllable in a word is rendered conspicuous Several plans have been adopted for this purpose (1) Quantity or length of syllables, which seems to be all that is known to modern Indians, Arabs, and Persians (2) Heightened or lowered or descending gliding pitch (*con portamento*) of one syllable, which were the acute, grave, and circumflexed syllables of Sanskrit, Latin, and Greek, the position of these syllables in a word there depending partly on the quantity of the syllables and partly on sense, this pitch difference remains in a more complicated form in Norwegian and Swedish (3) Greater force given to one syllable, this is the English, German, and Italian "stress," and from the end of the 3d century A D, when the feeling for quantity faded, was used instead of high pitch in Latin and Greek The modern Italian and modern Greek as a general rule preserve the memory of the syllable which had the high pitch by giving it greater force, with but few exceptions, as Italian *cadere ridere*, to fall, to laugh (4) By a peculiar pronunciation, as the "catch" of the Danes In French none of these methods seem to be consciously adopted Some declare that the last syllable (not counting mute *e*) *always* has the stress, others that it *never* has the stress, others, again, consider the stress to be intentionally even, and when altered to depend mainly on grammatical construction, while there is certainly a raised pitch, frequently towards the close of a phrase or sentence, but sometimes on a penultimate syllable Turks and Japanese have also even stress All these modes of rendering a syllable conspicuous are apt to be called "accent," the Latin translation of προσῳδία, the song added to the word, which properly applied to class (2) only Where pitch accent prevailed there may have been also stress, but that stress was probably as little subject to strict rule as alteration of pitch is in English speech, where it undoubtedly exists, without properly affecting signification Hence we may say roughly that in Latin and Greek pitch was fixed and stress free, but in English and German stress is fixed and pitch free

What accent is to a word, emphasis is to a sentence But there is this difference Accent always falls on a fixed syllable of a word Emphasis varies with the word to be made conspicuous Emphasis does not consist merely in making the stressed syllable of a word louder It depends upon a number of most subtle varieties of qualities of tone, length, and pitch of utterance,—in short, of those tricks and wiles of speech which form the stock-in-trade of actors and orators The same words will mean totally different things according to the place and nature of the emphasis used Different nations emphasize differently To an Englishman French emphasis is apt to seem placed on the wrong word

15 *Intonation* —Although musical accent does not exist in English, almost every county has its peculiar sing-song mode of utterance And even among educated men the sing-song may frequently be heard in public speaking, or in declaiming poetry, or recitation, or reading aloud generally For these things no invariable rule exists But in England questions require the pitch of the voice to be raised, and affirmations to be lowered, towards the end of a clause In Scotland the pitch is raised in both cases, so that to an Englishman a Scotchman seems to be always asking questions

16 *Analysis of Speech-Sounds* —What is heard are sentences consisting of various fixed sounds cemented by gliding sounds, which act one on the other, and thus become greatly modified To construct an alphabet it is necessary from this mass to separate the fixed elements and the changing glides, to crystallize them into symbols, and finally to make the value of those symbols known to the reader The last cannot be done satisfactorily except by *viva voce* instruction, but much can be accomplished by a review of the relations of sounds, made dependent on the relations of the motions of the organs of speech by which they are produced There is a preliminary difficulty in defining an element Perhaps position, flatus, whisper, and voice are the only ultimate elements But it is usual to be very lax Thus (p, t, k) have position only, (f, s, sh, kh) position and flatus, (ɪ, a, u, w, z, zh, gh) position and voice The analysis is therefore only into "proximate" and not "ultimate" elements Again, when a new mass of sound is presented to the ear, a long time passes before the ear becomes sufficiently accustomed to the sound to distinguish the proximate elements and their combinations,

and therefore before the voice can imitate them at all satisfactorily. Hence the best phoneticists differ. It may certainly be considered impossible from a knowledge of a few languages to construct an alphabet which will serve for all. Nevertheless a consideration of some partial schemes is of great value as a stepping-stone. We give Mr Melville Bell's vowel system and Mr Henry Sweet's alteration of Mr M. Bell's consonant system, both supposed to be universal, but neither properly appreciating Asiatic, African, and American-Indian languages and habits of speech. After these follows a modification of a confessedly partial system by the present writer, applying chiefly to English, German, Italian, Spanish, and French, with a few partly theoretical sounds, introduced to show connexions. In all these the sounds will be expressed by palaeotype symbols without any explanation in the tables themselves, because that is furnished at better length than would there be possible in the alphabetical list of art. 20.

17. *Mr Melville Bell's "Visible Speech" Vowels.*—These are arranged primarily according to the height of the tongue, which is supposed to be divided into "back" and "front" or central part, beyond which lies the "point." The heights refer first to the "back" and lastly to the "front," and between them lie the "mixed," for which both back and front are more raised than the "front," so that there is generally a hollow between them. Each set is then divided into "narrow" and "wide," the precise meaning of which, as stated in art. 4, is not settled. Finally come the "rounded" vowels, there being three degrees of rounding,—one for "high," one for "mid," and one for "low" tongue. For convenience here the back, the mixed, and the front are formed into separate groups, and all the vowel signs are numbered, being referred to in the following lists by V and the number, thus V4 is (*u*), which in Mr Bell's nomenclature would be called "high-back wide-round." The letters *n*, *w*, *nr*, *wr* at the heads of columns mean "narrow, wide, narrow round, wide-round."

Mr Melville Bell's "Visible Speech" Vowel Table

Tongue Height	Tongue Back				Mixed				Tongue Front			
	n	*w*	*nr*	*wr*	*n*	*w*	*nr*	*wr*	*n*	*w*	*nr*	*wr*
High	1 ɑ	2 ɐ	3 u	4 *u*	13 ʏ	14 *y*	15 ʊ	16 *u*h	25 i	26 *i*	27 ɪ	28 y
Mid	5 ɑ	6 a	7 *o*	8 o	17 ə	18 ah	19 oh	20 oh	29 *e*	30 e	31 ə	32 œ
Low	9 ɑ	10 *a*	11 ʌ	12 ɔ	21 əh	22 œ	23 *a*h	24 ɔh	33 ᴇ	34 æ	35 əh	36 ah

These positions being insufficient, although supposed to be precisely known, may be "modified" by raising the tongue more (a^1) or lowering it more (a_1), or bringing it nearer the teeth (,a) or nearer the throat (a,). And, even this not sufficing, Mr Sweet has contrived a number of new modifiers, here passed over. And with all this none of the sounds can be produced purely through any position without an effort of will dependent on a conception of the sound. The characteristic of the vowel notation contrived by Mr Bell is that each sign shows at once the position of the sound in the Table.

18. *Mr Henry Sweet's "Sound Notation" Consonant Table*

	a Tongue Back	*b* Tongue Front	*c* Tongue Point	*d* Point Teeth	*e* Blade	*f* Blade Point	*g* Lips	*h* Lip Back	*i* Lip Teeth
	Voiceless Consonants								
1 Open	kh	jh	r₀h	th	s	sh	ph	wh	f
2 Divided	*l*h	ljh	lh	,lh			ph_1		
3 Shut	k	kj	t	,t			p		
4 Nasal	qh	qjh	nh	,nh			mh		
	Voiced Consonants								
5 Open	gh	j	r₀	dh	z	zh	bh	w	v
6 Divided	*l*	lj	l	,l			bh_1		
7 Shut	g	gj	d	,d			b		
8 Nasal	q	qj	n	,n			m		

These signs will be referred to as S 8*c*, or Sweet, line 8, col. *c*, giving (n). The consonants are modified in a similar manner to the vowels. Columns *a*, *b*, *c* indicate straits or contacts between the palate and the parts of the tongue named. By the "blade" is meant the part of the tongue between the "front" and the "point." Mr Sweet's substitutes for glottids and physems, and his and Mr Bell's notation of glides are omitted for brevity. Their notation throughout is entirely different from that here used.

19. A. J. Ellis's partial schemes, modified from his *Speech in Song*.

Vowel Trigram							
1 i	2 *i*	3 *e*	4 e	5 ɛ	6 æ	7 ah	↘
	16 y	17 *ə*	18 œ	19 ɐ	20 ə	21 ɑ	—8 = 22 a
15 u	14 *u*	13 *o*	12 o	11 ɔ	10 ʌ	9 *a*	↗

The meaning of this arrangement is that, if we pronounce the vowels in the order of the numbers, they will form a sufficiently unbroken series of qualities of tone, or, if each line be so pronounced leading to 8 = 22 a, three series of the same kind are produced, and also that the speaker feels that the vowels in the middle line lie "between" the vowels in the first and third lines between which they are written. These intermediate characters refer only to qualities of tone and not to the vowel positions, as they apparently did in the older "vowel triangles" from which the trigram is adapted. The arrangement of Mr Bell is excellent for showing the relations of the positions, but gives no more clue to the relations of sound than the indispensable ratios 1 : 2, 2 : 3, 3 : 4, 4 : 5, 5 : 6 give to the musical sensations of the intervals known as the octave, fifth, fourth, major third, and minor third. Hence the advantage of this additional arrangement. It will be referred to as T 6, that is, trigram, vowel 6, or (æ).

Consonant Table

This table will be referred to as C iv 7, or consonant table, class iv, column 7 = (zh). The glottids and physems are sufficiently explained in art. 5, and are here omitted.

20. *Alphabetical List and Explanation of the Palaeotype Symbols.*—Small letters, italics, small capitals, and the forms resulting from turning them must be sought under the large capital of the same class, where the order of all the letters is specified. Explanations are greatly condensed and often confined to references to the preceding articles and tables, or to an example. The notation for differences of length is explained in art. 6.

A (a ah a'i a'u aʌ a'y, a^1, *a* *a*h, ʌ, ɐ)

(a) V 6, T 8 = T 22, short G m*a*nn, long E f*a*ther, art. 6.
(ah) V 18, T 7, occ. E p*a*ss, p*a*th.
(a'i) art. 7 i, unanalysed diphthong, E *eye*, G *ei*.
(a'u) art. 7 ii, unanalysed diphthong, E h*ow*, G b*au*.
(aʌ) art. 11, F v*en*t, a conventional form.
(a'y) art. 7 iii, unanalysed G fr*eu*de, often (ɔ'*i*).
(a^1) or (a) with higher tongue, IT and F short *a*, nearly = (ah).
(*a*) V 10, T 9. B hears it in E f*a*ther, *a*rms, *a*lms; E does not. Sw and E hear it in LS f*a*ther, E and LLB in F di*a*ble, E in F p*â*te, p*a*s.
(*a*h) V 23. B says (ʌ) with advanced tongue = (,ʌ), (ʌ) on the road to (a).
(ʌ) V 11, T 10, short open in E *au*thority, long closed E *au*l, almost peculiarly E.

(ɐ) V 2, T 19 B hears it in E dungeon, motion, conscious, abandon, honour, bellows E hears it in these syllables and in E parental, capable, capacious, China, and G gabe Sw and Sv hear (ə) in all these cases

Æ (æ, æh)

(æ) V 34, T 6, E gnat, almost peculiarly E

(æh) V 36 B hears it as a Cockney substitute for *ou*, *ow* in *out*, *now*, which E, a born Londoner, does not know Sv finds it to be "open" G *o*, see (y)

B (b bh brh, b_1, bh_1, B)

(b) S 7 *g*, C ii 13, art 8, E *bee*, *ebb*

(bh) S 5 *g*, C iv 12, G *w*, lips flat, not touching teeth, see (ph)

(brh) C vi 13, used by Germans to stop horses, as *wo!* is in England

(b_1) C ii 12, sonant of (p_1), which see, theoretical

(bh_1) S 6 *g*, sonant of (ph_1), which see, theoretical

(B) C ii 11, sonant of (P), which see, theoretical

C (ɔ ɔh, ɔ'ɪ, ç çh, ç çh)

(ɔ) V 12, T 11, E *knot*, almost peculiarly E, replaced on the Continent by (o, oh, *oh*), which see

(ɔh) V 24 B calls it an advanced (ɔ), that is (,ɔ), and hears it as regular short Irish-English *o*, Cockney *ask*, American Chic*ago* Sw hears it in SWD *son* Sv gives no example E does not know it

(ɔ'ɪ) art 7 i, diphthong E *foil*, by some taken as (ʌ'ɪ)

(ç) reverted (s), the under part of the point of the tongue against the palate St[1] hears it in East Norwegian *borse* and also in SWD

(çh) reverted (sh), SN ष, the under part of the point of the tongue against the palate, but lower than for (ç) and pointing further back, see (ɪɟ)

(ç) buzz of (ç), theoretical

(çh) reverted (zh), buzz of (çh), see (DJ)

D (d dɟ dh dj, ,d, dh,, *d*, D DJ Dh, ð ðj)

(d) S 7 *c*, C ii 8, E *doe*, sonant of (t), which see

(dɟ) art 12, E *judging*, consonantal diphthong = (dɟzhɟ), usually assumed as (dzh), and also as SN ज, for which see (gɟ), and AR ج, which Lepsius thinks was also once (gɟ)

(dh) S 5 *d*, C iv 10, E *then*, MG δ, AR ذ, buzz of (th), see (dh,)

(dj) C ii 6, Hungarian *gyongy*, pearl, art 12

(,d) S 7 *d*, C ii 9, F *doux*, tip of tongue against gums, used in some midland and northern E dialects before *r*, *er*

(dh,) C iv 10, SP *lid*, lisped (z), retracted (dh)

(*d*) AR ض (*daad*), described by Lepsius as close emphatic (,l[1]), see (*s*, *t*, *z*) and especially (K)

(D) C ii 7, reverted or cerebral SN ड, common in south-west England, in connexion with (R), which see, by some taken to be retracted (d,), parent of E (d)

(DJ) a reverted consonantal diphthong = (D + çh), heard in Wiltshire (JRDJ) ridge

(Dh) reverted (dh), under part of point of tongue against teeth, theoretical

(ð) Irish Gaelic *dan*, an oak, "broad" post-aspirated sonant The place of tip of tongue unimportant, but generally taken as dental or interdental Essential points, tongue laterally expanded and slack, back raised, leaving a hollow "front" Followed by a slow voice glide, resembling a preponderating E (sh) mixed with (gh) This glide, occurring between a sonant and a vowel, is closer at first than for an ordinary buzz and then more open Constantly used for (dh) by Irish speakers of E [Lecky, MS communication]

(ðj) Irish Gaelic *deas*, palatalized or slender (ð), glide from it like preponderating (ɟ) mixed with (z) [Lecky, MS communication]

E (e eʌ, *e*, E, ə əh, ə[1], ə *eh*, $ə_1$, ɐ, ɐ'*o*)

(e) V 30, T 4, E *net*, SP *e*, medial between F and IT close and open (*e*, E), often (E) in dialectal E B hears it only long in E *there* Sw gives F *père*, which E hears with (EE) Sv gives E *men*, G *manner*, *ähre*, DN *træ* LLB hears it always and only in unaccented IT syllables

(eʌ) art 11, oinasal, F *vin*, conventional symbol

(*e*) V 29, T 3, F *dé*, G *ehre* B says it is found in E always and only in the vanish (*ee*'ɟ), art 6, but E hears the vanish from received speakers only in the pause, otherwise he frequently hears (*ee*) without vanish Sw, Sv, and St do not admit (*ee*) in E without vanish

(E) V 33, T 5 B considers it the regular E sound in *net*, see (e) E hears it long in G *sprache*, F *bête*, IT open *e* Sw hears it in E *air*, LS *men*, F *vin* (VEA) Sv also in DN *lære*

(ə) V 17, T 20 E hears it in his E *nut*, which B wrote (nɐt) from E's dictation, many think (ɐ,ə) are used respectively in E accented and unaccented syllables where E hears (ə, ɐ), and he is very familiar with (ɐ) in dialects Sv gives "stage G" gabe, DN normal gave, SWD gosse

(əh) V 21 Sw gives E *bird*, where E hears (ə) B heard it only in Somerset *sir* and Cockney *penny*, the whole effect of the first appears to E due to Somerset (R), the second he does not know

(ə[1]) intermediate between (ə) and (ɪ), written *u* in Mr Elworthy's West Somerset grammar, a very common and characteristic sound in the dialect, but difficult and strange beyond it

(ə) V 31, T 17, F *feu*, *peu* B hears it in F *dé*, *bât* and in LS E hears it long in G *hohle* Sv says the G sound is (œœ), not (əə), see (y)

(əh) V 35 B hears it long in F *peur*, G *schone*, &c, short in F *jeune*, G *stocke* E hears (əə) in *schone* and (œ) in the rest See Sv in (y)

($ə_1$) intermediate between (ə) and (œ), a common west Somerset sound, possibly Sv's "open G *u*" See under (y)

(ɐ) V 5, T 21 B hears it in F *done*, *young*, *up*, *twopence*, where it sounds dialectal to E, who hears (ə), which see

(ɐ'*o*) art 7 ix, acute inchoant diphthong

F (f, ɟ)

(f) S 1 *i*, C iii 11, E *feel*, lower lip against upper teeth

(ɟ) a turned f, a modifier, laxly used, see mute and sonant (kɟ, gɟ), lateral flap (lɟ), nasals (nɟ, dɟ) and consonant diphthongs (tɟ dɟ, ɪɟ Dɟ)

G (g gɟ gh gj gɟh gɪh *gw* *gwh*, G Gh)

(g) S 7 *a*, C ii 3, art 8, E *gape*, *egg*

(gɟ) S 7 *b*, C ii 5, SN ज, sonant of (kɟ), which see, and also (dɟ)

(gh) S 5 *a*, C iv 3, mid G *tage*, buzz of (kh), which see, and also (gɟh, *gwh*)

(gj) C ii 4, IT la *ghianda*, sonant of (kj), which see, formerly common in E before (a, æ), as *guard*, *garrison*, now generally preserved in *girl*, even in the vulgar form (gɟæl)

(gɟh) C iv 4, mid G *siege*, buzz of (kɟh), which see, confused by Germans themselves with (ɟ), palatalized (gh)

(gɪh) C vi 3, AR غ (gɪháin), or (gh) with the uvula slightly trilled, frequent Dutch *g*, MG γ before (a, o, u) in a mild form, Lepsius takes the AR sound to be (Gh), which see

(*gw*) art 12, C ii 2, E *guano*, sonant of (*kw*), which see, the positions for (g) and (w) are assumed at the same time

(*gwh*) C iv 2, G *auge*, *fuge*, sonant of (*kwh*), which see, labialized (gh) after (*u*)

(G) C ii 1, sonant of (K), which see, theoretical

(Gh) buzz of (G), see above under (gɪh)

H (h 'h 'h ‡h, *h*, H, Hɪh)

(h) when no letter, and, at most, some sign precedes, used for the unanalysed physem, art 5, after a letter very laxly used as a modifier of vowels (ah oh), and consonantal hisses or buzzes (th dh sh zh kh gh), &c

('h) simple flatus, the (h) omitted when another letter precedes, as in the recoil (hæp') hap, art 8

('h) the crudest voice producible, opposed to ('h), the (h) omitted in the voiced recoil (ded') dead, art 8, and in ('l, 'm, 'n, 'ɪ) syllabic

(‡h) smack or click, art 2, (1), the (h) is omitted after consonants showing the clicking parts, as (K‡, tɟ‡, tɟs‡, ,t‡, ɪ‡) guttural, palatal, unilateral, dental, and reverted click, see the turned numerals (8 ⅄ ℒ 9 ƨ), which are used for brevity

(*h*) art 5, physem (2), the AR ح (*haa*), or "wheeze"

(H) art 5, physem (1), the "jerk" or unflated aspirate, used as post-aspirate after Indian sonants, as SN भ (bHə)

(Hɪh) jerked flatus with gradual glottid, art 5, physem (1), the usual aspirate of Scotland and Germany, and the Indian post aspirate after mutes, thus SN ख थ फ are (kHɪh, ,tHɪh, (pHɪh), usually written *kh*, *th*, *ph*, but not to be confused with the palaeotype (kh, th, ph)

I (ɪ ɪ̆a ɪɪ, *ɪ* *ɪ*ɪ, ɪ)

(ɪ) V 25, T 1, short F *fil* (very different from E *fill*), long E *feel*

(ɪ̆a) art 7 iv, typical initial weak (ɪ) diphthong, often confused with (ɟa)

(ɪɪ) art 7 vii, typical murmur diphthong with following permissive trill

(*ɪ*) V 26, T 2, E *knit*, almost peculiarly E and Icelandic, but often heard in Germany, long E (ii) is often replaced by (*ɪɪ*), especially before and after (ɪ) and in singing

(*ɪ*ɪ) art 7 ix, typical grave inchoant diphthong

(I) V 27 B hears it in G *uber*, *gluck*. Sw in F *lune*, where B hears (y), E inclines to (I) in G, but Sv thinks differently, see (y)

[1] *Englische Philologie* I *Die lebende Sprache*, p 42

J (j 'j j, J Jh)

(j) a modifier, symbol of palatalization, art 12, but this simultaneous palatal action is constantly confused with successive (J, i)

('j) art 7 viii, used to express the vanish of (ee, e) towards (i), ending in an approach to the consonant (J), thus (ee'j, e'j)

(j) or (j) without a dot, marks a semipalatalization, the tongue being only approximated to the palatalizing position, observed in several Uralic languages by LLB

(J) S 5 b, C iv 5, E *y*ea

(Jh) S 1 b, C iii 5, E *h*ew, *h*ue (Jhiu), hiss of (J) very close to flated ("ii), art 4

K (k kj kh kj kjh krh kw kwh, K Kh)

(k) S 3 a, C i 3, E *c*ape, perfectly mute, art 8

(kj) S 3 b, C i 5, SN च, the "back" and "front" of the tongue brought closely into the (k) and (J) positions, forming a complete stop, the "point" may rest against the lower gums, and had better do so to avoid the jump up to (tj) *ch*est, with which this mute is constantly confused, but (tj) is more like छ (kJHjh) or post-aspirated (kj), which supplies the necessary hiss

(kh) S 1 a, C iii 3, G da*ch*, SP *j*, see (kjh kwh)

(kj) C i 4, IT la *ch*iave, palatalized (k), art 12 In the 17th and 18th centuries constantly used in E before (a, æ), it may be now constantly heard in London before *ou* in count, called (kjE'unt), or finer (kjéunt) for (ka'unt)

(kjh) C iii 4, G tei*ch*, palatalized (kh), confused with (Jh) by German theorists, but the back of the tongue is higher for (kjh) English people confuse it with concave (sh), which it ought never to approach, though it comes near convex (shj) Either (kjh) or (kjh), the hiss of (kj), which was not distinguished from (Jh), was the original SN श, now called (sh) and confused with ष, properly (çh), see under C

(krh) C v 3, AR خ, a (kh) with the uvula slightly trilled, as in Dutch *ch*, Lepsius considers both to be (Kh)

(kw) C i 2, art 12, E *q*ueen (kwiin), not (kwiin)

(kwh) C iii 2, LS *quh*at (kwhat), G au*ch*, bu*ch*, art 12 labialized (kh)

(K) C i 1, AR ق (Kaaf), the tongue greatly retracted and wedged against the uvula Lepsius considers the proper sound of AR ق to be (G), the sonant of (K) By Syrian Mohammedans and often by Egyptians the ق is lost or rather becomes hamza (,), as (,aa la) for (Kaa la) said "Emphatic" character attaches to AR ق ح غ ط ص ض ظ, here written (K krh grh *t d s z*), which Lepsius takes to have the values (G KH Gh ,d¹, ,l¹, s¹, dh¹) respectively, this "consists in a modification of the vowel by narrowing [the passage below] the soft palate", these letters are called "high" by the Arabs because of this very high back of the tongue They call the emphatic pronunciation "thick, rough, fatty" In fact (a) becomes (*a*), (o) remains, (e, i) become (E, *i*), (u) is scarcely changed Europeans recognize the consonants mainly by this vowel change

(Kh) hiss of (K), considered by Lepsius to be the proper sound of what is here written as (krh)

L (l lj ljh lh lj lS lSh, 'l, ,l ,lh, *l lh*, L Lh, l lj, ɪ ɪh, ɿ)

(l) S 6 c, C viii 8, art 10, E gu*ll*, tip of the tongue far behind the gums, replaced on the Continent by (,l)

(lj) S 6 b Sw says "(l) formed in the place of (J)," and hears it in IT *gli*, SP *ll*, PR *lh*, where LLB and E hear (lj)

(ljh) S 2 b B says it is "a variety of defective *s*," theoretical

(lh) S 2 c, C vii 8, flated (l), not Welsh *ll* B hears it before (t) in fe*l*t, as (fElht) E hears no trace of it, any more than he hears ("e) in (wet)

(lj) C viii 6, art 12, IT *gli*, SP *ll*, PR *lh* LLB and E hear this as a palatalized E (l), not Continental (,l), the palatalization having retracted the (,l)

(lS) C viii 8, voiced form or buzz of unilateral Welsh *ll*, see (lSh)

(lSh) C vii 8, or more conveniently (lhh), Welsh *ll*a*ll*, put tongue in position for (l), raise the left side to touch the palate, let flatus escape by the right side The tongue is then in the position assumed *after* making the unilateral click (tjS‡), see (‡h) under H This unilaterality is insisted on by Salesbury,[1] and E was thus taught in Wales Sw[2] also insists on it Some Welshmen do not

('l) E litt*le*, syllabic (l), the voice of the lateral flap sufficing to form a syllable when final

(,l) S 6 d, C viii 9, F *l*ait, the tip of the tongue against the gums, as is usual out of England

(,lh) S 2 d, C vii 9, flated (,l), occ F peup*le*

(*l*) S 6 a, PL guttural or "barred" *l*, that is, *l* with a slanting line drawn through it The back of tongue is raised as high as for (K) St[3] finds E *l* after a vowel in the same syllable half guttural, this is unknown to Englishmen

(*lh*) S 2 a B calls it "the hiss of a water-fowl," the hiss of (*l*), theoretical

(L) C viii 7, reverted *l*, the underpart of the point of the tongue coming against the hard palate, used in conjunction with (P) in south-west England, as wor*l*d (wəRD'L) Those who used retracted (r,) say (wər,d,'l,)

(Lh) C vii 7, flated form of (L), theoretical

(l) Irish Gaelic "broad" *ll*, as in a*l*t (the *l* being written singly because of the following *t*, at the end of a word it is always written *ll*), tongue in the same position as for (D), which see, but with the lateral emission of the *l* class [Lecky, MS communication]

(lj) Irish Gaelic "slender" *ll*, as in Irish Gaelic, mi*ll*, this bears the same relation to (l) as (tj) does to (t), see (tj) [Lecky, MS communication]

(ɪ) turned l, the gradual glottid, art 5

(ɪh) an exaggerated form of the gradual glottid, art 5, and see (Hɪh) under H

(ɿ) turned L, DN ?et, glottal ? Donders says "sing a note as deep as possible, and then try to sing a lower one, the voice will be replaced by a peculiar crackling noise," which is (ɿ), it is the common form of DN ?

M (m mh 'm, ᴎ)

(m) S 8 g, C x 13, art 11, E *m*u*mm*ing

(mh) S 4 g, C ix 13, flated form of (m) B hears it before mutes in place of (m), as ca*m*p (kæmhp), E does not, art 11

('m) syllabic *m*, E chas*m* (kæz'm)

(ᴎ) turned M, C vi 12, E defective ? in ve*w*y (veᴎi) very, differing from (bih) by having tight and flat in place of loose and round lips, with minute instead of considerable excursions of the flap

N (n nj nh nj, ,n ,nh, 'n, N, n nj)

(n) S 8 c, C x 8, E *n*o, tongue as for (t), mouth open or closed indifferently, as the tongue is an effectual stop, art 11

(nj) a nasalized (lj), which those take to be IT *gn* who assume IT *gl* to be (lj), see (nj, qj)

(nh) S 4 c, C ix 8, flated (n), used in Cumberland for initial *kn*, in *kn*ow (nhoo) B hears it before mutes, as in be*n*t (bEnht), E does not, see art 11

(nj) nasalized (dj), the tongue lies along the palate in the same way as for (dj), but the nasal passages are now open LLB and E hear it as palatalized E (n), not (,n), IT *gn*, SP *ñ*, PR *nh*, F *gn* St[4] takes the F sound to be (qj) E has not detected (qj) in native F speakers, after long-continued express observation

(,n) S 8 d, C x 9, F *n*ain, tongue on gums

(,nh) S 4 d, C ix 9, flated (,n), theoretical

('n) syllabic (n), E ope*n* (oop'n)

(N) C x 7, reverted (n), tongue as for (T), SN ण, south-west E *n* in connexion with (R), as (həRN) ran

(n) Irish Gaelic "broad" *nn*, as in dra*n*t (the *n* not doubled because of following *t*), tongue as for (t, D), which see, but with nasal passages open [Lecky, MS communication]

(nj) this bears the same relation to (n) that (tj) does to (t), Irish Gaelic "slender" *nn*, as in bi*nn* [Lecky, MS communication]

O (o oh oA óy, *o* oh)

(o) V 8, T 12, short IT open *o*, nò, long in E *o*re (oor), which is fast degrading in London to (AA'ɐ)

(oh) V 20 Sw and Sv hear (oh) and neither (o) nor (*o*h) in F h*o*mme, which E hears as (om), very different from E (om) B hears (oh) in colloquial eloquence, philosophy, opinion, and American whole, in all of which E hears (*o*)

(oA) art 11, F v*on*t, a conventional form, not to be confused with (aA)

(óy) art 7 iii, theoretic form of G *eu*, see (a'y)

(*o*) V 7, T 13 B hears it short in E goer, m*o*wer, E in poetic, foll*ow*ing B hears it when long in E always and only with the vanish (*oo'w*), art 6, art 7 viii E hears (*oo'w*) in the pause, but otherwise generally (*oo*), and (*óou*) is always erroneous

(*o*h) V 19 B says this is a mixture of (*o*) with (I) or is (*o*) with advanced tongue, that is, (,*o*), he hears it in F h*o*mme (*o*hm), where E hears (om), see (oh)

Œ (œ œA œ'y, *œ œ'u*, Œ, ꝏ ꝏ)

(œ) V 32, T 18, F v*eu*f, G b*ö*cke See Sv under (y)

(œA) art 11, orinasal F *un*, chac*un*, conventional symbol

(œ'y) art 7 iii

[1] *Welsh Pronunciation*, 1550
[2] "Spoken North Welsh," in *Trans Philol Soc*, 1882 84, p 418

[3] *Englische Philologie* I *Die lebende Sprache*, p 74
[4] *Ibid*, p 47

(æ) V 1 B hears it in Scotch Gaelic *laogh*, it may be produced by saying (uu) and suddenly opening the mouth, see (æ'u)

(æ'u) acute inchoant diphthong, art 7 ix, or (uu), begun with the mouth open and without internal rounding, very common in south Lancashire and Cheshire

(œ) V 9 B makes it the "narrow" form of (a), and the regular form of LS *up*, come, Sw occ LS form

(ɶ) V 22 B hears it as the regular E sound of *er*, *ir*, *yr* Sw hears it in the first element of *how* (hɶ'u), which E finds dialectal

(ɒ) a dialectal south west English sound of (ɐ) through which a sound of (A, ɔ) seems to run, and usually appreciated as the latter

P (p ph prh, p_1, ph_1, P)

(p) S 3 *g*, C i 13, E *peeping*, perfectly mute, art 8

(ph) S 1 *g*, C iii 12, Hungarian *f*, MG *φ*, an (f) spoken by the lips only without the teeth, mouth in position for blowing to cool, flated form of (bh), which see

(prh) C v 13, flated form of (brh), common with babies before they can speak

(p_1) C i 12, mute of (ph), the lips closed flat to form a complete stop, theoretical

(ph_1) S 2 *g*, middle of lips in contact, flatus expelled from each corner of the mouth, theoretical

(P) C i 11, mute of (f), lower lip forming a complete stop with upper teeth, theoretical

Q (q qj qjh qh qj)

(q) S 8 *a*, C x 3, E *singer*, *finger*, (g) with nasal passages open

(qj) S 8 *b*, C x 5, SN ञ, nasal of the palatal series, see (kj gj) Bopp considers it to be F *gn*, and Sw hears it in F and IT *gn*, SP *ñ*, PR *nh*, in all of which LLB and E hear (nj) only

(qjh) S 4 *b*, flated (qj), theoretical

(qh) S 4 *a*, C ix 3, flated (q) B hears it before mutes, as *sink* (siqhk), E does not, art 11

(qj) C x 4, palatalized (q), different from (qj)

R (r rh rsh, r_o r_oh, ,r ,rh ,r_o, ɾ ɾh ɾw, r_o, R R_o, ɹ)

(r) C vi 8, E *ring*, tip of tongue far behind gums, flap weak in England, strong in Scotland and Italy

(rh) C v 8, flated form of (r)

(rsh) PL *przez*, tongue in position for (sh) with point flapped

(r_o) S 5 *c*, C ii 8, imperfect (d), the tongue not quite in contact, almost (zhj), imperfect (r), the flap being omitted, considered by B and Sw as normal (r), a sign for flapping being added where a trill is used Sv makes E *r* before a vowel regularly (,r_o) To E, a born Londoner, (r_o) before a vowel is very difficult to utter

(r_oh) S 1 *c*, flated (r_o), theoretical

(,r) C vi 9, SP *rey*, IT *rè*, fully trilled *r* with the point of the tongue advanced to the gums

(,rh) C v 9, flated (,r), occ F *nôtre*

(,r_o) alveolar unflapped (,r), see (r_o), possibly the "soft" SP *r* in *amar*, *arado*, *breve*

(ɾ) C vi 3, Parisian *Paris*, uvular *r*, art 10 (3), resembling (grh)

(ɾh) C v 3, flated (*r*), common as a G final *r* in the pause, and then greatly resembling a faint (krh)

(ɾw) C vi 2, labialized uvular (*r*), regular in Northumberland

($ɾ_o$) untrilled uvular (ɾ), heard faintly between vowels in Northumberland, in *very*, *merry* (va^1$ɾ_o$i, ma^1$_o$i), almost (v'ai, m'ai), like IT *vai*, *mai*

(R) C vi 7, reverted or cerebral *r*, the underpart of the point of the tongue brought near the palate, and, according to E's observations, allowed to flap, but constantly asserted to be unflapped, see (R_o) Common in modern Indian, not in SN, and found in Norway and Sweden [1] The characteristic of south of England dialectal speech, and parent of received E *r* and the vocal degeneration of *r*, art 7 vii By some considered as greatly retracted (r,)

(R_o) C iv 7, unflapped variety of (R), supposed to prevail for (R), which see

(ɹ) art 7 vii, fully degenerated vocal (R), which may be followed permissively by a trilled or flapped (r), forming the murmur diphthongs

S (s sh shj sj, ,s ,sh, *s*, ʂj)

(s) S 1 *e*, C iii 9, E *seal*, hissing, with a convex tongue forming a central strait, the sides being held firmly by the palate and teeth, point tense and unmuffled, with many unconscious varieties

(sh) S 1 *f*, C iii 7, E *rush*, tongue retracted in respect to (s), upper surface rather hollowed than convex, see (çh, shj) and occ lips projected, as E *hush* (hesh[5])

(shj) C iii 8, (sh) with convex tongue, tip somewhat depressed, second element in (tj = tjshj), High G *s* initial before *p*, *t*, as *spielen*, *stehen*, where (sh) is not admissible

(sj) C iii 6, PL *koś*, palatalized (s), art 12

(,s) C iii 9, point of tongue advanced nearly to teeth LLB hears it in Tuscan sharp IT *lo zio*, usually taken as (,t,sio)

(,sh) advanced (shj), tongue convex and nearer the palate LLB hears it in Tuscan *pece* (pe ,she), and considers it the only proper sound of IT *c* before *e* and *i*, which is usually assumed to be (,t,sh) or (,tj), but an Englishman's (tj) is quite intelligible

(*s*) AR ص (*saad*), according to Lepsius a close emphatic *s* or (s[1]), see (K) and (*d*, *t*, *z*)

(ʂj) Irish Gaelic *ciste* (,kjiʂjtje,) treasure, *s* of the same series as (tj), which see [Lecky, MS communication]

T (t tj th tj, ,t, th,, *t*, T TJ, *t* *tj*)

(t) S 3 *c*, C i 8, E *too*, tip of the tongue far behind the gums, generated by reverted (r), with which it is confused by Indians, who use their cerebral ट ड for E (t, d)

(tj) E *chest* = (tjshj), art 12, not to be confounded with (kj), which see

(th) S 1 *d*, C iii 10, E *thin*, Icelandic þ, MG *θ*, AP ث, point of tongue against back of front teeth, hiss produced by flatus escaping between tongue and teeth, not necessarily between the interstices of the teeth, as Sw says

(tj) C i 6, Hungarian *ty*, palatalized (t), art 12, see (dj)

(,t) S 3 *d*, C i 9, F *tas*, usual Continental alveolar *t*, with the tongue against gums, SN त, found in some midland and northern E dialects before *r* or *-er*, see (,d)

(th,) C iii 10, SP *z* everywhere, and *c* before *e*, *i*, vo. *zopo*, *ceūo cinto*, lisped (s), tongue against gums, and hence a retracted (th), see (dh,) LLB hears it in IT *vizio*, where it is generally assumed to be (,t,s)

(*t*) AR ط (*taad*), which Lepsius describes as a close emphatic (,d[1]), see (K)

(T) C i 7, reverted or cerebral SN ट, with underpart of the point of the tongue against the palate, common in south-west E in connexion with (R), parent of received F (t)

(TJ) consonantal diphthong = (Tçh), heard in Wiltshire in connexion with (R), as (ɐRTJ) rich

(*t*) Irish Gaelic "broad" post-aspirated mute, as in Irish Gaelic *alt*, *tá*, *tu* The place of the tip of the tongue is apparently unimportant, but it is generally assumed to be dental or interdental The essential points are that the tongue is laterally expanded and slack, while the back is raised, leaving a hollow in the "front" It is followed by a slow flated glide, while the position changes to that of the vowel, resembling a greatly predominating (th) mixed with (kh) The voice is not put on till the vowel position is reached This is constantly used for (th) by Irish speakers of English [Lecky, MS communication]

(*tj*) Irish Gaelic "slender" form of post-aspirated mute, as in *ailt*, of a knuckle, the tongue is spreading and slack, the part nearest to the palate is about an inch on the inner side of the tip, being more towards the back than in the position for (s), the "front" being also raised, the tip is not turned up and its position is unimportant The glide of the post-aspiration sounds like a predominating (rh) mixed with (s), being tighter at first and looser afterwards than the E (rh) [Lecky, MS communication]

U (u ŭa, *u* *uh* *ŭu*, u_1, U)

(u) V 3, T 15, short E *to* unemphatic, F *poule*, replaced by (*u*) in E, long E *too* Some phoneticists make the E long (uu) to be always (*u*u) or (*u*w)

(ŭa) art 7 vi, where (ŭ) replaces (w), F *oie* (ŭa), *oui* (ŭi), in *soi*, *doigt*, &c LLB considers that (s, ,d), &c, are labialized, art 12.

(*u*) V 4, T 14, E *full*, *wood*, *woman*, *could*, "wide" form of (u)

(*uh*) V 16. B hears it in the "colloquial" use of E *awful*, *fissure*, *nature*, *fortune* (which E does not understand), but says also that it is (*u*) with a raised tongue, and hence = (u^1) Sw hears it in SWD *upp*, Sv and St in Norwegian *huska*

(*ŭu*) art 7 ix, grave inchoant diphthong, possibly Sw's (*u*w), common dialectally in Cumberland and Westmorland

(u_1) midland E vowel replacing (ə, ɐ) E feels it to be near (o^1), or to be a "thickened" (*u*), Mr Hallam, to whom it is native, considers it to have the tongue intermediate to its position for (*o*, u), and the closure of the lips equal to that for (*o*), but made with flattened lips In Yorkshire, Cumberland, and Westmorland it is replaced by (*u*), with which most received speakers confound it

(U) V 15 Sw hears it long in Norwegian and SWD *hus*, *ut*, and says it is not far from F *lune*, but see (y) St [3] considers it intermediate between (u, y)

[1] *Englische Philologie* I *Die lebende Sprache*, p 1

[3] *Ibid*, p 328

V (v, ʌ)

(v) S 5 i, C iv 11, E veal, voiced (f), easy for E, F, IT, hopeless to G, SP, AR, MG, and Hungarian. Indians use (v) with lower lip against upper teeth, but the dentality is not prominent; they read SN व in this fashion when not following a consonant; when it does, it reverts to (ŭ) rather than to (w), as (anusňaara), not (anuswaara). In Bengali both व ब are called (b), which may be compared with SP (bh) for (b, v)

(ʌ) a turned v, regarded as an imperfect N, without the last upstroke, N, after a vowel represents F nasality, art 11, and used also for that of PR and modern Indian, in which the nasality seems much harsher, written like Greek η

W (w wh, w wj, 'w)

(w) S 5 h, C iv 13, E we (wii), with which compare F vie (vii), oui (ŭi) and G wie (bhii), possibly AP ؤ

(wh) S 1 h, C iii 13, E whey, which, wheel, whale, as distinct from way, witch, weal, wail, the distinction, however, is nearly obliterated by received speakers, who use (w) for both (w, wh), which is like saying veal, vale, vile for feel, fail, file, yet they laugh at the Somersetshire peasant for using initial (v) for (f). Some consider (wh) to be (hw), meaning (whw), and others to be (hŭ)

(w) a modifier to show labialization, art 12, see (kw)

(wj) art 12, symbol of LLB 's presumed palato-labialization, by attempting to pronounce (y) at the same time as a preceding consonant, as F lui, nuit, which on this hypothesis are (,lwji, ,nwji) and not (,lyi, ,nyi)

('w) an indefinite vowel sound approaching to (u), towards which E (oo) vanishes, art 6

Y (y yi, y₁, y Y)

(y) V 28, T 16. B and E hear this in F une. Sw thinks the F sound to be (I). Sv, speaking of the two series of vowels (I ə əh) and (y œ æh), says what is equivalent to close G u in uber = (ə), the lips being often pressed against the teeth, open G u in hutte = (ə₁), somewhat more open than (ə), close G o in schon = (œ), open G o in bocke = (æh). Sv also makes F u in lune and DN y in lys = (I), F eu in peu = (ə), SWD o in for = (əh), which last he believes to be the vowel nasalized in F un. Sw also makes DN y in lyst = (y) and F eu in peuple = (œ)

(yi) art 7 v, F huile, see also (wj)

(y₁) intermediate between (y, ə), frequent in west Somerset and Devon, where it replaces the received long (uu) and the received diphthong (iu)

(y) V 14. B considers that E (i, i, e e) when unaccented tend to (y), as in return, limit, Saint Paul's, captain, there is, and regularly unaccented the. Sw hears it as occ E in pretty. E has not observed this change

(Y) V 13. B hears it long in American sir. Sw [1] says "the only Russian vowel which offers any special difficulty is the ЫI, first correctly identified by B as (Y)." Lepsius [2] describes it as having (u)-tongue and (i)-lips, which would give (œ), and not (Y). Sw [3] also identifies both North Welsh u and occ y, as in sut, ty, with (Y), replaced by (i) in South Wales. The PL and Bohemian y have the same sound

Z (z zh zhj zj, ,z ,zh, z)

(z) S 5 e, C iv 9, E zeal, buzz, not in SP or Indian

(zh) S 5 f, C iv 7, E division, F j. St [4] says the E and F sounds are different, the F being more dental

(zhj) C iv 8, voiced (shj), found in E (dj = djzhj)

(zj) C iv 6, PL leź, voiced (sj), palatalized (z), art 12

(,z) C iv 9, IT lo zelo, according to LLB. Usually conceived as (,d,z), voiced (,s), which see

(,zh) voiced (,sh), which see, heard by LLB in IT regio, usually accepted as (,d,zh), for which the Englishman's (dj) is sufficiently intelligible

(z) AR ظ (zaa). Lepsius considers this to be a close and emphatic (dh)—that is, (dh¹), see (K)—but that in some places it is incorrectly pronounced as an emphatic (z) and in others as an emphatic (,d)

NUMERALS (ʒ ɛ ɛh ǂ ɡ ʆ 8, ¹ ₁ ⁴ ⁵)

(ʒ) Kaffre reverted click = (r‡), see (‡h) under H, Appleyard's q

(ɛ) AR ع (ɛáin), see art 5 (4)

(ɛh) "trilled wheeze," differing from (h) solely by a rattle of mucus

(ǂ) Hottentot bilateral palatal click, Boyce's qc = (tj‡), see (‡h)

(ɡ) Kaffre dental click, Appleyard's c = (,t‡), see (‡h)

(ʆ) Kaffre unilateral palatal click, Appleyard's x = (tj8‡), E click to start a horse, see (‡h) and (lsh)

(8) Waco (North-American Indian) guttural click = (K‡), see (‡h)

(¹) modifier, meaning properly "with raised tongue," used laxly, see (K)

(₁) modifier, meaning properly "with lowered tongue," used very laxly, as in (ə₁, y₁, v₁, p₁, b₁, ph₁, bh₁), which see

(⁴) modifier, meaning "internally rounded" by compressing arches of palate, art 4, as in a parrot's puss (p⁴u⁴s)

(⁵) modifier, meaning "with projecting lips," compare (pus, p⁵u⁵s, p⁴u⁴s), and Devon (æ'y₁⁵), art 7 iii

POINTS (, , ' ' ' " ,)

(,) clear glottid, art 5 (1)

(,) check glottid, AR hamza, art 5 (3)

(') suddenly stop, or absence of recoil in the pause, as (sɪrae wak'), not (sɪraa wak')

( ) (1) after a vowel shows that the syllable has a secondary stress, as (nə minee shən) nomination, (2) before a whole word indicates the secondary emphasis usually shown by a capital, as (paal, pAAl) pall, Paul

( ) before a letter shows that it is especially strongly uttered, emphasis on a single element, as (hæt, h æt, hæ t) hat, hat, hat, as distinct from "at, hot, had," see (A)

( ) (1) after a vowel shows that the syllable containing it has the principal stress, (2) prefixed to a word shows it to be emphatic, a substitute for italics, as (wɪl)i kəm? wɪl hii kəm?) will he come? will he come? art 14

(') (1) before (h), see ('h) under H, crude voice, (2) before voiced letters, rendering the voice syllabically prominent, see ('l 'm 'n), &c, (3) more laxly used in ('j, 'w) for indefinite vowels near (i, u), (4) after sonants, voiced recoil, as (ded') dead, art 8

(') (1) abbreviation for ('h) flatus, which see under H, (2) before voiced letters indicates whisper, art 4, (3) after mutes, flated recoil, as (det') debt, not written unless it is necessary to call attention to it

('') before voiced letters, reduces them to flated, as (''ii), art 4

(,) after a vowel or consonant nasalized by partial opening of nasal passages, in Gaelic, south G, occ American

ACCENTS (' " ,, ,,, ' " ''')

(') (1) mark of diphthongization, placed over or after stressed element, art 7, (2) after (a) and not over it, as (a'i), distinct from (ái), mark of unanalysed diphthong, art 7

('') in place of ('), mark of slurred diphthongs, art 7

(,) (1) after a letter shows retraction, as (d,, dh,), &c, (2) (,,) more retraction

(') (1) over or after a vowel denotes medial length, often united with diphthongal (') forming a circumflex, as (âa, ə'i), (2) after a consonant shows that it is held, the position being maintained throughout even when mute, as (det'), used for the north of England definite article (t'man) the man, distinctly different from (tman, təman, ətman). (,) prefixed to a letter means "with tongue advanced towards the teeth," see (,t ,d ,n), (3, 4) (,, ,,,) more advanced, as (t) tongue point some way behind gums, (,t) tongue point on gums, (,,t) tongue point on teeth, (,,,t) tongue point on upper lip

SIGNS (‡ ɩ ı +)) ɩ)

(‡) abridgment of (‡h), which see under H

(ɩ) mark of trill or flap, used in transliterating B and Sw, thus their equivalent of (i₀ɩ) = (r)

(ı) symbol of inspiration, art 2 (2)

(+) symbol of glide or speech-sound with changing position, when simple juxtaposition is insufficient, arts 2, 8

()) the second half of a parenthesis ()) cut at the height of a non-ascending letter, symbol of "break," showing that there is no glide between the letters juxtaposed. Thus (s+n) is usually written (sn), but (s)n) are the two letters and their sounds (s,n) without any glide, of great use in theoretical discussions

()) the second half of a parenthesis placed between two letters shows that, though they belong to different words, they run on with a glide as if they belonged to the same word, very convenient in dialect writing, (ool')d)ɪ mən) old woman, usually written ole dumman by dialect writers, here (') shows that (l) is held, but ()) marks that it does not run on to the (d), which, however, is shown by ()) to belong to the same word with (l), but to run on to (ɪ) in the next word

(ɩ) is [cut at the height of a non-ascending letter and shows that the letter it precedes is scarcely perceptible in speech, as (mádh,rɩdh,) Madrid

There are many more palaeotype letters and signs, here omitted for brevity, but found necessary for phonetical discussions

21 *Practical Alphabets* —The above alphabetical list comprises

[1] "Russian Pronunciation," in *Trans Philol Soc*, 1877-79, p 544
[2] "Die Arabischen Sprachlaute und Sclavisches y," in *Trans Berlin Acad Sci*, 1861, p 150
[3] "Spoken North Welsh," in *Trans Philol Soc*, 1882 84
[4] *Ibid*, p 43

243 symbols, made up of 192 elements, 14 vowel diphthongs, 4 consonant diphthongs, 19 modifiers, and 11 other signs. It has been reduced to the smallest possible number suitable for giving a notion of the kind of symbolization required for universal alphabets. The list from which it was extracted contained double the number and was still incomplete, even so far as the writer's investigations had extended. A universal alphabet would probably require a thousand cases to be provided for. It would be difficult for even the inventors to use such an alphabet, and absurd to present it for practical use. Inventors have therefore had recourse to *radical* signs symbolizing what they consider the principal relations and modifiers of these radicals. Some, as Brucke, Merkel, Bell, and Sweet, use entirely new characters, of which Bell's and Sweet's are intended by their shape to recall the positions of the organs of speech in uttering the sounds represented. But these writers are not agreed either as to the shape or value of the radicals themselves. The modifiers are very various, and when more than one modifier is required the characters become too complicated for the eye and hand to deal with them rapidly. Universal writing is still a philosopher's stone, though much has been learned in its pursuit. Palaeotype is of course a mere typographical makeshift.

Fortunately writing long preceded phonetic knowledge. The number of distinct sounds in any one language seldom exceeds fifty, and practically fewer still are needed, for a native needs only a broad hint of the sound to reproduce it. The signs for English in art. 1 are rather superabundant than deficient, and the small additions of foreign signs suffice for French, German, and Italian practically, though very deficient scientifically. In fact, the modes of combining sounds in those three languages and English are so different that the alphabet has to be differently conceived for each. This is the final breakdown of universal writing. An English, German, French, and Italian reader, each requires an alphabet founded on his own linguistic habits, and very insufficiently comprehends any other. But even a rough appreciation for linguistic purposes is better than the thoroughly false appreciations now current. To obtain a scientific foundation for erecting an alphabet of any language which shall have scientific value, five stages are needed:—(1) the perfect acquisition of a series of words containing every sound used; (2) variation of each word by involving its sounds in different combinations to appreciate the effects of gliding juxtaposition; (3) the perfect acquisition of short sentences of different characters to understand the effects of construction and emotion; (4) the study of unrestrained conversation between natives from the phonetic point of view; (5) frequent writing from the dictation of natives and teaching others to read by the signs adopted after the first four stages are passed. How far the characters should indicate the positions of the organs of speech is another point, which need not be considered at first, and can only be accomplished with extreme roughness even at last. Thus Bell's capitally conceived and executed "visible speech" requires much explanation to be intelligible and after all tells but little. Any signs easy to write and distinct to read without wearying the eye will suffice, provided each be furnished with a full explanation (much longer and more explicit than the greatly condensed explanations of art. 20) not only of its separate but its combined power, and the requisite knowledge for furnishing these cannot be obtained without much and long continued labour. Mr Sweet's studies of Danish, Swedish, Russian, Portuguese, and North Welsh pronunciation are models in their way, especially the last, but suffer from extreme conciseness.

The use of such phonetic studies is principally philological, a much smaller amount of precision sufficing for all the purposes of ordinary life,—understanding speech and speaking intelligibly, writing speech from dictation and reading what is written. Our scientific knowledge of speech-sounds has really only just commenced, and is therefore extremely incomplete and confined to very few people. But what has as yet been learned is of great practical value in the reduction of unwritten dialects and languages to writing, in exhibiting the actual speaking habits of existent written tongues, in divining the intention of systems of writing employed in extinct languages, and hence in historically tracing the cognation and filiation of one language to another and the successive forms assumed in the gradual development of a single form of speech. These great applications of the study of speech-sounds, as well as the practical introduction of systems of spelling easier to read and write than those now found in most of Europe (including European America) and Asia, lie beyond the scope of this article, which only aims at showing in extremely condensed terms the foundations of the theory of their combinations and some of their most important and best known forms.

Bibliography.—Subjoined is a list of the principal works on the subject since 1844 inclusive, in alphabetical order of the writers. E. Behnke, *Mechanism of the Human Voice*, 3d ed., 1882; Behnke and Brown, *Voice, Song, and Speech* (see Brown); A. Graham Bell, "Vowel Theories," in *Amer. Jour. of Otology*, July 1879; A. Melville Bell, *Visible Speech*, 4to, 1867; Id., *Sounds and their Relations*, fls. 4to, 1881; Prince L. L. Bonaparte, "Vowels and Consonants," in Ellis's *Early English Pronunciation*; Id., "Portuguese Simple Sounds," in *Trans. Philol. Soc.*, 1880-81; Id., "Simple Sounds of all living Sclavonic Languages," *ibid.*; Lennox Brown and Emil Behnke, *Voice, Song, and Speech*, 1883 (with photographs of living vocal chords). Ernst Brucke, *Grundzuge der Physiologie und Systematik der Sprachlaute*, 1st ed. 1856, 2d ed. 1876; Id., *Neue Methode der phonetischen Transcription*, 1863; Johann Czermak, "Physiologische Untersuchungen mit Garcia's Kehlkopfspiegel," in *Vienna Acad. Math. Phys.*, vol. xxix., 1858; Id., "Spiritus Asper und Lenis, Flusterstimme, Kehlkopflaute," *ibid.*, vol. lii., part v.; F. C. Donders, *De Physiologie der Spraakklanken*, 1870; Alexander J. Ellis, *Alphabet of Nature*, 1844-45; Id., *Essentials of Phonetics*, 1848 (printed in phonotypy); Id., *Teacher's Guide to the Reading Reform* (introducing "glides"), 1853; Id., "Palaeotype," in *Trans. Philol. Soc.*, 1867; Id., *Early English Pronunciation*, parts i. and ii. 1869, part iii. 1871, part iv. 1874, in progress; Id., "Accent and Emphasis," in *Trans. Philol. Soc.*, 1873; Id., *Pronunciation for Singers*, 1877; Id., *Speech in Song*, 1877; W. R. Evans, "Phonetic Outlines," in *Spelling Experimenter*, 1884, vol. ii.; Ewing (see Jenkin); S. S. Haldeman, *Analytic Orthography*, Trevelyan prize essay, 1860; H. Hale, "Doubtful or Intermediate Articulations," in *Jour. Anthropol. Inst.*, February 1885; H. Helmholtz, *Tonempfindungen*, 1st ed. 1862, 4th ed. 1877, 2d ed. of A. J. Ellis's translation, "Vowel Theory," 1885; Fleeming Jenkin and J. A. Ewing, "Harmonic Analysis of certain Vowel Sounds," in *Trans. R. Soc. Edin.*, 1879, vol. xxviii.; Ch. Joret, *Du C dans les langues Romanes*, 1874; J. P. N. Land, *Uitspraak en Spelling*, 1870; R. G. Latham, *English Language*, 4th ed. 1855, vol. ii. part iii., "Phonesis"; James Lecky, "Irish Gaelic Sounds," in *Proc. Philol. Soc.*, June 1884 and May 1885; R. Lepsius, "Chinesische und Tibetische Lautverhaltnisse," in *Trans. Berlin Acad. Sci.*, 1860; Id., "Die Arabischen Sprachlaute und Sclavisches y," *ibid.*, 1861; Id., *Standard Alphabet*, 1863; J. A. Lundell, "Det Svenska Landsmålsalfabet," 1879, part of *Nyare Bidrag till Kannedom om de Svenska Landsmålen*, 1878, Stockholm; C. L. (A. J. E.)

SPEKE, JOHN CANNING (1827-1864), an eminent African explorer, who was the first European to cross Central Africa from north to south and to determine the existence and position of the great water basin from which the Nile proper issues full formed. He was born on 4th May 1827 at Jordans near Ilchester, in Somersetshire. Entering the Indian army in 1844, he served in Sir Colin Campbell's division in the Punjab campaigns, and gradually acquired no small repute both as a military officer and as a sportsman and naturalist. When on furlough Captain Speke often advanced into unexplored portions of the Himalayas, and even crossed the frontier into Tibet, but his attention was at an early date turned to the great problems not of Asiatic but of African geography, and in 1854 he commenced his brief and brilliant African career by an expedition along with Captain Burton into Somali land, the incidents of which are narrated in *What led to the Discovery of the Source of the Nile* (London, 1864). It was along with the same explorer that the expedition of 1857-59 was undertaken, in the course of which Captain Speke, leaving Captain Burton, unfortunately invalided, at Kazé, struck northwards and reached the shores of Lake Victoria Nyassa in the neighbourhood of a nullah, which he named Jordans after his birthplace. Convinced though he was that this lake belonged to the Nile system, he had no absolute proof to offer to the scepticism of his fellow-traveller and many stay-at-home geographers, until in 1863 he returned from another expedition along with Captain James Augustus Grant, in which he struck the Nile at its exit from the lake, and proved its identity with the river of Egypt by following it most of the way down. Captain Speke was expected to hold a public discussion with Captain Burton as to certain disputed points in the history of his discoveries at the British Association in Bath (1864), but on the very morning (15th September)

fixed for the tournament he was killed by the accidental discharge of his own gun as he was crossing a fence while out shooting

See Speke, *Journal of the Discovery of the Source of the Nile*, 2 vols, 1863, J A Grant, *A Walk across Africa*, 1864

SPENCER, JOHN CHARLES SPENCER, THIRD EARL (1782-1845), better known by his courtesy title of Lord Althorp, had the good fortune to be acquainted, through his father's official position in the ministries of Pitt and Grenville, with both Pitt and Fox, and to be the confidential ally, through his own sound judgment and political honesty, of the leaders of the Whig party immediately before and after the Reform Bill of 1832 His father, the second earl, was well versed in books His mother, the eldest daughter of Lord Lucan, was conspicuous in London society for her gaiety and brightness Their eldest son, John Charles, was born at Spencer House, London, on 30th May 1782, and sent to Harrow for his education when less than eight years old At school he was chiefly remarkable for his love of sports and for a shyness which accompanied him throughout life, but fortunately did not prevent him whilst at Harrow from forming two or three acquaintances which proved useful in parliamentary life In January 1800 he took up his residence at Trinity College, Cambridge, and for some time applied himself energetically to mathematical studies, but during the last year of his life at college he surrendered himself a captive to the pleasures of hunting and racing Almost immediately after taking the degree of M A, in June 1802, he set out on a Continental tour, which was cut short, after he had passed some months in the chief cities of Italy, by the renewal of war Through the influence of Pitt's Government he was returned to parliament for the borough of Okehampton in Devonshire in April 1804, and, although he vacated his seat in February 1806 to contest the university of Cambridge against Lord Henry Petty and Lord Palmerston (when he was hopelessly beaten), he was re-elected in the same month for Okehampton, and rewarded with the emoluments of a lord of the treasury At the general election in November 1806 the freeholders of Northamptonshire selected him as their representative, and he continued to sit for the county until he succeeded to the peerage His tastes were then, as ever, for country life, but his indignation at the duke of York's conduct at the Horse Guards led him to move a resolution of the House of Commons in 1809 for the duke's removal from his post For the next few years after this speech Lord Althorp occasionally spoke in debate and always on the side of Liberalism, but from 1813 to 1818 he rarely entered the doors of the House of Commons His absence was partly due to a feeling that it was hopeless to struggle against the will of the Tory ministry, but more particularly to his marriage on 14th April 1814 to Esther, only daughter of Richard Acklom of Wiseton Hall, Nottinghamshire In 1819, on his return to political life after the death of his wife, and for many years after that date, he pressed upon the attention of the House the necessity of establishing a more efficient bankruptcy court, and of expediting the recovery of small debts, and, although his name is not associated with the attainment of either of these objects, he saw both accomplished before 1825 During the greater part of the reign of George IV the Whigs lost their legitimate influence in the state from their want of cohesion, but this defect was soon remedied when Lord Althorp was chosen their leader in the Lower House, and his capacity for the position was proved by experience When Lord Grey's administration was formed at the close of 1830 the chancellorship of the exchequer combined with the leadership of the House of Commons was naturally entrusted to Lord Althorp, and to him more than to any other man, with the exception of the prime minister and the lord chancellor, may be attributed the success of the Government measures The budget, it is true, was a failure, but this misfortune was soon forgotten in the struggles over the Reform Bill The consideration of the preliminaries of this measure was assigned to four ministers, two in the cabinet and two outside that body, but their proposals were, after careful examination, approved or rejected by Lord Grey and Lord Althorp before they were brought under the notice of the cabinet When the Bill was ready for introduction to the House of Commons its principles were expounded by Lord John Russell, but from the commencement of the protracted discussion over its details he had the assistance of Lord Althorp, and after some weeks of incessant toil, which the physique of Lord John Russell could not sustain any longer, the whole responsibility was cast on Lord Althorp To combat the objections of three such pertinacious opponents as Croker, Sugden, and Wetherell required both skill and courage, and in Lord Althorp these qualities were found He was constantly on his legs, and on one evening he made as many as twenty speeches The Reform Bill was carried at last, and popular instinct was right in assigning to the leader of the House a credit only second to that earned by Lord John Russell After the dissolution the Whigs returned to power with augmented numbers, but differences soon showed themselves among both leaders and followers, and their majority crumbled away Their position was strengthened for a time by triumphantly carrying a new poor law Bill, and even their keenest critics would now allow that, had the Whig propositions on tithes and church-rates been carried into effect, many years of passionate controversy would have been spared The ministry of Lord Grey was shattered to pieces by difficulties over an Irish coercion Bill, in which O'Connell thought that he had been unfairly treated Although Lord Melbourne became premier (14th July 1834), the fortunes of the ministry rested on Lord Althorp's presence in the House of Commons The death of Lord Spencer on 10th November 1834 called his son to the Upper House, and William IV took advantage of this event to summon a Tory cabinet to his side The new Lord Spencer abandoned the cares of office and returned to country life with unalloyed delight. Often as he was urged by his political friends to come to their assistance, he rarely quitted the peaceful pleasures which he loved He died at Wiseton on 1st October 1845 The Whigs required, to carry the Reform Bill, a leader of unstained character, one to whom party spirit could not attach the suspicion of greed of office, and against Lord Althorp malevolence was powerless No stronger proof of his pre-eminence could be given than the oft-quoted saying of Lord Hardinge that one of Croker's ablest speeches was demolished by the simple statement of Lord Althorp that he had collected some figures which entirely refuted it, but had lost them The trust which the House put in him then was never wanting

SPENER, PHILIPP JAKOB (1635-1705), "the father of Pietism," was born 13th January 1635, at Rappoltsweiler in Upper Alsace He received his earliest education from his subsequent brother-in-law, Joachim Stoll, chaplain to the count of Rappoltstein, whose wife was Spener's godmother After a brief stay in the grammar-school of Colmar he entered the university of Strasburg in 1651 as a student of theology,—living there with an uncle, and holding quite aloof from the student-life of the place He devoted himself to philology, history, and philosophy, and won his degree of master (1653) by a disputation against the philosophy of Hobbes He then became private tutor to the princes Christian and Charles of the Palatinate, and lectured in the university on philology and history From 1659 to

1662 he visited the universities of Basel, Tübingen, and Geneva, and commenced the study of heraldry, which he pursued throughout his life. In Geneva especially his religious views and tendencies were turned in the direction of his subsequent Pietism. He returned to Strasburg in 1663 where he was appointed preacher without pastoral duties, with the right of holding lectures in the university. Three years afterwards he was invited to become the chief pastor in the Lutheran church at Frankfort-on-the-Main. He had previously married a lady of his mother's choice, who made him an excellent wife and bore him eleven children. Immediately after his removal to Frankfort he commenced that line of pastoral work which issued in the movement called PIETISM (*q.v.*). In 1686 he accepted the invitation to the first court chaplaincy at Dresden. But the elector John George III., at whose personal desire the post had been offered to him, was soon offended at the fearless conscientiousness with which his chaplain sought to discharge his pastoral duties; and the opposition of the Saxon university of Leipsic to the Pietistic movement and to Spener personally served to render the chaplain more decidedly a *persona ingrata* to the elector. Spener refused to resign his post, and the Saxon Government hesitated to dismiss him. But in 1691 the Saxon representative at Berlin induced the court of Brandenburg to offer him the rectorship of St Nicolas in Berlin with the title of "consistorialrath." In Berlin Spener was held in high honour, though the tendencies of the court and the Government officials were rather rationalistic than pietistic. One of the most important works of this period of his life was the foundation of the university of Halle (1691), which he directed. All his life long Spener had been exposed to the incessant attacks and abuse of the orthodox Lutheran theologians, who generally charged him with the errors in doctrine and extravagances in practice of followers who had borrowed from him everything rather than his wisdom and caution. With his years his opponents multiplied, and the movement which he had inaugurated presented increasingly matter for hostile criticism. In 1695 the theological faculty of Wittenberg formally laid to his charge 264 errors, and only his death (5th February 1705) released him from these fierce conflicts.

Though Spener has been justly called "the father of Pietism," hardly any of the errors and none of the extravagances of the movement can be ascribed to him personally. So far was he from sharing them that Ritschl maintains (ii. p. 163) that "he was himself not a Pietist," as he did not advocate the quietistic, legalistic, and semi-separatist practices of Pietism, though they were more or less involved in the positions he assumed or the practices which he encouraged or connived at. The only two points on which he departed from the orthodox Lutheran faith of his day were the requirement of regeneration as the *sine qua non* of the true theologian, and the expectation of the conversion of the Jews and the fall of Papacy as the prelude of the triumph of the church. He did not, like the later Pietists, insist on the necessity of a conscious crisis of conversion, nor did he encourage a complete breach between the Christian and the secular life.

Spener was a voluminous writer. The list of his published works comprises 7 vols. folio, 63 quarto, 7 octavo, 46 duodecimo; and in one year he had answered 622 and had still to answer 300 letters. The most important of his works for their bearing on his history are *Theologische Bedenken*, in 4 parts, Halle, 1700-1702; *Letzte theologische Bedenken*, with a life of Spener by Canstein, Halle, 1711; *Concilia et judicia theologica Latina* (posthumous), Frankfort, 1709.

SPENNYMOOR, a market town of Durham, England, is situated on the Ferryhill and Bishop Auckland branch of the North-Eastern Railway, 3½ miles north-west of Ferryhill and 6 south of Durham by road. Within recent years it has increased with great rapidity owing to the production of coal and iron, and in 1865 it was formed into a market town under a local board of health. It possesses a town-hall, a mechanics' institute and reading room, and two market halls. A school board was formed in 1875. The population of the urban sanitary district (area 176 acres) in 1871 was 4627, and in 1881 it was 5917.

SPENSER, EDMUND (c. 1552-1599), Elizabethan poet, was born in London about the year 1552. The received date of his birth rests on a passage in sonnet lx. of the *Amoretti*. He speaks there of having lived forty-one years; the *Amoretti* was published in 1595, and described on the title-page as "written not long since"; this would make the year of his birth 1552 or 1553. We know from the *Prothalamion* that London was his birthplace. This at least seems the most natural interpretation of the words—

"Merry London, my most kindly nurse,
That to me gave this life's first native source."

It would appear from a recent discovery by Mr R. B. Knowles[1] that the relationship of the poet to the noble family of Spencer, if it existed at all—and official names such as Spenser (Dispenser) or Stewart (Steward) carry no proof of consanguinity—was remote, and that the poet's kinsmen must be sought among the humbler Spensers of north-east Lancashire. Robert Nowell, a London citizen, left a sum of money to be distributed in various charities, and in the account-books of his executors Mr Knowles has discovered among the names of other beneficiaries "Edmund Spensore, scholar of the Merchant Taylor School, at his going to Pembroke Hall in Cambridge." The date of this benefaction is 28th April 1569. As the poet is known to have been a sizar of Pembroke, the identification is beyond dispute. Till this discovery it was not known where Spenser received his school education. The speculations as to the poet's parentage started by the Nowell MS. are naturally more uncertain. Mr Knowles found three Spensers in the books of the Merchant Taylors, and concluded that the poorest of them, John Spenser, a "free journeyman" in the "art or mystery of clothmaking," might have been the poet's father, but he afterwards abandoned this theory. Mr Grosart, however, adheres to it, and gives a confident solution of Mr Knowles's difficulties. Nothing approaching certainty can be reached on the point, which is not itself of much importance. The connexion of Spenser with Lancashire is also supported by the Nowell MS. Several Spensers of that county appear among the "poor kinsfolk" who profited by Nowell's bounty.

It is natural that a poet so steeped in poetry as Spenser should show his faculty at a very early age; and there is strong reason to believe that verses from his pen were published just as he left school at the age of sixteen or seventeen. Certain pieces, translations from Du Bellay and Petrarch, afterwards included in a volume of poems by Spenser published in 1591, are found in a miscellany, *Theatre for Worldings*, issued by a Flemish Protestant refugee, John van der Noodt, on the 25th of May 1569. The translations from Du Bellay appear in blank verse in the miscellany, and are rhymed in sonnet form in the later publication, but the diction is substantially the same; the translations from Petrarch are republished with slight variations. Poets were so careless of their rights in those days and publishers took such liberties that we cannot draw for certain the conclusion that would be inevitable if the facts were of more modern date; but the probabilities are that these passages in Van der Noodt's *Theatre*, although the editor makes no acknowledgment, were contributed by the schoolboy Spenser. As the exercises of a schoolboy writing before our poetic diction was enriched by the great Elizabethans, they are remarkable for a sustained command of expression which many schoolboys might ex-

hibit in translation now, but which was a rarer and more significant accomplishment when Surrey and Sackville were the highest models in post-Chaucerian English

Little is known of Spenser's Cambridge career, except that he was a sizar of Pembroke Hall, took his bachelor's degree in 1572, his master's in 1576, and left Cambridge without having obtained a fellowship Mr Grosart's inquiries have elicited the fact that his health was not good,—college allowances while he was in residence being often paid "Spenser ægrotanti" One of the fellows of Pembroke strongly influenced his destiny This was Gabriel Harvey, a prominent figure in the university life of the time, an enthusiastic educationist, vigorous, versatile, not a little vain of his own culture and literary powers, which had gained him a certain standing in London society The revival and advancement of English literature was a passion of the time, and Harvey was fully possessed by it His fancy for reforming English verse by discarding rhyme and substituting unrhymed classical metres, and the tone of his controversy with Thomas Nash, have caused him to be regarded as merely an obstreperous and pragmatic pedant, but it is clear that Spenser, who had sense enough not to be led astray by his eccentricities, received active and generous help from him and probably not a little literary stimulus Harvey's letters to Spenser[1] throw a very kindly light on his character

Three years after leaving Cambridge, in 1579, Spenser issued his first volume of poetry, the *Shepherd's Calendar* Where and how he spent the interval have formed subjects for elaborate speculation That most of it was spent in the study of his art we may take for granted That he lived for a time in the "north parts" of England, that there or elsewhere he fell in love with a lady whom he celebrates under the anagram of "Rosalind", that his friend Harvey urged him to return south, and introduced him to Sir Philip Sidney, that Sidney took to him, discussed poetry with him, introduced him at court, put him in the way of preferment,—are ascertained facts in his personal history Mr Grosart conjectures with considerable plausibility that he was in Ireland in 1577 in the service of Sir Henry Sidney, Philip's father, and returned to England with that administrator in 1578

The interest of the *Shepherd's Calendar* is mainly personal to Spenser Its twelve poems continue to be read chiefly because they were the first published essays of the author of the *Faery Queen*, the poems in which he tried and disciplined his powers They mark no stage in the history of pastoral poetry Spenser had too strong a genius not to make his own individuality felt in any form that he attempted, and his buoyant dexterity in handling various schemes of verse must always afford delight to the connoisseur in such things But a reader not already interested in Spenser, or not already familiar with the artificial eclogue, would find little to attract him in the *Shepherd's Calendar* The poems need a special education, given this, they are felt to be full of charm and power, a fresh and vivid spring to the splendid summer of the *Faery Queen* The diction is a studiously archaic artificial compound, partly Chaucerian, partly North Anglian, partly factitious, and the pastoral scenery is such as may be found in any country where there are sheep, hills, trees, shrubs, toadstools, and running streams That Spenser, having been in the north of England, should have introduced here and there a touch of north country colour is natural enough, but it is not sufficient to give a character to the poems as pastoral poems As such they follow continuously and do not violently break away from Latin, Italian, and French predecessors, and Mr George Saintsbury is undoubtedly right in indicating Marot as the most immediate model At the same time one can quite understand on historical grounds why the *Shepherd's Calendar* was hailed with enthusiasm as the advent of a "new poet" Not only was it a complete work in a form then new to English literature, but the execution showed the hand of a master There had been nothing so finished, so sustained, so masterful in grasp, so brilliant in metre and phrase, since Chaucer It was felt at once that the poet for whom the age had been waiting had come The little coterie of friends whose admiration the young poet had won in private were evidently concerned lest the wider public should be bewildered and repelled by the unfamiliar pastoral form and rustic diction To put the public at the right point of view the poems were published with a commentary by "E K,"—supposed to be one Edward Kirke, who was an undergraduate with Spenser at Pembroke This so-called "glosse" explained the archaic words, revealed the poet's intentions, and boasted that, as in the case of Virgil, the pastoral poetry of the "new poet" was but "a proving of the wings for higher and wider flights" The "new poet's" name was withheld, and the identification of the various "shepherds"—of Cuddie and Roffy and Diggon Davie, and the beauteous golden-haired "widow's daughter of the glen"—was fortunately reserved to yield delight to the ingenious curiosity of a later age

The *Shepherd's Calendar* was published at Gabriel Harvey's instance, and was dedicated to Sir Philip Sidney It was one out of many poetical schemes on which the young poet was busy in the flush of conscious power and high hopes excited by the admiration of the literary authorities whose approval was then most to be coveted His letters to Harvey and Harvey's letters to him furnish hints for a very engaging fancy picture of Spenser at this stage of his life,—looking at the world through rose-coloured spectacles, high in favour with Sidney and Leicester, dating his letters from Leicester House, gaily and energetically discussing the technicalities of his art, with some provision from his powerful friends—certain, but the form of it delightfully uncertain,—going to court in the train of Leicester, growing pointed beard and mustachios of fashionable shape, and frightening his ever-vigilant friend and mentor Harvey by the light courtier like tone of his references to women The studious pastoral poet from "north parts" had blossomed with surprising rapidity in the image of the gay fortune-seeking adventurers who crowded the court of the virgin queen in those stirring times Some of the poems which he mentions to Harvey as then completed or on the anvil—his *Dreams*, his *Nine Comedies*, his *Dying Pelican*, and his *Stemmata Dudleiana* (singing the praises of the noble family which was befriending him)—have not been preserved, at least in any form that can be certainly identified He had sent Harvey a portion of the *Faery Queen*, which he was eager to continue, but Harvey did not think much of it—a judgment for which Harvey is often ridiculed as a dull pedant, as if we knew for certain that what was submitted to him was identical with what was published ten years later

Spenser was appointed secretary to the lord-deputy of Ireland in 1580, and was one of the band of adventurers who, with mixed motives of love of excitement, patriotism, piety, and hopes of forfeited estates, accompanied Lord Arthur Grey of Wilton to Ireland to aid in the suppression of Desmond's rebellion Regret is sometimes expressed that the author of the *Faery Queen*, who ought to have been dreamy, meditative, gentle, and refined, should have been found in such company, and should have taken part in the violent and bloody scenes of Lord Grey's two years' attempt at "pacification" But such things must be judged with reference to the circumstances and the spirit of the time, and it must be remembered that England was then engaged in a fierce struggle for existence against the Catholic powers of the Continent Of Lord Grey's character his secretary was an enthusiastic admirer, exhibiting him in the *Faery Queen* as Arthegal, the personification of justice, and we know exactly what were his own views of Irish policy, and how strongly he deplored that Lord Grey was not permitted to carry them out Spenser's *View of the State of Ireland*, drawn up after fourteen years' experience, is not the work of a gentle dreamer, but of an energetic and shrewd public official

The *View* is not a descriptive work, there is nothing in the style to indicate that it was written by a poet, it is an elaborate state paper, the exposition in the form of a dialogue of a minutely considered plan for the pacification of Ireland, written out of zeal for the public service for the eyes of the Government of the day A very thoroughgoing plan it is After passing in review the history and character of the Irish, their laws, customs, religion, habits of life, armour, dress, social institutions, and finding "evil usages" in every department, he propounds his plan of "reformation" Reformation can be effected only by the sword, by the strong hand The interlocutor in the dialogue holds up his hands in horror Does he propose extermination? By no means; but he would give the Irish a choice between submission and extermination The Government had vacillated too long, and, fearing the cost of a thorough operation, had spent twice as much without

in any way mending matters Let them send into Ireland 10,000 foot and 1000 horse, disperse them in garrisons—a complete scheme of localities is submitted,—give the Irish twenty days to come in, if they did not come in then, give no quarter afterwards, but hunt them down like wild beasts in the winter time when the covert is thin, "if they be well followed one winter, ye shall have little work to do with them the next summer", famine would complete the work of the sword, and in eighteen months' time peace would be restored and the ground cleared for plantation by English colonists There must be no flinching in the execution of this plan,—"no remorse or drawing back for the sight of any such rueful object as must thereupon follow, nor for compassion of their calamities, seeing that by no other means it is possible to recover them, and that these are not of will but of very urgent necessity" The Government had out of foolish compassion drawn back before when Lord Grey had brought the recalcitrant Irish to the necessary extremity of famine, the gentle poet warns them earnestly against a repetition of the blunder

Such was Spenser's plan for the pacification of Ireland, propounded not on his own authority, but as having support in "the consultations and actions of very wise governors and counsellors, whom he had sometimes heard treat thereof" He knew that it was "bloody and cruel", but he contended passionately that it was necessary for the maintenance of English power and the Protestant religion Commentary on the plan, which has been so much and so warmly discussed, would be out of place here The method was repugnant to the kindly nature of average Englishmen, from the time of Lord Grey no English authority had the heart to go through with it till another remorseless zealot appeared in the person of Cromwell That Cromwell knew the treatise of "the sage and serious Spenser," perhaps through Milton, is probable from the fact that the poet's Irish estates were secured to his grandson by the Protector's intervention in 1657 These estates had been granted to Spenser as his share in the redistribution of Munster,—3000 acres of land and Kilcolman castle, an ancient seat of the Desmonds, in the north of the county of Cork The elaborate and business-like character of the *View* shows that the poet was no sinecurist, but received his reward for substantial political services He ceased to be secretary to the lord-deputy when Lord Grey was recalled in 1582, but he continued in the public service, and in 1586 was promoted to the onerous position of clerk to the council of Munster

Amidst all the distractions of his public life in Ireland, Spenser seems to have proceeded steadily with the composition of the *Faery Queen*, translating his varied experience of men and affairs into the picturesque forms of his allegory, and expressing through them his conception of the immutable principles that ought to regulate human conduct He had, as we have seen, conceived a work of the kind and made a beginning before he left England The conception must have been very much deepened and widened and in every way enriched by his intimate daily contact with the actual struggle of conflicting individuals and interests and policies in a great crisis Some four or five years later, being asked in a mixed company of English officials in Ireland (as recorded in Lodowick Bryskett's *Discourse of Civil Life*) to give offhand a short sketch of "the ethical part of moral philosophy" and the practical uses of the study, Spenser explained to these simple-minded men that the subject was too intricate for an impromptu exposition, but that he had in hand a work called the *Faery Queen* in which an ethical system would be exhibited in action The respect paid by his official brethren to Spenser as a man, "not only perfect in the Greek tongue, but also very well read in philosophy, both moral and natural," is an interesting item in his biography Some years later still, when Spenser was settled at Kilcolman castle, Sir Walter Raleigh found him with three books of the *Faery Queen* completed, and urged him to come with them to London London accordingly he revisited in 1589, after nine years' absence There is a very pretty record of this visit in *Colin Clout's Come Home Again*, published in 1595, but written in 1591, immediately after his return to Kilcolman The incidents of the visit, by that time matters of wistful memory, are imaged as a shepherd's excursion from his quiet pastoral life into the great world Colin Clout calls round him once again the masked figures of the *Shepherd's Calendar*, and describes to them what he saw, how he fared, and whom he met at the court of Cynthia, and how through the influence of "the Shepherd of the Ocean" he was admitted at timely hours to play on his oaten pipe in the great queen's presence

How much is pure fiction and how much veiled fact in this picture cannot now be distinguished, but it is undoubted that Spenser, though his chief patrons Leicester and Sidney were now dead, was very graciously received by the great world on his return to London Not only did the queen grant him an audience, but many ladies of the court, several of whom he afterwards honoured with dedications, honoured him with their patronage The first three books of the *Faery Queen*, which were entered at Stationers' Hall on the 1st December 1589, were published in 1590, and he was proclaimed at once with remarkable unanimity by all the writers of the time as the first of living poets

From the first week of its publication the literary world has continued unanimous about the *Faery Queen*, except on minor points None of our great poets has been welcomed with such universal acclaim and upheld without loss of favour through so many changes of fashion When romanticism was at its lowest ebb Pope read Spenser in his old age with as much delight as in his boyhood He speaks himself of having had his detractors, of having suffered from the venomous tooth of the Blatant Beast, and he seems to have had in more than ordinary share the poet's sensitiveness to criticism, but the detractors or indifferentists have generally been found among men who, like the lord high treasurer Burghley, have no liking for poetry of any kind The secret of Spenser's enduring popularity with poets and lovers of poetry lies specially in this that he excels in the poet's peculiar gift, the instinct for verbal music Shakespeare, or the author of the sonnet usually assigned to him, felt and expressed this when he drew the parallel between "music and sweet poetry"—

> "Thou lovest to hear the sweet melodious sound
> That Phœbus' lute, the queen of music, makes,
> And I in deep delight am chiefly drowned
> Whenas himself to singing he betakes"

This is an early word in criticism of Spenser, and it is the last word about his prime and unquestionable excellence,—a word in which all critics must agree Whether he had imagination in the highest degree or only luxuriant fancy, and whether he could tell a story in the highest epic manner or only put together a richly varied series of picturesque incidents, are disputable points, but about the enchantment of his verse there can be no difference of opinion It matters not in the least that he gains his melody often by archaic affectations, licences of diction that should make Dr Richard Morris "stare and gasp", there, however purchased, the marvellously rich music is In judging of the structure of the *Faery Queen* we must always remember that, long and diffuse as it is, what we have is but a fragment of the poet's design, and that the narrative is regulated by an allegorical purpose, but, however intricate, however confused, the reader may feel the succession of incidents to be, when he studies the succession of incidents, it is only at the call of duty that he is likely to occupy himself with such a study in reading Spenser

The ethical value of the allegory has been very variously estimated The world would probably never have divined that there was any allegory if he had not himself drawn attention to it in a prose dedication and in doggerel headings to the cantos It was apparently at his friend Raleigh's suggestion that the poet condescended to explain his ethical purpose, otherwise it would have been as problematical as the similar intention in the case of the *Idyls of the King* before that intention was expressly declared It is almost to be regretted, as far as the allegory is concerned, that the friendly "E K" was not employed to furnish a "glosse" to the *Faery Queen* as he had done to the *Shepherd's Calendar* Undoubtedly the peculiar "poetic luxury" of the *Faery Queen* can be enjoyed without any reference to the allegory, even Professor Dowden, the most eloquent champion of Spenser's claims as a "teacher," admits that it is a mistake to look for minute correspondence between outward symbol and underlying sense, and that the poet is least enjoyable where he is most ingenious Still the

allegory governs the structure of the poem, and Spenser himself attached great importance to it as determining his position among poets The ethical purpose is distinctive of the poem as a whole, it was foremost in Spenser's mind when he conceived the scheme of the poem, and present with him as he built up and articulated the skeleton, it was in this respect that he claimed to have "overpassed" his avowed models Ariosto and Tasso If we wish to get an idea of Spenser's imaginative force and abundance, or to see his creations as he saw them, we must not neglect the allegory It is obvious from all that he says of his own work that in his eyes the ethical meaning not only heightened the interest of the marvellously rich pageant of heroes and heroines, enchanters and monsters, but was the one thing that redeemed it from romantic commonplace For the right appreciation of many of the characters and incidents a knowledge of the allegory is indispensable For example, the slaughter of Error by the Red Cross knight would be merely disgusting but for its symbolic character, the iron Talus and his iron flail is a revolting and brutally cruel monster if he is not regarded as an image of the executioner of righteous law, the Blatant Beast, a purely grotesque and ridiculous monster to outward view, acquires a serious interest when he is known to be an impersonation of malignant detraction

After the publication of the *Faery Queen* Spenser seems to have remained in London for more than a year, to enjoy his triumph It might be supposed, from what he makes the Shepherd of the Ocean say in urging Colin Clout to quit his banishment in Ireland, that Raleigh had encouraged him to expect some permanent provision in London If he had any such hopes they were disappointed The thrifty queen granted him a pension of £50, which was paid in February 1591, but nothing further was done for him Colin Clout's explanation that the selfish scrambling and intriguing of court life were not suited to a lowly shepherd swain, and that he returned to country life with relief, may be pastoral convention, or it may have been an expression of the poet's real feelings on his return to Kilcolman, although as a matter of fact there seems to have been as much scrambling for good things in Munster as in London Certain it is that he did return to Kilcolman in the course of the year 1591, having probably first arranged for the publication of *Daphnaida* and *Complaints* *Daphnaida* is a pastoral elegy on the death of the niece of the mistress of the robes The fact implied in the dedication that he was not personally known to the lady has more than once provoked the solemn remark that the poet's grief was assumed Of course it was assumed, and it is hardly less obvious that sincerity of personal emotion, so far from being a merit in the artificial forms of pastoral poetry, the essence of which lies in its dreamy remoteness from real life, would be a blemish and a discord Any suggestion of the poet's real personality breaks the charm, once raise the question of the poet's personal sincerity and the pastoral poem may at once be thrown aside The remark applies to all Spenser's minor poetry, including his love-sonnets, the reader who raises the question whether Spenser really loved his mistress may have a talent for disputation but none for the full enjoyment of hyperbolical poetry *Complaints*, also published in 1591, is a miscellaneous collection of poems written at different periods The volume contained *The Ruins of Time*, *The Tears of the Muses*, *Virgil's Gnat*, *Mother Hubbard's Tale*, *The Ruins of Rome*, *Muiopotmos*, *Visions of the World's Vanity*, *Bellay's Visions*, *Petrarch's Visions* Some of these pieces are translations already alluded to and interesting only as the exercises of one of our greatest masters of melodious verse, but two of them, *The Tears of the Muses* and *Mother Hubbard's Tale*, have greater intrinsic interest The first is the complaint of the decay of learning alluded to in *Midsummer Night's Dream*, v 1, 52—

> "The thrice three Muses mourning for the death
> Of Learning late deceased in beggary"

The lament, at a time when the Elizabethan drama was "mewing its mighty youth," was not so happy as some of Spenser's political prophecies in his *View of Ireland*, but it is idle work to try to trace the undercurrents and personal allusions in such an occasional pamphlet. *Mother Hubbard's Tale*, a fable in Chaucerian couplets, shows a keenness of satiric force not to be paralleled in any other of Spenser's writings, and suggests that he left the court in a mood very different from Colin Clout's

Spenser returned to London probably in 1595 He had married in the interval a lady whose Christian name was Elizabeth,—Mr Grosart says Elizabeth Boyle The marriage, celebrated on the 11th of June 1594, was followed by a rapid succession of publications The first was a volume (entered at Stationers' Hall, 19th November 1594, published 1595) containing the *Amoretti*, a series of exquisite sonnets commemorative of the moods and incidents of his courtship, and the magnificent *Epithalamion*, incomparably the finest of his minor poems As in the case of the *Complaints*, the publisher for obvious reasons issued this volume nominally without his authority *Colin Clout's Come Home Again* was published in the same year, with a dedication to Sir Walter Raleigh, dated 1591 Early in 1596 the second three books of the *Faery Queen* were entered in the register of Stationers' Hall, and in the course of the same year were published his *Four Hymns*, his *Prothalamion*, and his *Astrophel*, a pastoral lament for Sir Philip Sidney, which he dedicated to the countess of Essex

That Spenser wrote more of the *Faery Queen* during the last two years of his life, and that the MS perished in the sack of Kilcolman castle by the rebels, may plausibly be conjectured, but cannot be ascertained During those years he would seem to have been largely occupied with political and personal cares He describes himself in the *Prothalamion* as a disappointed suitor at court He drew up his *View of Ireland* in 1596 when he was in London, and from various circumstances it is evident that he had hopes of some kind from the favour of Essex The *View*, with its urgent entreaty that Essex should be sent to Ireland, was entered at Stationers' Hall in April 1598, but he did not obtain leave to publish it Burghley, who had long stood in his way, died in August of that year, and next month Spenser was appointed sheriff of Cork In October Tyrone's rebellion broke out, and Spenser's house was sacked and burned The poet himself escaped, and in December was sent to London with despatches Again he ventured to urge upon the queen his plan for the thorough "reformation" of Ireland But his own end was near On 16th January 1599 he died at Westminster, ruined in fortune, if not heart-broken, and was buried in Westminster Abbey, near his master Chaucer

There have been many editions of Spenser's works The most available and complete is the Globe edition, with a carefully edited text by Dr R Morris, and a memoir by Professor J W Hales Mr Grosart's edition, with its keenly argumentative biography and copious collection of variorum researches and critical opinions, is printed for private circulation (W M)

SPERMACETI is a solid waxy body found in special cavities in the head of the sperm whale (*Physeter macrocephalus*), where it is held in solution by sperm oil while the creature is in life At a temperature of about 6° C the solid matter separates in a crystalline condition, and when purified by pressure and treatment with weak solution of caustic alkali it forms brilliant white crystalline scales or plates, hard but unctuous to the touch, and destitute of taste or smell It is quite insoluble in water, very slightly affected by boiling alcohol, but easily dissolved in ether, chloroform, and carbon bisulphide. Spermaceti consists principally of cetin or cetyl palmitate, $\left.\begin{matrix}C_{16}H_{31}O\\C_{16}H_{33}\end{matrix}\right\}O$, —an ether composed of cetyl alcohol combined with palmitic acid Spermaceti candles of definite size are employed

as a standard for illuminants on account of the uniform steady light they afford. The substance is further used in the dressing of fabrics and in medicine and surgery, especially in cerates, bougies, ointments, and in cosmetic preparations. For sperm oil, see WHALE OILS.

SPEUSIPPUS, son of Eurymedon and Potone, is supposed to have been born about 407 B.C. He was bred in the school of Isocrates, but, when his maternal uncle, Plato, returned to Athens about 387, he yielded to his influence and became a member of the Academy. In 361, when Plato undertook his third and last journey to Sicily, Speusippus accompanied him. In 347 the dying philosopher nominated his nephew to succeed him as scholarch, and the choice was ratified by the school. Speusippus held the office for eight years, and died in 339 after a paralytic seizure. According to some authorities he committed suicide. There is a story that his youth was riotous, until Plato's example led him to reform his ways. In later life he was conspicuously temperate and amiable. He was succeeded by Xenocrates.

Of Speusippus's many philosophical writings nothing survives except a fragment of a treatise *On Pythagorean Numbers*. Nor have secondary authorities preserved to us any general statement or conspectus of his system. Incidentally, however, we learn the following details. (A) In regard to his theory of being,—(1) whereas Plato postulated as the basis of his system a cause which should be at once Unity, Good, and Mind, Speusippus distinguished Unity, the origin of things, from Good, their end, and both Unity and Good from controlling Mind or Reason; (2) whereas Plato recognized three kinds of numbers—firstly, ideal numbers, the formal causes of the ideas; secondly, mathematical numbers, the abstractions of mathematics; and thirdly, sensible numbers, numbers embodied in things—Speusippus rejected the ideal numbers, and consequently the ideas; (3) Speusippus traced number, magnitude, and soul each to a distinct principle of its own. (B) In regard to his theory of knowledge,—(4) he held that a thing cannot be known apart from the knowledge of all things besides; for, that we may know what a thing is, we must know how it differs from other things, which other things must therefore be known; (5) accordingly, in the ten books of a work called Ὅμοια, he attempted a classification of plants and animals; (6) the results thus obtained he distinguished at once from "knowledge" (*ἐπιστήμη*) and from "sensation" (*αἴσθησις*), holding that "scientific observation" (*ἐπιστημονικὴ αἴσθησις*), though it cannot attain to truth, may nevertheless, in virtue of a certain acquired tact, frame "definitions" (*λόγοι*). (C) In regard to his theory of ethics,—(7) he denied that pleasure was a good, but seemingly was not prepared to account it an evil.

In default of direct evidence, it remains for us to compare these scattered notices of Speusippus's teaching with what we know of its original, the teaching of Plato, in the hope of obtaining at least a general notion, firstly, of Speusippus's system, and, secondly, of its relations to the systems of Plato, of contemporary Platonists, such as Aristotle, and of the later Academy.

It has been suggested elsewhere (SOCRATES, p. 238 *supra*) that the crude and unqualified "realism" of Plato's early manhood gave place in his later years to a theory of natural kinds founded upon a "thoroughgoing idealism," and that in this way he was led to recognize and to value the classificatory sciences of zoology and botany. More exactly, it may be said that the Platonism of Plato's maturity included the following principal doctrines:—(i.) the supreme cause of all existence is the One, the Good, Mind, which evolves itself as the universe under certain eternal immutable forms called "ideas"; (ii.) the ideas are apprehended by finite minds as particulars in space and time, and are then called "things"; (iii.) consequently the particulars which have in a given idea at once their origin, their being, and their perfection may be regarded, for the purposes of scientific study, as members of a natural kind; (iv.) the finite mind, though it cannot directly apprehend the idea, may, by the study of the particulars in which the idea is revealed, attain to an approximate notion of it.

Now when Speusippus (1) discriminated the One, the Good, and Mind, (2) denied the ideas, and (3) abandoned the attempt to unify the plurality of things, he explicitly rejected the theory of being expressed in (i.) and (ii.); and the rejection of the theory of being, *i.e.*, of the conception of the One evolving itself as a plurality of ideas, entailed consequential modifications in the theory of knowledge conveyed in (iii.) and (iv.). For, if the members of a natural kind had no common idea to unite them, scientific research, having nothing objective in view, could at best afford a *λόγος* or definition of the appropriate particulars; and, as the discrimination of the One and the Good implied the progression of particulars towards perfection, such a *λόγος* or definition could have only a temporary value. Hence, though, like Plato, Speusippus (4) studied the differences of natural products (5) with a view to classification, he did not agree with Plato in his conception of the significance of the results thus obtained; that is to say, while to Plato the definition derived from the study of the particulars included in a natural kind was an approximate definition of the idea in which the natural kind originated, to Speusippus the definition was a definition of the particulars studied, and, strictly speaking, of nothing else. Thus, while Plato hoped to ascend through classificatory science to the knowledge of eternal and immutable laws of thought and being, Speusippus, abandoning ontological speculation, was content to regard classificatory science not as a means but as an end, and (6) to rest in the results of scientific observation. In a word, Speusippus turned from philosophy to science.

It may seem strange that, differing thus widely from his master, Speusippus should have regarded himself and should have been regarded by others as a Platonist, and still more strange that Plato should have chosen him to be his successor. It is to be observed, however, firstly, that the scientific element occupied a larger place in Plato's later system than is generally supposed,[1] and, secondly, that the only Academics who came into competition with Speusippus agreed with him in his rejection of the theory of ideas. Hence Plato, finding in the school no capable representative of his ontological theory, might well choose to succeed him a favourite pupil whose scientific enthusiasm and attainment were beyond question; and Speusippus's rivals, having themselves abandoned the theory of ideas, would not be in a position to tax him with his philosophical apostasy.

In abandoning the theory of ideas—that is to say, the theory of figures and numbers, the possessions of universal mind, eternally existent out of space and time, which figures and numbers when they pass into space and time as the heritage of finite minds are regarded as things—Speusippus had the approval, as of the Platonists generally, so also of Aristotle. But, whereas the new scholarch, confining himself to the detailed examination of natural kinds, attempted no comprehensive explanation of the universe, Aristotle held that a theory of its origin, its motions,

[1] That Plato did not neglect, but rather encouraged, classificatory science is shown, not only by a well-known fragment of the comic poet Epicrates, which describes a party of Academics engaged in investigating, under the eye of Plato, the affinities of the common pumpkin, but also by the *Timæus*, which, while it carefully discriminates science from ontology, plainly recognizes the importance of the study of natural kinds.

and its order was a necessary adjunct to the classificatory sciences; and in nearly all his references to Speusippus he insists upon this fundamental difference of procedure. Conceiving that the motions of the universe and its parts are due to the desire which it and they feel towards the supreme external mind, so that the cosmical order is initial in the divine mind, final in the phenomenal universe, Aristotle supposes himself thus to secure the requisite unification of the variety of things. Contrariwise, when Speusippus distinguishes One, Good, and Mind, so that Mind, not as yet endowed with an orderly scheme, adapts the initial One to a variety of particular Goods, his theory of nature appears to his rival "episodical," *i.e.*, to consist of a series of tableaux wanting in dramatic unity, so that it reminds him of Homer's line—*οὐκ ἀγαθὸν πολυκοιρανίη εἷς κοίρανος ἔστω*. The theory propounded by Aristotle himself is not perhaps impeccable in this respect, but at any rate he does not, like Speusippus, despair of a solution of the traditional problem of the One and the Many.

Speusippus and his contemporaries in the school exercised an important and far-reaching influence upon Academic doctrine. When they, the immediate successors of Plato, rejected their master's ontology and proposed to themselves as ends mere classificatory sciences which with him had been means, they bartered their hope of philosophic certainty for the tentative and provisional results of scientific experience. Xenocrates indeed, identifying ideal and mathematical numbers, sought to shelter himself under the authority of Plato; but, as the Xenocratean numbers, though professedly ideal as well as mathematical, were in fact mathematical only, this return to the Platonic terminology was no more than an empty form. It would seem, then, that Academic scepticism began with those who had been reared by Plato himself, having its origin in their acceptance of the scientific element of his teaching apart from the ontology which had been its basis. In this way, and, so far as the present writer can see, in this way only, it is possible to understand the extraordinary revolution which converted Platonism, philosophical and dogmatic, into Academicism, scientific and sceptical. It is as the official representative of this scientific and sceptical departure that Speusippus is entitled to a place in the history of philosophy.

SPEY, a river in the north of Scotland, rises in the south-east of Inverness-shire from a small tarn called Loch Spey, 5 miles east of the Caledonian Canal, and flows north-eastwards by Kingussie to Grantown in Elginshire, 10 miles below which it reaches Banffshire. After forming for about 15 miles the boundary between Elginshire and Banffshire, it again enters the former county, through which it flows for about 10 miles past Fochabers to the Moray Firth. In the earlier part of its course it is fed by a large number of mountain streams, its principal tributaries being, in Inverness-shire, the Tromie and the Feshie from the right and the Dulnain from the left, and on the boundaries of Banff and Elgin the Avon (Aven) and the Fiddich from the right. Its entire length is 96 miles, and it drains an area of about 1200 square miles. The flow of the river is very rapid, and, being fed largely by mountain streams, it is subject to sudden freshets, which sometimes occasion extensive floods, the greatest being that of 1829. The Spey is, next to the Tay and the Tweed, the most important salmon river in Scotland. The scenery in its upper courses is occasionally bare and bleak, but sometimes finely picturesque, especially where, as in Elginshire and Banffshire, its bold and rocky banks are clothed by forests of birch and pine.

See L. Shaw, *History of the Province of Moray* (1st ed. 1775, 3d ed. 1882), and Sir Thomas Dick Lauder, *Account of the Moray Floods* (1st ed. 1830, 4th ed. 1873).

SPEZIA, a city of Italy, in the province of Genoa, 56 miles south-east of Genoa by the railway to Pisa, which has become since the unification of the kingdom one of the principal Italian ports and the seat of a great Government arsenal. It is situated at the north-west angle of the Gulf of Spezia, formerly known as Lunæ Portus, the western side of which is formed by a rocky promontory about 4 miles long, terminating in the picturesque little town of Portovenere and the islands of Palmaria and Tino. A great breakwater, constructed about 1860, stretches across the gulf from Santa Maria Point to Santa Teresa Point for a distance of 7220 feet; and the outer harbour to the south-west of the town, excavated in 1865 to a depth of 32 feet, has an area of 247 acres. The arsenal has a length of 3937 feet and an average breadth of 2460 feet. The first dock covers an area of 20 acres and the second 17 acres; and there are besides two careening basins, 433 and 354 feet long. Farther south lie the extensive military establishments of San Vito, with storehouses, reservoir, &c.; and almost right opposite, on the other side of the gulf, are the dock ($1\frac{1}{2}$ acres), shipbuilding yards, and repairing docks of San Bartolomeo. Some of the largest vessels of the Italian navy have been constructed at Spezia. As a commercial centre Spezia suffers from the lack of railway communication with the interior,—the range of the Apennines lying between it and the more productive regions of Northern Italy. The whole movement of the port in 1884 was represented by 38 vessels engaged in foreign trade (tonnage, 29,251) and 1333 engaged in the coasting trade (tonnage, 198,447). Though the town itself, with the barracks and military hospital as its principal buildings, presents little to attract the foreign visitor, the beauty of the gulf and of the neighbouring country has brought Spezia into some repute as a watering-place, and there are several excellent hotels in the Corso. The walls and gates of the old city are for the most part destroyed. In one of the public squares is a statue of Admiral Chiodo, the founder of the arsenal. The population of the city was 6105 in 1861 (commune 11,556) and 19,864 in 1881 (commune 30,732).

The origin of Spezia is doubtful; but it probably rose after the destruction of Luna. Sold by one of the Fieschi in 1276 to Genoa, the town was fortified by its new possessors and made the seat of a governor of some importance. It became a city in the 16th century. The idea of making the Gulf of Spezia a great naval centre was first broached by Napoleon I.

SPHEROMETER, an instrument for the precise measurement of the radius of a sphere or the thickness of a thin plate. The usual form consists of a fine screw moving in a nut carried on the centre of a small three-legged table. The lower end of the screw and those of the table legs are finely tapered and terminate in hemispheres, so that each rests on a point. If the screw has two turns of the thread to the millimètre, the head is usually divided into 500 equal parts, so that differences of 0.001 millimètre may be measured without using a vernier. A vertical scale fastened to the table indicates the number of whole turns of the screw and serves as a fixed point for reading the divisions on the head. In order to measure the thickness of a plate the instrument is placed on a level plane surface and the screw turned until the point just touches; the exact instant when it does so is defined by a sudden diminution of resistance succeeded by a considerable increase. The divided head and scale are read; the screw is raised; the thin plate slipped under it; and the process is repeated. The difference between the two readings gives

the required thickness A contact-lever, delicate level, or electric contact arrangement may be attached to the spherometer in order to indicate the moment of touching more precisely than is possible by the sense of touch To measure the radius of a sphere—*e g*, the curvature of a lens—the spherometer is levelled and read, then placed on the sphere, adjusted until the four points exert equal pressure, and read again The difference gives the thickness of that portion of the sphere cut off by a plane passing through the three feet, and, since the feet are equidistant, this distance (a) being known gives the value (R) of the radius from the formula $2R = \frac{a^2}{3h} + h$, where h is the thickness of the lenticular segment The *well spherometer*[1] is adapted for measuring small spherical lenses The true plane on which the instrument stands is perforated by a cylindrical well of known diameter A plate applied to the lower edge of the well by a spring is adjusted to be parallel to the large plane, and the spherometer screw, being centred over the well, is run down until it touches the plate, and then read The plate is removed, the lens put in its place, the point—still accurately centred—is brought down, and the screw is read again The difference between these readings gives the height of the section of the lens above the lower edge of the well Calling this height h and the radius of the cylindrical well r, the radius R of the sphere is got by the formula $2R = \frac{r^2}{h} + h$ The spherometer can be applied to test the sphericity of a globe, and may be used on either a convex or a concave surface

SPHINX, a hybrid creature of Egyptian and Greek art and mythology In Egypt the sphinxes are colossal images of granite or porphyry, with a human head and breast and the body of a lion (wingless) lying down The largest and most famous is that of Gizeh, described in vol vii p 772 The head of the sphinx is usually that of a man, but female heads are said to occur occasionally From Egypt the figure of the sphinx passed to Assyria, where it appears with a bearded male head on cylinders, the female sphinx, lying down and furnished with wings, is first found in the palace of Esarhaddon (7th century B C) Sphinxes have been found in Phœnicia, one at least being winged and another bearded In Asia Minor an ancient female sphinx, but wingless, stands on the sacred road near Miletus Sphinxes of the usual Greek type (female heads with bodies of winged lions) are represented seated on each side of two doorways in an ancient frieze found by Sir Charles Fellowes at Xanthus in Lycia, and now in the British Museum The same type appears on the early sculptures of the temple at Assus In the early art of Cyprus—that half-way house between Asia and Greece—sphinxes of this type are not uncommon On the other hand, on a gem of Phœnician style found at Curium in Cyprus there appear two male (bearded) sphinxes, with the tree of life between them With regard to Greece proper, in the third tomb on the acropolis of Mycenæ were found six small golden sphinxes, they are beardless, but the sex is doubtful In the ancient tomb discovered in 1877 at Spata near Athens (which represents a kindred but somewhat later art than the tombs at Mycenæ) were found female winged sphinxes carved in ivory or bone Sphinxes on glass plates have been found in graves at Camirus in Rhodes and on gold plates in Crimean graves Sphinxes were represented on the throne of Apollo at Amyclæ, in the best period of Greek art a sphinx was sculptured on the helmet of the statue of Athene in the Parthenon at Athens, and sphinxes carrying off children were sculptured on the front feet of the throne of Zeus at Olympia.

[1] A M Meyer, in *American Journal of Science*, 1886, xxxii p 61

In Greek mythology the most famous sphinx was that of Thebes in Bœotia She is first mentioned by Hesiod (*Theog*, 326), who calls her the daughter of Orthus and Chimæra According to Apollonius (iii 5, 8), she was the daughter of Typhon and Echidna, and had the face of a woman, the feet and tail of a lion, and the wings of a bird She dwelt on a bald rocky mountain at the south-east corner of the Copaic lake, the name of the mountain was Phicium (now Fagas), which was derived from Phix, the Æolic form of sphinx The Muses taught her a riddle and the Thebans had to guess it Whenever they failed she carried one of them off and devoured him The riddle was this What is that which is four-footed, three-footed, and two-footed? At last Œdipus guessed correctly that it was man, for the child crawls on hands and feet, the adult walks upright, and the old man supports his steps with a stick Then the sphinx threw herself down from the mountain

The story of the sphinx's riddle first occurs in the Greek tragedians Milchhofer believes that the story was a mere invention of Greek fancy, an attempt to interpret the mysterious figure which Greek art had borrowed from the East On the other hand, he holds that the destroying nature of the sphinx was much older, and he refers to instances in both Egyptian and Greek art where a sphinx is seen seizing and standing upon a man And, whereas the Theban legend is but sparingly illustrated in Greek art, the figure of the sphinx appears more commonly on tombs, sculptured either in the round or in relief From this Milchhofer seems to infer that the sphinx was a symbol of death The word "sphinx" is Greek, being derived from σφίγγειν, "to draw tight"

SPIKENARD, or NARD (Hebrew *nērd*, Gr νάρδος, from Sanskrit *naladutha*, the change from "r" to "l" seeming to indicate that the word came through Persia),[2] a celebrated perfume which seems to have formed one of the most durable aromatic ingredients in the costly unguents used by the Romans and Eastern nations The ointment prepared from it ("ointment of pistic nard"[3]) is mentioned in the New Testament (Mark xiv 3-5, John xii 3-5) as being "very costly," a pound of it being valued at more than 300 denarii (over £10) This appears to represent the prices then current for the best quality of nard, since Pliny (*H N*, xii 26) mentions that nard spikes reached as much as 100 denarii per lb, and, although he does not mention the price of nard ointment, he states (xiii 2) that the "unguentum cinnamominum," a similar preparation, ranged from 25 to 300 denarii according to its quality Nard ointment also varied considerably in price from its liability to sophistication (Id, xii 26, 27, xiii 2) The ingredients of the genuine ointment (*unguentum nardinum sive foliatum*), Pliny tells us (xiii 2), were Indian nard, juncus (the leaves of *Andropogon Schœnanthus*, L), costus (the root of *Aplotaxis auriculata*, DC), amomum (the fruits of *Amomum Cardamomum*, L), myrrh (the gum-resin of *Balsamodendron Myrrha*, Nees), balm (the oleo-resin of *Balsamodendron Opobalsamum*), omphacium or oleum omphacinum (the oil expressed from unripe olives), and balaninum (derived from *Balanites ægyptiaca*?) Dioscorides (i 75) also remarks that malabathrum (the leaf of *Cinnamomum Tamala*, Nees) was sometimes added Of these ingredients costus and amomum were most relied upon for increasing the fragrance and the nard for the stimulating and other virtues of the unguent[4]

[2] See Fick, in *Orient u Occident*, iii p 364 The Syrians and Arabs simply call it "spike" (*shebāltā*, *sunbul*) or "the Indian spike"

[3] The meaning of the word "pistic" is uncertain, some rendering it "genuine," others "liquid," and others taking it for a local name

[4] The use of alabaster vessels for preserving these fragrant unguents

The exact botanical source of the true or Indian nard was long a matter of uncertainty, the descriptions given by ancient authors being somewhat vague Theophrastus (*De Odor*, 28) classes nard amongst roots, and states that it came from India (*Hist Plant*, ix 7, 2), had a biting and hot taste, and resembled iris root in perfuming the air near it (*De Odor*, 12, 56) He also remarks (*l c*, 42) that the ointment was one of the most durable of perfumes Pliny (*H N*, xii 26, 27) gives a somewhat confused account, from which it appears that both "spike" and leaf were in use, although it is not clear whether the spike (*spica*) consisted of the flower-head or the fibrous lower portion of the stem The only definite statement he makes concerning it is that the "sincere" nard is known by its red colour, sweet smell, and especially taste, "for it drieth the tongue and leaveth a pleasant relish behind it" Dioscorides (i 6) states that the true nard came from India and was collected on mountains beside which the river Ganges flowed He describes it as blackish with short spikes, smelling something like cyperus Linnæus, Blane, Hatchett, and other writers have supposed that spikenard was an Indian grass of the genus *Andropogon* (*A Nardus*, L), but Sir W Jones (*As Res*, ii 416, iv 97) has given convincing reasons for identifying it with *Nardostachys Jatamansi*,[1] a plant of the Valerian order, the fibrous rootstocks or "spikes" of which are still collected in the mountains of Bhotan and Nepal Further evidence is afforded by Lambert (*Illustr of the Genus Cinchona*, App, p 177), who found the root under the name of "spikenard" in one of the oldest chemist's shops in London, also by Dymock (*Mat Med W India*, 2d ed, p 347), who states that the principal use of the drug at the present time is for making hair washes and ointments, the popular opinion being that it promotes the growth and blackness of the hair The name of "spike" applied to the Indian nard appears to be derived from its resemblance in shape to a spike or ear of bearded corn The root is crowned by the bases of several stems, each about 2 inches or more in length and as thick as the finger To these the fibrous tissue of former leaves adheres and gives them a peculiar bristly appearance It is this portion that is chiefly collected

Other and inferior varieties of nard are mentioned by Dioscorides and subsequent writers Celtic nard, obtained from the Ligurian Alps and Istria, consisted of the roots of plants also belonging to the Valerian order (*Valeriana celtica* and *V saliunca*) This was exported to the East and thence to Egypt, and was used in the preparation of baths Mountain nard was collected in Cilicia and Syria, and is supposed to have consisted of the root of *Valeriana tuberosa* The false nard of Dauphine, used in later times, and still employed as a charm in Switzerland, is the root stock of *Allium Victorialis* It presents a singular resemblance to the spikes of Indian nard, but is devoid of fragrance It is remarkable that all the nards belong to the natural order *Valerianaceæ*, the odour of valerian being considered disagreeable at the present day, that of *Nardostachys Jatamansi* is intermediate between valerian and patchouli, although more agreeable than either

The name "spikenard" has also been applied in later times to several plants The spikenard of the United States is *Aralia racemosa*, and another species of the same genus, *A nudicaulis*, is known as "false spikenard" In the West Indies *Hyptis suaveolens* is called "spikenard," and in Great Britain the name "ploughman's spikenard" is given to *Inula Conyza* (E M H)

SPINEL See MINERALOGY, vol xvi p 386, and RUBY

SPINELLO ARETINO (*c* 1330-*c* 1410), painter, the son of a Florentine named Luca, who had taken refuge in Arezzo in 1310 when exiled with the rest of the Ghibelline party, was born at Arezzo about 1330 Spinello was a pupil of Jacopo di Casentino, a follower of Giotto, and his own style was a sort of link between the school of Giotto and that of Siena In the early part of his life he worked in Florence as an assistant to his master Jacopo while painting frescos in the church of the Carmine and in Sta Maria Novella Between 1360 and 1384 he was occupied in painting many frescos in and near Arezzo, almost all of which have now perished[2] After the sack of Arezzo in 1384 Spinello returned to Florence, and in 1387-88 with some assistants covered the walls and vault of the sacristy of S Miniato near Florence with a series of frescos, the chief of which represent scenes from the life of St Benedict These still exist, though in a sadly restored condition, they are very Giotto-like in composition, but have some of the Siena decorative brilliance of colour In 1391-92 Spinello was painting six frescos, which still remain on the south wall of the Pisan Campo Santo, representing miracles of St Potitus and St Ephesus For these he received 270 gold florins Among his later works the chief are the very fine series of frescos painted in 1407-8 on the walls and vault of a chapel in the municipal buildings of Siena, these also have suffered much from repainting, but still are the finest of Spinello's existing frescos Sixteen of these represent the war of Frederick Barbarossa against the republic of Venice Spinello died at Arezzo about 1410

Spinello's frescos are all strong and highly decorative works, drawn with much spirit, and are very superior in style to his panel pictures, many of which appear to be mere *bottega* productions The academy of Florence possesses a panel of the Madonna and Saints, which is chiefly interesting for its signature—"Hoc opus pinxit Spinellus Luce Aritio D I A 1391" The easel pictures which are to be found in the various galleries of Europe give little or no notion of Spinello's power as a painter

SPINNING See YARN

SPINOLA, AMBROGIO SPINOLA, MARCHESE DI (*c* 1571-1630), a celebrated general, belonged to a noble and wealthy Italian family, and was born at Genoa about 1571 After the siege of Ostend had languished for more than two years under the direction of the archduke Albert, Spinola, who, though not a soldier by profession, had seen something of campaigning during a season or two, came upon the scene as a condottiere and received charge of the works He entered upon his task in October 1603, and his courage and vigour were rewarded by the surrender of the place on 20th September 1604 During the next five years, until the conclusion of the armistice of 1609, he frequently encountered Maurice of Orange, but on the whole with undecisive results In 1620 he was sent by Spain into the Palatinate of the Rhine, and took many places, in the following year, on the renewal of the war with Holland, he returned to the scenes of his earlier campaigns, where his principal exploits were the capture of Julich in February 1622 and of Breda after a ten months' siege in June 1625 His health now began to give way, and his spirits are said to have been further depressed by Philip's disregard of his pecuniary claims He died at Castel-Nuovo di Scrivia on 25th September 1630.

SPINOZA, BARUCH (1632-1677), or, as he afterwards signed himself, Benedict de Spinoza, philosopher, was born at Amsterdam on 24th November 1632 His parents be-

was customary at a very early period Theophrastus (*c* 314 B C) states that vessels of lead and alabaster were best for the purpose, on account of their density and coolness, and their power of resisting the penetration of the ointment into their substance Pliny also recommends alabaster for ointment vases For small quantities onyx vessels seem to have been used (Horace, *Carm* iv, 12, ll 10, 17)

[1] The plant figured by Sir W Jones is *Valeriana Hardwickii* (probably the inferior Gangetic nard of Dioscorides and the ozænitis of Pliny), the true plant is figured by Royle and Lambert

[2] The fine fresco of an Apocalyptic scene which still exists in S Maria degli Angeli at Arezzo belongs to about 1400

longed to the community of Jewish emigrants from Portugal and Spain who, fleeing from Catholic persecution in the Peninsula, had sought refuge in the nearly emancipated Netherlands. The name, variously written De Spinoza, D'Espinoza, and Despinoza, probably points to the province of Leon as the previous home of the family; there are no fewer than five townships so called in the neighbourhood of Burgos. Of the philosopher's parents nothing is known. His father is said to have been a tradesman in fair circumstances, and the house is still shown upon the Burgwal where his son Baruch was born; two sisters, Rebekah and Miriam, formed the remainder of the family. Spinoza received his first training under the senior rabbi, Saul Levi Morteira, whose most promising pupil he soon became. Under Morteira he became familiar with the Talmud and, what was probably more important for his own development, with the philosophical writings of Ibn Ezra and Maimonides, Levi ben Gerson, Chasdai Creskas, and other representatives of Jewish mediæval thought, who aim at combining the traditional theology with ideas got from Aristotle and his Neoplatonic commentators. Latin, still the universal language of learning, formed no part of Jewish education; and Spinoza, after learning the elements from a German master, resorted for further instruction to a physician named Franz van den Ende, who eked out an income by taking pupils. Van den Ende appears to have been distinctly a man of parts, though of a somewhat indiscreet and erratic character. He was eventually hanged in Paris as a conspirator in 1674. His enthusiasm for the natural sciences may have been the only ground for the reputation he had acquired of instilling atheistic notions into the minds of his pupils along with the Latin which he taught them. But it is quite possible that his scientific studies had bred in him, as in many others at that time, a materialistic, or at least a naturalistic, turn of mind; indeed we should expect as much in a man of Van den Ende's somewhat rebellious temperament. We do not know whether his influence was brought to bear in this sense upon Spinoza; but it has been suggested that the writings of Bruno, whose spirit of enthusiastic naturalism and fervid revolt against the church would be especially dear to a man of Van den Ende's leanings, may have been put into the pupil's hand by the master. Latin, at all events, Spinoza learned from Van den Ende to use with correctness, freedom, and force, though his language does not, of course, conform to classical canons. The only romance of Spinoza's life is connected with Van den Ende's household. The physician had an only daughter, Clara Maria by name, who, besides being a proficient in music, understood Latin, it is said, so perfectly that she was able to teach her father's pupils in his absence. Spinoza, the story goes, fell in love with his fair instructress; but a fellow-student, called Kerkering, supplanted him in his mistress's affections by the help of a valuable necklace of pearls which he presented to the young lady. Chronology unfortunately forbids us to accept this little episode as true. Recent investigation has proved that, while the marriage with Kerkering, or rather Kerckkrinck, is a fact, it did not take place till 1671, in which year the bride, as appears by the register, was twenty-seven years of age. She cannot, therefore, have been more than eleven or twelve in 1656, the year in which Spinoza left Amsterdam; and as Kerckkrinck was seven years younger than Spinoza, they cannot well have been simultaneous pupils of Van den Ende and simultaneous suitors for his daughter's hand. But, though the details of the story thus fall to pieces, it is still possible that in the five years which followed his retirement from Amsterdam Spinoza, who was living within easy distance and paid visits to the city from time to time, may have kept up his connexion with Van den Ende, and that the attachment may have dated from this later period. This would at least be some explanation for the existence of the story; for Colerus expressly says that Spinoza "often confessed that he meant to marry her." But beyond possibility we cannot go in the matter. There is no mention of the Van den Endes in Spinoza's correspondence; and in the whole tenor of his life and character there is nothing on which to fasten the probability of a romantic attachment.

The mastery of Latin which he acquired from Van den Ende opened up to Spinoza the whole world of modern philosophy and science, both represented at that time by the writings of Descartes. He read him greedily, says Colerus, and afterwards often declared that he had all his philosophical knowledge from him. The impulse towards natural science which he had received from Van den Ende would be strengthened by the reading of Descartes; he gave over divinity, we are told, to devote himself entirely to these new studies. His inward break with Jewish orthodoxy dated, no doubt, farther back,—from his acquaintance with the philosophical theologians and commentators of the Middle Ages; but these new interests combined to estrange him still further from the traditions of the synagogue. He was seldomer seen at its services,—soon not at all. The jealousy of the heads of the synagogue was easily roused. An attempt seems to have been made to draw from him his real opinions on certain prominent points of divinity. Two so-called friends endeavoured, on the plea of doubts of their own, to lead him into a theological discussion; and, some of Spinoza's expressions being repeated to the Jewish authorities, he was summoned to give an account of himself. Anxious to retain so promising an adherent, and probably desirous at the same time to avoid public scandal, the chiefs of the community offered him a yearly pension of 1000 florins if he would outwardly conform and appear now and then in the synagogue. But such deliberate hypocrisy was abhorrent to Spinoza's nature. Threats were equally unavailing, and accordingly on the 27th of July 1656 Spinoza was solemnly cut off from the commonwealth of Israel. The curses pronounced against him may be read in most of the biographies. While negotiations were still pending, he had been set upon one evening by a fanatical ruffian, who thought to expedite matters with the dagger. Warned by this that Amsterdam was hardly a safe place of residence for him any longer, Spinoza had already left the city before the sentence of excommunication was pronounced. He did not go far, but took up his abode with a friend who lived some miles out on the Old Church road. His host belonged to the Collegiants or Rhynsburgers, a religious society which had sprung up among the proscribed Arminians of Holland. The pure morality and simple-minded piety of this community seem early to have attracted Spinoza, and to have won his unfeigned respect. Several of his friends were Collegiants, or belonged to the similarly-minded community of the Mennonites, in which the Collegiants were afterwards merged. In this quiet retreat Spinoza spent nearly five years. He drew up a protest against the decree of excommunication, but otherwise it left him unmoved. From this time forward he disused his Hebrew name of Baruch, adopting instead the Latin equivalent, Benedictus. Like every Jew, Spinoza had learned a handicraft; he was a grinder of lenses for optical instruments, and was thus enabled to earn an income sufficient for his modest wants. His skill, indeed, was such that lenses of his making were much sought after, and those found in his cabinet after his death fetched a high price. It was as an optician that he was first brought into connexion with Huygens and Leibnitz; and an optical *Treatise on the Rainbow*, written by him and long supposed to be lost, has been recently

discovered and reprinted by Dr Van Vloten He was also fond of drawing as an amusement in his leisure hours, and Colerus had seen a sketch-book full of such drawings representing persons of Spinoza's acquaintance, one of them being a likeness of himself in the character of Masaniello

The five years which followed the excommunication must have been devoted to concentrated thought and study Before their conclusion Spinoza had parted company from Descartes, and the leading positions of his own system were already clearly determined in his mind A number of the younger men in Amsterdam—many of them students of medicine or medical practitioners—had also come to regard him as their intellectual leader A kind of philosophical club had been formed, including among its members Simon de Vries, John Bresser, Louis Meyer, and others who appear in Spinoza's correspondence Originally meeting in all probability for more thoroughgoing study of the Cartesian philosophy, they looked naturally to Spinoza for guidance, and by-and-by we find him communicating systematic drafts of his own views to the little band of friends and students The manuscript was read out and discussed at their meetings, and any points remaining obscure were referred to Spinoza for further explanation An interesting specimen of such difficulties, propounded by Simon de Vries and resolved by Spinoza in accordance with his own principles, is preserved for us in Spinoza's correspondence This Simon de Vries was a youth of generous impulses and of much promise Being in good circumstances, he was anxious to show his gratitude to Spinoza by a gift of 2000 florins, which the philosopher half-jestingly excused himself from accepting De Vries died young, and would fain have left his fortune to Spinoza, but the latter refused to stand in the way of his brother, the natural heir, to whom the property was accordingly left, with the condition that he should pay to Spinoza an annuity sufficient for his maintenance The heir offered to fix the amount at 500 florins, but Spinoza accepted only 300, a sum which was regularly paid till his death The written communications of his own doctrine referred to above belong to a period after Spinoza had removed from the neighbourhood of Amsterdam, but it has been conjectured that the *Short Treatise on God, on Man, and his Wellbeing*, which represents his thoughts in their earliest systematic form, was left by him as a parting legacy to this group of friends It is at least certain, from a reference in Spinoza's first letter to Oldenburg, that such a systematic exposition was in existence before September 1661 [1] There are two dialogues somewhat loosely incorporated with the work which probably belong to a still earlier period The short appendix, in which the attempt is made to present the chief points of the argument in geometrical form, is a forerunner of the *Ethics*, and was probably written somewhat later than the rest of the book The term "Nature" is put more into the foreground in the *Treatise*, a point which might be urged as evidence of Bruno's influence,—the dialogues, moreover, being specially concerned to establish the unity, infinity, and self-containedness of Nature[2], but the two opposed Cartesian attributes, thought and extension, and the absolutely infinite substance whose attributes they are—substance constituted by infinite attributes—appear here as in the *Ethics* The latter notion—of substance—is said to correspond exactly to "the essence of the only glorious and blessed God" The earlier differs from the later exposition in allowing an objective causal relation between thought and extension, for which there is substituted in the *Ethics* the idea of a thoroughgoing parallelism

Early in 1661 Spinoza's host removed to Rhijnsburg near Leyden, the headquarters of the Collegiant brotherhood, and Spinoza removed with him The house where they lived at Rhijnsburg is still standing, and the road bears the name of Spinoza Lane Very soon after his settlement in his new quarters he was sought out by Henry Oldenburg, the first secretary of the Royal Society [3] Oldenburg became Spinoza's most regular correspondent,—a third of the letters preserved to us are to or from him, and it appears from his first letter that their talk on this occasion was "on God, on infinite extension and thought, on the difference and the agreement of these attributes, on the nature of the union of the human soul with the body, as well as concerning the principles of the Cartesian and Baconian philosophies" Spinoza must therefore have unbosomed himself pretty freely to his visitor on the main points of his system Oldenburg, however, was a man of no speculative capacity, and, to judge from his subsequent correspondence, must have quite failed to grasp the real import and scope of the thoughts communicated to him From one of Oldenburg's early letters we learn that the treatise *De Intellectus Emendatione* was probably Spinoza's first occupation at Rhijnsburg The nature of the work also bears out the supposition that it was first undertaken It is, in a manner, Spinoza's "organon,"—the doctrine of method which he would substitute for the corresponding doctrines of Bacon and Descartes, as alone consonant with the thoughts which were shaping themselves or had shaped themselves in his mind It is a theory of philosophical truth and error, involving an account of the course of philosophical inquiry and of the supreme object of knowledge It was apparently intended by the author as an analytical introduction to the constructive exposition of his system, which he presently essayed in the *Ethics* But he must have found as he proceeded that the two treatises would cover to a large extent the same ground, the account of the true method merging almost inevitably in a state-

[1] Various manuscript copies were apparently made of the treatise in question, but it was not printed, and dropped entirely out of knowledge till 1852, when Edward Bohmer of Halle lighted upon an abstract of it attached to a copy of Colerus's *Life*, and shortly afterwards upon a Dutch MS purporting to be a translation of the treatise from the Latin original This was published in 1862 by Van Vloten with a re-translation into Latin Since then a superior Dutch translation has been discovered, which has been edited by Professor Schaarschmidt and translated into German Another German version with introduction and notes has been published by Sigwart based on a comparison of the two Dutch MSS

[2] The fact that Spinoza nowhere mentions Bruno would not imply, according to the literary habits of those days, that he was not acquainted with his speculations and even indebted to them There is no mention, for example, of Hobbes throughout Spinoza's political writing, and only one casual reference to him in a letter, although the obligation of the Dutch to the English thinker lies on the surface Accordingly full weight must be allowed to the internal evidence brought forward by Sigwart and others to prove Spinoza's acquaintance with Bruno's writings But in regard to this question, and in regard to the elaborate researches directed to prove that the main determinations of Spinoza's thought are anticipated in the mediæval philosophers of his own race, it must be said that these investigations are of comparatively little vital interest Doubtless Spinoza's thought was coloured by his Hebraic origin and his Hebraic studies, from these sources, above all, he may have brought with him to the study of the dualistically expressed philosophy of Descartes the need, and the profound conviction, of unity But the main strain of Spinoza's thought is sufficiently explained by reference to the Cartesian philosophy itself, the intellectual *milieu* of the time Descartes's metaphysics can be shown to lead us to the very threshold of Spinoza's system, not only the general form, but the very terminology—substance, attributes, and modes—lay waiting to be appropriated by an independent student

[3] Henry Oldenburg (*c* 1626-1678) was a native of Bremen, but had settled in England in the time of the Commonwealth Though hardly a scientific man himself, he had a genuine interest in science, and must have possessed social gifts He was the friend of Boyle, and acquainted with most of the leaders of science in England as well as with many on the Continent He delighted to keep himself in this way *au courant* with the latest developments, and lost no opportunity of establishing relations with men of scientific reputation It was probably at the suggestion of Huygens that he bent his steps towards Spinoza's lodging

ment of the truth reached by its means. The *Amendment of the Understanding* was therefore put aside unfinished, and was first published in the *Opera Posthuma*. Spinoza meanwhile concentrated his attention upon the *Ethics*, and we learn from the correspondence with his Amsterdam friends that a considerable part of book i. had been communicated to the philosophical club there before February 1663. It formed his main occupation for two or three years after this date. Though thus giving his friends freely of his best, Spinoza did not cast his thoughts broadcast upon any soil. He had a pupil living with him at Rhijnsburg whose character seemed to him lacking in solidity and discretion. This pupil (probably Albert Burgh, who afterwards joined the Church of Rome and penned a foolishly insolent epistle to his former teacher) was the occasion of Spinoza's first publication,—the only publication indeed to which his name was attached. Not deeming it prudent to initiate the young man into his own system, he took for a text-book the second and third parts of Descartes's *Principles*, which deal in the main with natural philosophy. As he proceeded he put Descartes's matter in his own language and cast the whole argument into a geometric form. At the request of his friends he devoted a fortnight to applying the same method to the first or metaphysical part of Descartes's philosophy, and the sketch was published in 1663, with an appendix entitled *Cogitata Metaphysica*, still written from a Cartesian standpoint (defending, for example, the freedom of the will), but containing hints of his own doctrine. The book was revised by Dr Meyer for publication and furnished by him, at Spinoza's request, with a preface, in which it is expressly stated that the author speaks throughout not in his own person but simply as the exponent of Descartes. A Dutch translation appeared in the following year.[1]

In 1663 Spinoza removed from Rhijnsburg to Voorburg, a suburban village about 2 miles from The Hague. His reputation had continued to spread. From Rhijnsburg he had paid frequent visits to The Hague, and it was probably the desire to be within reach of some of the friends he had made in these visits—among others the De Witts—that prompted his change of residence. He had works in hand, moreover, which he wished in due time to publish; and in that connexion the friendly patronage of the De Witts might be of essential service to him. The first years at Voorburg continued to be occupied by the composition of the *Ethics*, which was probably finished, however, by the summer of 1665. A journey made to Amsterdam in that year is conjectured to have had reference to its publication. But, finding that it would be impossible to keep the authorship secret, owing to the numerous hands through which parts of the book had already passed, Spinoza determined to keep his manuscript in his desk for the present. In September 1665 we find Oldenburg twitting him with having turned from philosophy to theology and busying himself with angels, prophecy, and miracles. This is the first reference to the *Tractatus Theologico-Politicus*, which formed his chief occupation for the next four years. The aim of this treatise may be best understood from the full title with which it was furnished—*Tractatus Theologico-Politicus, continens dissertationes aliquot, quibus ostenditur libertatem philosophandi non tantum salva pietate et reipublicæ pace posse concedi sed eandem nisi cum pace reipublicæ ipsaque pietate tolli non posse*. It is, in fact, an eloquently reasoned defence of liberty of thought and speech in speculative matters. The external side of religion—its rites and observances—must of necessity be subject to a certain control on the part of the state, whose business it is to see to the preservation of decency and order. But, with such obvious exceptions, Spinoza claims complete freedom of expression for thought and belief; and he claims it in the interests alike of true piety and of the state itself. The thesis is less interesting to a modern reader—because now generally acknowledged—than the argument by which it is supported. Spinoza's position is based upon the thoroughgoing distinction drawn in the book between philosophy, which has to do with knowledge and opinion, and theology, or, as we should now say, religion, which has to do exclusively with obedience and conduct. The ægis of religion, therefore, cannot be employed to cover with its authority any speculative doctrine; nor, on the other hand, can any speculative or scientific investigation be regarded as putting religion in jeopardy. Spinoza undertakes to prove his case by the instance of the Hebrew Scriptures. Scripture deals, he maintains, in none but the simplest precepts, nor does it aim at anything beyond the obedient mind; it tells us nought of the divine nature, but what men may profitably apply to their lives. The greater part of the treatise is devoted to working out this line of thought; and in so doing Spinoza consistently applies to the interpretation of the Old Testament those canons of historical exegesis which are often regarded as of comparatively recent growth. The treatise thus constitutes the first document in the modern science of Biblical criticism. It was published in 1670, anonymously, printer and place of publication being likewise disguised (*Hamburgi apud Henricum Kunraht*). The storm of opposition which it encountered showed that these precautions were not out of place. It was synodically condemned along with Hobbes's *Leviathan* and other books as early as April 1671, and was consequently interdicted by the states-general of Holland in 1674; before long it was also placed on the Index by the Catholic authorities. But that it was widely read appears from its frequent re-issue with false title-pages, representing it now as an historical work and again as a medical treatise. Controversialists also crowded into the lists against it. A translation into Dutch appears to have been proposed; but Spinoza, who foresaw that such a step would only increase the commotion which was so distasteful to him, steadily set his face against it. No Dutch translation appeared till 1693.

The same year in which the *Treatise* was published Spinoza removed from his suburban lodging at Voorburg into The Hague itself. He took rooms first on the Veerkay with the widow Van de Velde, who in her youth had assisted Grotius to escape from his captivity at Loewenstein. This was the house afterwards occupied by Colerus, the worthy Lutheran minister who became Spinoza's biographer. But the widow insisted on boarding her lodger, and Spinoza presently found the expense too great for his slender purse. He accordingly removed to a house on the Pavelioen Gracht near at hand, occupied by a painter called Van der Spijck. Here he spent the remaining years of his life in the frugal independence which he prized. Colerus gives particulars which enable us to realize the almost incredible simplicity and economy of his mode of life. He would say sometimes to the people of the house that he was like the serpent who forms a circle with his tail in his mouth, meaning thereby that he had nothing left at the year's end. His friends came to visit him in his lodgings, as well as others attracted by his reputation—Leibnitz among the rest—and were courteously entertained, but Spinoza preferred not to accept their offers of hospitality. He spent the greater part of his time quietly in his own chamber, often having his meals brought there and sometimes not leaving it for two or three days together when absorbed in his studies. On one occasion he did not leave the house for three

[1] The title of the Latin original ran—*Renati des Cartes Principiorum Philosophiæ pars i. et ii. more geometrico demonstratæ per Benedictum de Spinoza Amstelodamensem. Accesserunt ejusdem Cogitata Metaphysica.*

months. "When he happened to be tired by having applied himself too much to his philosophical meditations, he would go downstairs to refresh himself, and discoursed with the Van der Spijcks about anything that might afford matter for an ordinary conversation, and even about trifles. He also took pleasure in smoking a pipe of tobacco; or, when he had a mind to divert himself somewhat longer, he looked for some spiders and made them fight together, or he threw some flies into the cobweb, and was so well pleased with the result of that battle that he would sometimes break into laughter" (Colerus). He also conversed at times on more serious topics with the simple people with whom he lodged, often, for example, talking over the sermon with them when they came from church. He occasionally went himself to hear the Lutheran pastor preach—the predecessor of Colerus—and would advise the Van der Spijcks not to miss any sermon of so excellent a preacher. The children, too, he put in mind of going often to church, and taught them to be obedient and dutiful to their parents. One day his landlady, who may have heard strange stories of her solitary lodger, came to him in some trouble to ask him whether he believed she could be saved in the religion she professed. "Your religion is a good one," said Spinoza; "you need not look for another, nor doubt that you will be saved in it, provided that, while you apply yourself to piety, you live at the same time a peaceable and quiet life." Only once, it is recorded, did Spinoza's admirable self-control give way, and that was when he received the news of the murder of the De Witts by a frantic mob in the streets of The Hague. It was in the year 1672, when the sudden invasion of the Low Countries by Louis XIV raised an irresistible clamour for a military leader and overthrew the republican constitution for which the De Witts had struggled. John De Witt had been Spinoza's friend, and had bestowed a small pension upon him; he had Spinoza's full sympathy in his political aims. On receiving the news of the brutal murder of the two brothers, Spinoza burst into tears, and his indignation was so roused that he was bent upon publicly denouncing the crime upon the spot where it had been committed. But the timely caution of his host prevented his issuing forth to almost certain death. Not long after Spinoza was himself in danger from the mob, in consequence of a visit which he paid to the French camp. He had been in correspondence with one Colonel Stoupe, a Swiss theologian and soldier, then serving with the prince of Condé, the commander of the French army at Utrecht. From him Spinoza received a communication enclosing a passport from the French commander, who wished to make his acquaintance and promised him a pension from the French king at the easy price of a dedication to his majesty. Spinoza went to Utrecht, but returned without seeing Condé, who had in the meantime been called elsewhere; the pension he civilly declined. There may have been nothing more in the visit than is contained in this narrative; but on his return Spinoza found that the populace of The Hague regarded him as no better than a spy. The town was full of angry murmurs, and the landlord feared that the mob would storm his house and drag Spinoza out. Spinoza quieted his fears as well as he could, assuring him that as soon as the crowd made any threatening movement he would go out to meet them, "though they should serve me as they did the poor De Witts. I am a good republican and have never had any aim but the honour and welfare of the state." Happily the danger passed off without calling for such an ordeal.

In 1673 Spinoza received an invitation from the elector palatine to quit his retirement and become professor of philosophy in the university of Heidelberg. The offer was couched in flattering terms, and conveyed an express assurance of "the largest freedom of speech in philosophy, which the prince is confident that you will not misuse to disturb the established religion." But Spinoza's experience of theological sensitiveness led him to doubt the possibility of keeping on friendly terms with the established religion, if he were placed in a public capacity. Moreover, he was not strong; he had had no experience of public teaching; and he foresaw that the duties of a chair would put an end to private research. For all these reasons he courteously declined the offer made to him. There is little more to tell of his life of solitary meditation. In 1675 we learn from his correspondence that he entertained the idea of publishing the *Ethics*, and made a journey to Amsterdam to arrange matters with the printer. "But, whilst I was busy with this," he writes, "the report was spread everywhere that a certain book of mine was in the press, wherein I endeavoured to show that there was no God; and this report found credence with many. Whereupon certain theologians (themselves perhaps the authors of it) took occasion to complain of me to the prince and the magistrates; moreover, the stupid Cartesians, because they are commonly supposed to side with me, desiring to free themselves from that suspicion, were diligent without ceasing in their execrations of my doctrines and writings, and are as diligent still." As the commotion seemed to grow worse instead of subsiding, Spinoza consigned the manuscript once more to his desk, from which it was not to issue till after his death. His last literary work was the unfinished *Tractatus Politicus* and the preparation of notes for a new edition of the *Tractatus Theologico-Politicus*, in which he hoped to remove some of the misunderstandings which the book had met with. The *Tractatus Politicus* develops his philosophy of law and government on the lines indicated in his other works, and connects itself closely with the theory enunciated by Hobbes a generation before. Consumption had been making its insidious inroads upon Spinoza for many years, and early in 1677 he must have been conscious that he was seriously ill. On Saturday the 20th of February he sent to Amsterdam for his friend Dr Meyer. On the following day the Van der Spijcks, having no thought of immediate danger, went to the afternoon service. When they came back Spinoza was no more; he had died about three in the afternoon with Meyer for the only witness of his last moments. Spinoza was buried on the 25th of February "in the new church upon the Spuy, being attended," Colerus tells us, "by many illustrious persons and followed by six coaches." He was little more than forty-four years of age.

Spinoza's effects were few and realized little more than was required for the payment of charges and outstanding debts. "One need only cast one's eyes upon the account," says his biographer, "to perceive that it was the inventory of a true philosopher. It contains only some small books, some engravings, a few lenses, and the instruments to polish them." His desk, containing his letters and his unpublished works, Spinoza had previously charged his landlord to convey to Jan Rieuwertz, a publisher in Amsterdam. This was done, and the *Opera Posthuma* appeared in the same year, without the author's name, but with his initials upon the title-page. They were furnished with a preface written in Dutch by Jarig Jellis, a Mennonite friend of Spinoza's, and translated into Latin by Dr Meyer. Next year the book was proscribed in a violently worded edict by the states of Holland and West Friesland. The obloquy which thus gathered round Spinoza in the later years of his life remained settled upon his memory for a full hundred years after his death. Hume's casual allusion to "this famous atheist" and his "hideous hypothesis" is a fair specimen of the tone in which he is usually referred to; people talked about Spinoza, Lessing said, "as if he were a dead dog." The change of opinion in this respect may be dated from Lessing's famous conversation with Jacobi in 1780. Lessing, Goethe, Herder, Novalis, and Schleiermacher, not to mention philosophers like Schelling and Hegel, united in recognizing the unique strength and sincerity of Spinoza's thought, and in setting him in his rightful place among the speculative leaders of mankind. Transfused into their writings, his spirit has had a large share in moulding the philosophic thought

of the 19th century, and it has also been widely influential beyond the schools Instead of his atheism Hegel speaks of his acosmism, and Novalis dubs him a God-intoxicated man Schleiermacher's fine apostrophe is well known, in which he calls upon us to "offer a lock of hair to the manes of the holy and excommunicated Spinoza"

Spinoza's personal appearance is described by Colerus from the accounts given him by many people at The Hague who knew him familiarly "He was of a middle size, and had good features in his face, the skin somewhat dark, black curled hair, and the long eyebrows of the same colour, so that one might easily know from his looks that he was descended from the Portuguese Jews" Leibnitz also gives a similar description "The celebrated Jew Spinoza had an olive complexion and something Spanish in his face" These characteristics are preserved in a portrait in oil in the Wolfenbuttel library, which was probably the original of the (in that case unsuccessfully rendered) engraving prefixed to the *Opera Posthuma* of 1677 This portrait has recently been photographed for Dr Martineau's *Study of Spinoza* In 1880 a statue was erected to Spinoza at The Hague by international subscription among his admirers

Spinoza's philosophy is a thoroughgoing pantheism, which has both a naturalistic and a mystical side The foundation of the system is the doctrine of one infinite substance, of which all finite existences are modes or limitations (modes of thought or modes of extension) God is thus the immanent cause of the universe, but of creation or will there can be no question in Spinoza's system God is used throughout as equivalent to nature (*Deus sive natura*) The philosophical standpoint comprehends the necessity of all that is—a necessity that is none other than the necessity of the divine nature itself To view things thus is to view them, according to Spinoza's favourite phrase, *sub specie æternitatis* Spinoza's philosophy is fully considered in the article CARTESIANISM (see vol v p 152 *sq*)

Literature—The contents of the *Opera Posthuma* included the *Ethics*, the *Tractatus Politicus*, and the *De Intellectus Emendatione* (the last two unfinished), a selection from Spinoza's correspondence, and a *Compendium of Hebrew Grammar* The *Treatise on the Rainbow*, supposed to be lost, was published anonymously in Dutch in 1687. The first collected edition of Spinoza's works was made by Paulus in 1802, there is another by Gfrörer (1830), and a third by Bruder (1843-46) in three volumes Van Vloten's volume, published in 1862, *Ad Benedicti de Spinoza opera quæ supersunt omnia supplementum*, is uniform with Bruder's edition so as to complete it by a supplementary volume It contained the early treatise *De Deo et homine*, the *Treatise on the Rainbow*, and several fresh letters A complete and authoritative edition has only recently been achieved by Dr Van Vloten and Professor J P N Land The work was undertaken by them for the Spinoza Memorial Committee formed in Holland to celebrate the bicentenary of the philosopher's death, the funds remaining after the erection of the statue mentioned above were devoted to the publication of this handsome edition (2 vols, 1882-83) An English translation of *The Chief Works of Spinoza*, by R H M Elwes, appeared in 1883, and a separate translation of the *Ethics* by W H White was published in the same year, previous translations were unscholarly in execution The main authority for Spinoza's life is the sketch published in 1705, in Dutch, with a controversial sermon against Spinozism, by Johannes Colerus The French version of this *Life* (1706) has been several times reprinted as well as translated into English and German The English version, also dating from 1706, has been reprinted by Mr Frederick Pollock at the end of his work, *Spinoza, his Life and Philosophy* (1880) Mr Pollock's book and Dr Martineau's *Study of Spinoza* (1882), both admirable pieces of work, are in a manner complementary, and may with advantage be studied together In his introduction Mr Pollock gives a list of the biographical sources, and also some account of the early literature relating to Spinoza The Spinoza literature in more recent times has become so extensive as to forbid quotation A van der Linde's *Benedictus Spinoza Bibliografie* (The Hague, 1871) is a classified catalogue as nearly as possible complete down to that date (A SE)

SPIRES (Germ *Speyer* or *Speier*), the chief town of the Rhenish palatinate, Bavaria, and formerly a free imperial city, is situated on the left bank of the Rhine, at the mouth of the Speyerbach, 21 miles to the south of Worms The principal streets are broad but irregular, and the general appearance of the town little corresponds to its high antiquity, owing to the fact that it was burned by the French in 1689 The only important ancient building that has survived the flames is the cathedral, a very large and imposing basilica of red sandstone, and one of the noblest examples of Romanesque architecture now extant Beyond the general interest attaching to it as one of the old Romanesque churches of the Rhineland, Spires cathedral has a peculiar importance in the history of architecture as probably the earliest Romanesque basilica in which the nave as well as the side arcades was vaulted from the first Built in 1030-61 by Conrad II and his successor, this church has had a chequered history, its disasters culminating in 1689, when the soldiers of Louis XIV burned it to the bare walls and scattered the ashes of the eight German emperors who had been interred in the kings' choir Restored in 1772-84 and provided with a vestibule and façade, it was again desecrated by the French in 1794, but in 1846-53 it was once more thoroughly restored and adorned in the interior with gorgeous frescos at the expense of the king of Bavaria The large cathedral bowl (Domnapf) in front of the west façade formerly marked the boundary between the episcopal and municipal territories Each new bishop on his election had to fill the bowl with wine, while the burghers emptied it to his health The heathen tower to the east of the church, on foundations supposed to be Roman, was probably part of the town wall built in 1080 by Bishop Rudger Of the Retscher, or imperial palace, so called because built after the model of the Hradschin at Prague, only a mouldering fragment of wall remains It was in this palace that the famous diet of Spires met in 1529, at which the Reformers first received the name of Protestants The Altpörtel (alta porta), a fine old gateway of 1246, is a relic of the free imperial city Among the modern buildings are several churches and schools, a museum and picture gallery, &c Spires, although rebuilt in 1697, has never recovered from the cruel injuries inflicted by the French in 1689 Its trade is insignificant, although it still has a free harbour on the Rhine Its manufactures include paper, tobacco and cigars, sugar, sugar of lead, vinegar, beer, and leather Vines and tobacco are grown in the neighbourhood The population in 1880 was 15,589 and in 1885 16,228

Spires, known to the Romans as *Augusta Nemetum* or *Nemetæ*, and to the Gauls as *Noviomagus*, is one of the oldest towns on the Rhine The modern name appears first, under the form Spira, about the 7th century Captured by Julius Cæsar in 47 B C, it was repeatedly destroyed by the barbarian hordes in the first few centuries of the Christian era The town had become an episcopal seat in the 4th century, but heathenism supervened, and the present bishopric dates from 610 In 830 Spira became part of the Frankish empire, the emperors having a "palatium" here, and it was especially favoured by the Salic imperial house The contentions between the bishops and the citizens were as obstinate and severe as in any other city of Germany The situation of the town opposite the mouths of several roads through the Rhine valley early fostered its trade, in 1294 it rose to be a free imperial city, although it owned no territory beyond its walls and had a population of less than 30,000 It enjoyed great renown as the seat of the imperial supreme court from 1527 till 1689, it was fifth among the free cities of the Rhine, and had a vote in the Upper Rhenish diet Numerous imperial diets assembled here From 1801 till 1814 it was the capital of a department of France, but it was restored to Bavaria in the latter year By the peace of Spires in 1544 the Hapsburgs renounced their claims to the crown of Sardinia

SPIRITUALISM The term "spiritualism" is used by philosophical writers to denote the opposite of materialism It is also used in a narrower sense to describe the belief that the spiritual world manifests itself by producing in the physical world effects inexplicable by the known laws of nature The belief in such occasional manifestations has probably existed as long as the belief in the existence of spirits apart from human bodies, and a complete examination into it would involve a discussion of the religions of all ages and nations In 1848, however, a peculiar form of it, believed to be based on abundant experimental evidence, arose in America and spread there with great rapidity and thence over the civilized world To this movement, which has been called "modern spiritualism," the discussion in the present article is confined The movement began in a single family In 1848 a Mr and

Mrs Fox and their two daughters, living at Hydeville (Wayne), New York, were much disturbed by unexplained knockings. At length Kate Fox discovered that the cause of the sounds was intelligent and would make raps as requested, and, communication being established, the rapper professed to be the spirit of a murdered pedlar. An investigation into the matter seemed to show that none of the Fox family were concerned in producing the rappings, but the evidence that they were not concerned is insufficient, although similar noises had been noticed occasionally in the house before they lived there. It was, however, at Rochester, where the two Fox girls soon afterwards went to live with a married sister (Mrs Fish) that modern spiritualism assumed its present form, and that communication was, as it was believed, established with lost relatives and deceased eminent men. The presence of certain "mediums" was required to form the link between the worlds of the living and of the dead, and Kate Fox and her sister were the first mediums. Spiritualists do not as yet claim to know what special qualities in mediums enable spirits thus to make use of them. The earliest communications were carried on by means of "raps," or, as Mr Crookes calls them, "percussive sounds." It was agreed that one rap should mean "no" and three "yes," while more complicated messages were—and are—obtained in other ways, such as calling over or pointing to letters of the alphabet, when raps occur at the required letters.

The idea of communicating with the departed was naturally attractive even to the merely curious, still more to those who were mourning for lost friends, and most of all to those who believed that this was the commencement of a new revelation. The first two causes have attracted many inquirers; but it is the last that chiefly gives to modern spiritualism its religious aspect. Many came to witness the new wonder, and the excitement and interest spread rapidly. "Spirit-circles" were formed in several families, and other mediums discovered, exhibiting phenomena of various kinds (see below). The interest in mesmerism and the phenomena of hypnotic trance, which was widely diffused at this time both in America and Europe (see MAGNETISM, ANIMAL, vol. xv. p. 277 *sq.*), was favourable to the new idea. Information about other worlds and from higher intelligences was thought to be obtained from persons who could be put into the sleep-waking state, of whom Andrew Jackson Davis was in America the most prominent example. His work, *Nature's Divine Revelations* (New York, 1847), was alleged to have been dictated in "clairvoyant" trance. Many reputed "clairvoyants" developed into mediums. The movement spread like an epidemic. There is very little evidence to show that it arose anywhere spontaneously[1], but those who sat with the Foxes were often found to become mediums themselves and then in their turn developed mediumship in others. The mere reading of accounts of seances seemed to develop the peculiar susceptibility in some persons, while others, who became mediums ultimately, did so only after prolonged and patient waiting.

There seems to have been little practical interest in spiritualism in Europe till Mrs Hayden, a professional medium from Boston, came over in 1852. It spread like wildfire within a few months of her arrival,—its first development being in the form of a mania for table-turning, which seems to have prevailed all over Europe in 1853.

[1] It is possible that the family of Dr Phelps were unaware of the "Rochester knockings" when the disturbances began in his house at Stratford, Connecticut, in 1850 (see Capron's *Modern Spiritualism, its Facts*, &c.); but these disturbances, as recorded, have a closer resemblance to the ordinary occurrences at a spiritualistic seance than those which took place at Tedworth in 1661 (see Glanvill's *Sadducismus Triumphatus*) and at Slawensik in 1806 (see Kerner's *Seherin von Prevorst*), and others too numerous to mention.

Daniel Dunglas Home, the next medium of importance who appeared in London, came over from America in 1855. But it was at Keighley in Yorkshire that spiritualism as a religious movement first made any mark in England, and it was there that the first English spiritualistic periodical, the *Yorkshire Spiritual Telegraph*, was started in 1855. The extent to which the movement has spread and the present number of spiritualists are very difficult to estimate. Vague calculations have from time to time been attempted: in 1867 one spiritualist estimated the number in America at 11,000,000 or two-fifths of the population, and another has held 3,000,000 to be an extreme estimate (see *Spiritual Magazine* for 1867). The periodicals devoted to spiritualism may perhaps be taken to indicate the present state of the movement. There are in England two weekly newspapers, *Light* and *The Medium and Daybreak*; one of these has advertisements of Sunday meetings in sixty different towns and in eighty different rooms. The spiritualistic journals outside Great Britain number about 100, though probably only about a quarter of these are of any importance. Of these 30 are in English (26 published in America and 4 in the Australian colonies), 15 to 20 in French, and 6 in German. But nearly 40 are published in Spanish in Spain and South America. Private circles which meet regularly are believed to be numerous in England; and there are numerous public and semi-public trance-speaking and clairvoyant mediums, especially among the miners in the north.

In the present article it is impossible to give an exhaustive catalogue of the phenomena and modes of communication of modern spiritualism. Many have not now appeared for the first time in history, though it is difficult to suppose any historical connexion between the new developments and the old. Perhaps the most striking parallelism is that between the proceedings at modern seances and those connected with the later Greek oracles.[2] The greater part of the phenomena may be divided into two classes. To the first and earliest developed class belong what may be called the physical phenomena of spiritualism,—those, namely, which, if correctly observed and due neither to conscious or unconscious trickery nor to hallucination on the part of the observers, exhibit a force hitherto unknown to science, acting in the physical world otherwise than through the brain or muscles of the medium. The earliest of these phenomena were the raps already spoken of and other sounds occurring without apparent physical cause, and the similarly mysterious movements of furniture and other objects; and these were shortly followed by the ringing of bells and playing of musical instruments. Later followed the appearance of lights; quasi-human voices; musical sounds, produced, it is supposed, without instruments; the "materialization" or presence in material form of what seem to be human hands and faces, and ultimately of complete figures, alleged to be not those of any person present, and sometimes claimed by witnesses as deceased relatives; "psychography," or "direct writing and drawing," asserted to be done without human intervention; "spirit-photography," or photographing of human and other forms invisible to all but specially endowed seers; unfastening of cords and bonds; elongation of the medium's body; handling of red-hot coals; and the apparent passage of solids through solids without disintegration. The phenomena observed at Tedworth belong to this class. Somewhat similar was the Cock Lane ghost in 1762.[3] A practice of causing heavily loaded tables to rise by "magic" seems to have existed among the German Jews in the 17th century.[4] Kerner records movements

of objects in connexion with Madame Hauffe in 1825-28,[1] and such movements also occurred in presence of the so-called electric girl in 1846.[2] The second class of phenomena, which we may call the automatic, consists in table-tilting and turning with contact, writing, drawing, &c., through the medium's hand, convulsive movements and involuntary dancing, entrancement, trance-speaking, and personation by the medium of deceased persons, attributed to temporary "possession"; seeing spirits and visions and hearing phantom voices. This class bears affinity to some of the phenomena of hypnotism and of certain nervous complaints, to certain epidemics of the Middle Ages,[3] and to phenomena that have occurred at some religious revivals. According to quotations given by Chevreul,[4] the divining-rod was used at the end of the 17th century for obtaining answers to questions, as table-tilting now is. In a third class must be placed the cure of disease by healing mediums. This cannot well be treated apart from mesmeric healing and "faith cures" and "mind cures," and belongs to medical psychology.

The class of automatic phenomena are much the commonest. The investigations of Carpenter on unconscious cerebration and of Faraday on unconscious muscular action[5] have shown that it is not necessary to look outside the medium's own brain and organism for the explanation of such things as automatic writing and table turning. It is about the matter communicated by these means that the controversy now turns. Spiritualists maintain that true information is thus given, provably unknown to the medium or other persons present, or at least expressed in a way obviously beyond their powers to originate. Another view, which is now gaining ground, is that the information in some exceptional cases does not come from the mind of the medium, but is due to the influence wrought on his mind by that of other persons, and more than this is not proved.[6]

At no period of the spiritualistic movement has the class of physical phenomena been accepted altogether without criticism. Most spiritualists know that much fraud in connexion with them has been discovered—frequently by spiritualists themselves—and that the conditions favourable to obtaining them are often such as favour fraud. It is with a full knowledge of these difficulties in the way of investigation that they maintain that unmistakably genuine phenomena are of constant occurrence. Many volumes containing accounts of such phenomena have been printed, and appeal is often made to the mass of evidence so accumulated. "No physical science can array a tithe of the mass of evidence by which psychism" (*i.e.*, what is usually called spiritualism) "is supported," says Serjeant Cox.[7] But the majority of these accounts have scarcely any scientific value. Spiritualists have, as a rule, sought to convince not by testimony but by ocular demonstration. Yet, if there is not a mass of scientific evidence, there are a number of witnesses—among them distinguished men of science and others of undoubted intelligence—who have convinced themselves by observation of the genuineness of the phenomena,—a fact of undeniable importance, even without careful records, when the witnesses are otherwise known to be competent and trustworthy observers. Mr Maskelyne has affirmed[8] that he has witnessed table-turning where he was satisfied that there was neither trickery nor unconscious muscular action. Moreover, if the phenomena are not genuine, we have to assume a large amount of apparently aimless fraud.

Amongst the proposed explanations of these phenomena that of hallucination need not detain us long. Sensory hallucination of several persons together who are not in a hypnotic state is a rare phenomenon, and therefore not a probable explanation. Moreover, it cannot be regarded as being generally applicable, partly because material traces of what occurs often remain, and partly because of the general agreement not only of all the witnesses but of all the senses as to what is perceived, as distinguished from what is inferred. Nevertheless something of the kind may occasionally have happened, especially at some of the seances of Home.[9] If collective hallucination really occurs at seances, it is a very interesting fact, and deserves to be carefully studied.

What may broadly be called conjuring is, however, a much more probable explanation of most of the recorded phenomena, and in the vast majority of cases the witnesses do not seem to have duly appreciated the possibilities of conjuring, nor to have taken sufficient precautions to exclude it. Besides, not even a conjuror knows all the possibilities of his art and can describe in detail all the accidental circumstances which may on any particular occasion favour deception, and perhaps never exactly recur. We require, therefore, to know not only that the witness is careful and accurate but that he has allowed a sufficiently wide margin for the possibilities of conjuring; and some leading spiritualists do not allow this. It is often urged that mediums are not conjurors because they frequently fail, whereas "imposture can be reproduced at will," and because they can produce the phenomena in private rooms, and under conditions which exclude the possibility of conjuring. But the phenomena produced by mediums in private rooms would generally be uninteresting and unsuited to public performance, so that it would not pay a professional conjuror to practise them. Amateur conjurors might do something in this way, and the present writer has seen one imitate successfully some of the phenomena of professional mediums for "direct writing"; but to compete with mediums on really equal terms the conjuror must have the same conditions throughout, and this is difficult to arrange, since it involves securing witnesses who are doubtful as to whether what they see is conjuring or not. Still more important to the conjuror is that very privilege of failing whenever he pleases, so largely used by mediums, that he may avail himself of accidental opportunities for trickery, which would be interfered with by a settled programme. The extent to which the absence of programme obtains at seances appears from the following statement by a leading spiritualist who writes under the *nom de plume* of "M. A. (Oxon.)":—"In 99 out of every 100 cases people do *not* get what they want or expect. Test after test, cunningly devised, on which the investigator has set his mind, is put aside, and another substituted."[10] In other words, the evidence is rarely strictly experimental, and this not only gives facilities for fraud but makes it necessary to allow a much larger margin for accidents, mistakes, and mal-observation. It must be borne in mind that the most excellent moral character in the medium is no guarantee against trickery, unless it can be proved that he was in no abnormal mental condition when the phenomena occurred; for extraordinary deceptions have been carried on by hysterical patients and others with no apparent motive but a desire to secure attention.

One of the possibilities to be allowed for is that of un-

usual muscular endowment in the medium For instance, in 1851, the remarkable loud double raps occurring in the presence of the Fox girls, which in 1849 had puzzled several investigating committees at Rochester, were explained by Professors Flint, Lee, and Coventry of Buffalo as produced by rapidly partially dislocating and restoring the knee and other joints They stated that they had experimented with another lady who could do the same, and, challenged by Mrs Fish, they tried some experiments with her and Margaretta Fox which strongly supported their view

Besides the general arguments for supposing that the physical phenomena of spiritualism may be due to conjuring, there are two special reasons which gain in force as time goes on (1) Almost every medium who has been prominently before the public has at some time or other been detected in fraud, or what cannot be distinguished from fraud except on some violently improbable hypothesis, and (2), although it is easy to devise experiments of various kinds which would place certain phenomena above the suspicion of conjuring, by eliminating the necessity for continuous observation on the part of the investigators, there is no good evidence that such experiments have ever succeeded Nevertheless there does exist evidence for the genuineness of the physical phenomena which deserves consideration Count Agénor de Gasparin, in his *Tables Tournantes* (Paris, 1854), gives an account of what seem to have been careful experiments with his own family and friends, which convinced him that by some unknown force tables could be got to move without contact He did not believe that spirits had anything to do with it His experiments were conducted in broad daylight and with sceptical witnesses (whose testimony, however, he does not give) looking on outside the circle The minutes of the sub-committee No 1 of the committee of the Dialectical Society (*op cit*, pp 373-391) report that tables moved without contact, whilst all the persons present knelt on chairs (the backs of which were turned to the table), with their hands on the backs The report, however, would be of greater value if the names of the medium and of the working members of the committee were given —we only know that of Sergeant Cox—and if they had written independent accounts of what they witnessed The conditions of some of Mr Crookes's experiments with D D Home on alterations in the weight of a partially suspended board [1] appear to have been so simple that it is difficult to imagine how the witnesses can have been deceived Some very remarkable evidence is contained in "Researches in Spiritualism during the Year 1872-3," by "M A (Oxon)," published in a spiritualistic periodical called *Human Nature*, March and August 1874 The papers give accounts of phenomena obtained through the writer's own mediumship, generally in the presence of one or two friends, and extending over almost the whole range of spiritualistic manifestations

But what chiefly interests spiritualists is the assurance of life and progress after death, and the moral and religious teaching, which they obtain through automatic writing and trance-speaking It was discovered very early in the movement that the accuracy of these communications could not always be relied on, but it is maintained by spiritualists that by the exercise of the reason and judgment, by prolonged acquaintance with particular communicating intelligences, and by proofs of identity with persons known to have been trustworthy on earth, it is possible to obtain valuable information from beings not infallible, but with the knowledge of spirit life superadded to their earthly experience Still the agreement between communications so received has not been sufficiently great for anything like a universal spiritualistic creed to have been arrived at In France the doctrine of successive reincarnations with intervals of spirit life promulgated by Allan Kardec (Leon Hippolyte Denisart Rivail) forms a prominent element of spiritualistic belief This view has, however, made but little way in England and America, where the opinions of the great majority of spiritualists vary from orthodox Christianity to Unitarianism of an extreme kind Probably it would be impossible to unite spiritualists in any creed, which, besides the generally accepted belief in God and immortality, should postulate more than the progress of the spirit after death, and the power of some of the dead to communicate with the living by means of mediums

Spiritualism has been accused of a strong tendency to produce insanity, the charge, however, seems to be in the main a mistaken inference from the fact that the delusions of the insane not unfrequently take the form of supposed converse with invisible beings It is, however, probable that the spiritualistic theories of possession and obsession sometimes injure persons with incipient insane impulses, by weakening their sense of responsibility for these and their efforts to control them Spiritualism has also been accused of fostering free love and other doctrines subversive of society But this charge too has been made without adequate grounds, for, though certain spiritualistic bodies have at times taught such doctrines, they have always been repudiated by the mass of spiritualists The great scandal of spiritualism is undoubtedly the encouragement it gives to the immoral trade of fraudulent mediumship

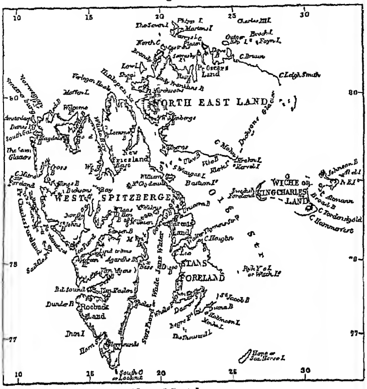
In addition to the works already mentioned, the student, for a general idea of the whole subject, should consult the following — E W Capron, *Modern Spiritualism, its Facts*, &c, Boston, 1855, for the early history of the movement in America, Edmonds and Dexter, *Spiritualism*, New York, 1854-55, R Hare, *Experimental Investigations of the Spirit Manifestations*, New York, 1856, Allan Kardec, *Livre des Esprits*, 1st ed 1853, Mrs De Morgan, *From Matter to Spirit*, London, 1863, with preface by Professor De Morgan, Alfred Russel Wallace, *Miracles and Modern Spiritualism*, 1876, M A (Oxon), *Spirit Identity* and *Spirit Teaching*, Zollner, *Wissenschaftliche Abhandlungen* (the part relating to spiritualism has been translated into English under the title *Transcendental Physics* by C C Massey) A succinct account of typical frauds of spiritualism is contained in D D Home's *Lights and Shadows of Spiritualism*, 2d ed, 1877-78 (E M S)

SPITZBERGEN This group of rocky, barren, and snowclad islands, lost in the solitudes of the Arctic Ocean, 400 miles north-north-west of the North Cape of Norway (see vol xix pl II), but nevertheless well known for at least four centuries to European whalers and seal-hunters, has of late acquired new interest from the scientific expeditions by which it has been selected either as a base for attempts to reach the north pole or as a field in which to inaugurate a new era of scientific exploration in the arctic regions From Spitzbergen Parry started in 1827 on the sledge journey which brought him within 480 miles of the pole, it was the starting-point of the investigations which led Charles Martins to his brilliant generalizations of the flora, present and past, of the earth, and numerous Swedish expeditions from 1858 onwards have accumulated an amount of knowledge, so vast and so important, as to be comparable only with the results of the great equatorial and arctic journeys of the first years of the 19th century Situation

The Spitzbergen archipelago, lying between 76° 30′ and 80° 30′ N lat and 10° and 30° E long —half-way between Greenland and Nova Zembla—consists of six large and a great number of smaller islands The chief, that of West Spitzbergen, shaped like a wedge pointed towards the south, and deeply indented on the west and north by long branching fjords, has an area of nearly 15,200 square miles High mountains, reaching 4560 feet in the Horn Sound Tind, cover its southern parts, while a wide plateau, Islands

[1] *Quart Journ of Science*, July and October 1871, republished, with other papers by Mr Crookes, under the title of *Researches on the Phenomena of Spiritualism*, 1874 76

with an altitude of from 1500 to 2000 feet and covered by a thick ice-sheet, occupies the north. Several fjords—Horn Sound, Bel Sound, Ice Fjord (15 miles wide and 80 long), and the double fjord of King's Bay and Cross Bay on the west, and Liefde, Wiide, and Lomme Bays on the north—deeply penetrate the island. One of the ramifications (Dickson Bay) of the beautiful Ice Fjord, 150 fathoms deep, nearly reaches the head of Wiide Bay, so as almost to divide the island. A long narrow island, Prince Charles's



Map of Spitzbergen

Foreland, with peaks of nearly 5000 feet high, runs parallel to part of the west coast of West Spitzbergen, from which it is separated by a narrow strait. The broad Stor (Great) Fjord, or Wiide Jans Water, separates the main island from two others to the east,—Stans Foreland (2500 square miles) and Barents Land (580 square miles). Formerly these were considered as one, and named Edge Island, until the narrow Walter Thymen Strait which parts them was discovered. A few peaks, estimated at from 1600 to 2000 feet high, protrude above the snow and ice by which these two imperfectly explored islands are covered. To the north-east of West Spitzbergen, separated from it by Hinlopen Strait (7 to 60 miles in breadth) lies North-East Land, with an area of about 6200 square miles. Its western and northern coasts are indented by several bays and fjords, the southern and eastern shores, on account of the masses of ice by which they are constantly girt, remain unexplored. This island appears like a broad plateau covered by an ice-sheet 2000 to 3000 feet in thickness, from which a few peaks protrude. Slowly moving towards the east, this immense sheet of ice discharges into the sea by a huge ice-wall, unbroken by promontories for 150 miles, thus forming the broadest glacier known,—Dickson's glacier. Eastwards from this group of islands, 100 miles to the north-east of Stans Foreland, rises another island, measuring 90 miles from west to east. Marked either Gillis's Land or Wiche's Land in earlier maps, it was seen from Spitzbergen as a snow-clad mass mingling with the fogs of the sea by a Swedish expedition, and later on by Heuglin and Zeil, but it was not until 1872 that the Norwegian whalers Altman, Johnsen, and Nilsen reached it from the east and nearly circumnavigated it. After some discussion about its name, it has received from Professor Mohn the name of King Charles Land, which is now generally accepted. The wide strait which separates it from Spitzbergen is called Olga Strait. It is now established that Gillis saw Gillis's Land to the north-east of the archipelago, and this land, which may perhaps be a link between the Spitzbergen archipelago and that of Franz-Josef, has been again sighted by Norwegian seal-hunters. Numerous small islands lie around the larger:—the Danes and Norwegians Islands on the north-west, the Seven Islands on the north, Outger Reps, Brock, and Charles XII Island on the north-east, Waygat Islands and William I Island in Hinlopen Strait, the Ryk Yse Archipelago, Hope Island, and the Thousand Islands (about a hundred small rocks) to the east and south of Stans Foreland, and many other smaller ones. Many of these small islands rise to a height of 1500 to 1700 feet.[1]

Seas round Spitzbergen. The archipelago, which has the Greenland Sea to the west and Barents Sea to the east, rises from a submarine platform that extends from Bear Island north-eastwards to Franz Joseph Land, and probably was an immense arctic continent connected with Greenland during the middle of the Tertiary period. The sea around Spitzbergen has a depth of less than 100 fathoms. Owing to this circumstance the ice readily accumulates round the shores, and, although the glaciers of Spitzbergen do not give origin to icebergs so huge as those of Greenland, the smaller icebergs and the pack-ice are thick enough to prevent access to the shores except for a few months in the year. Happily the Gulf Stream, which washes the shores of Norway, after sending a branch to the east, flows north to the western shores of Spitzbergen, moderating its climate, and leaving an open passage which permits whalers to approach the western coast even under the most unfavourable conditions of ice in the arctic regions. Drift-wood brought from lower latitudes, glass-floats of the Norwegian fishermen, and even the large seeds of the *Entada Gigalobium*, carried by the Gulf Stream from the Gulf of Mexico, are found at the northern extremity of Spitzbergen. On the other hand, a cold current charged with ice descends from higher latitudes along the eastern coast, rendering approach extremely difficult. On this account King Charles Land remained unknown until 1872, and the eastern coast of North-East Land still continues unexplored.

Climate. Owing to the warm current, the climate of Spitzbergen is less severe than in the corresponding latitudes of Greenland and Smith Sound. The isotherm of 23° Fahr. (−5° C.), which crosses the middle of Eastern Siberia, touches its southern extremity, and only the north east coasts of West Spitzbergen and North East Land have an average yearly temperature so low as 14° to 10°.5 (−10° to −11°.9 C.). At Mussel Bay (79° 53′) the average yearly temperature is 16° (January 14°.1, July 39°.3). Bear Island, notwithstanding its more southerly position, has a lower temperature, as the Gulf Stream does not touch it. Even in the coldest months of the winter a thaw may set in for a few days, but, on the other hand, snow sometimes falls in July and August. Spring comes in June, the snow becomes saturated with water and disappears in places, and scurvy grass and the polar willow open their buds. By the end of June the thermometer has ceased to sink below the freezing point at night, July, August, and September are the best months. In September, however, autumn sets in on shore, though the whalers continue cruising until the end of the month and even reach the highest latitudes. By the end of September the pack-ice rapidly freezes into one solid mass. To move on this mass, however, is exceedingly difficult, for the ice, owing to its contraction and expansion, is either intersected by large fissures or broken up and piled into heaps, which puts insuperable difficulties in the way of sledge expeditions.

Glaciers. Glaciers are largely developed. On the high grounds the snow under a level of from 1200 to 1500 feet disappears every year, but on the plateaus it continually accumulates, so as to cover them with an immense ice sheet, like that of Greenland, which slowly discharges by the valleys towards the sea in the form of immense glaciers. All North-East Land and the interior of West Spitzbergen are covered with such ice-sheets, which descend to King's

[1] Bear Island, half-way between the North Cape and Spitzbergen, can hardly be reckoned to the Spitzbergen archipelago. It was formerly renowned for its hunting grounds, but is very seldom visited now. Lying outside the course of the Gulf Stream, it is almost entirely ice-bound.

Bay by a glacier 15 miles wide, or by that already alluded to in North-East Land, where the ice-cliffs are from 200 to 400 feet high These glaciers, however, discharging into comparatively shallow waters, do not produce such icebergs as those of Greenland The glaciers of the present epoch are but trifling in comparison with what they were during the Glacial period, when the entire country was buried under an ice-sheet, which probably connected all the archipelago into one ice bound continent and spread far beyond to northern Europe

Geology The backbone of the islands consists of thick layers of granite, gneiss, and other archaic schists But more recent formations bearing witness to a much more genial climate are not wanting The Carboniferous period is represented by extensive coal-bearing strata, the lowest of which are intermediate with the Devonian (Liefde Bay strata) The Trias, also containing a rich fossil flora, is represented by black clay slate The Jurassic deposits are widely spread, they mostly belong to the Kelloway, and many of them are coal bearing To the same period belong the frequently occurring layers of what was formerly called hypersthenite, but has now been proved to be (according to Zirkel's classification) diabase and dolerite The most interesting formation is, however, the Miocene At a period close, geologically speaking, to the subsequent Glacial period, and even to our own, Spitzbergen was covered with a luxuriant vegetation the like of which is now found only in the 60th parallel in Scandinavia The shores of Bel Sound, Ice Fjord, and Cape Starostine in 78° N lat were covered with extensive peat bogs, on the edges of which the marsh cypress flowered, dropping its leaves and blossoms into the marshes *Sequoiæ*, poplars, birches, planes, and large oaks also grew there, while ivy and thick underwood freely developed under their shadow, and thousands of insects swarmed in the thicket The most striking feature of this Miocene vegetation—a feature conclusively established by the researches of Oswald Heer—is that Spitzbergen, Greenland, Franz-Josef Land, and Nova Zembla were at that time parts of one immense continent, thus realizing the very conditions for the coldest climate, if climate had to depend on telluric causes only Heer has shown, moreover, in a manner that hardly admits of doubt that the luxuriant vegetation so unmistakably borne witness to by the Miocene strata of the arctic regions could not have developed had it been condemned to endure the long arctic night it now undergoes This feature of the arctic Miocene flora is unexplained, and will remain so until higher cosmical laws are formulated to explain changes of climate A change in the position of the earth's axis of rotation (recently the subject of a serious discussion in England and on the Continent) would seem to be the only adequate hypothesis by which to account for the warm vegetation of the period in question in such proximity to the pole, but this hypothesis would be so much at variance with the present state of our knowledge that we may well hesitate to advance it A brief recurrence of a warmer climate—not nearly so warm as the Miocene, yet somewhat warmer than the present—was also experienced by Spitzbergen after the long period of glaciation as is proved by the occurrence of beds with mussels, which are now found only in much warmer latitudes This warmer Post-Glacial period—traces of which have been met with throughout the arctic and subarctic regions—was followed by a period of slow upheaval, which still continues

Flora The flora is of course poor The only tree is the polar willow, which does not exceed 2 inches in height and bears a few leaves not larger than a man's finger-nail, and the only bush is the crowberry (*Empetrum nigrum*), to which the recently discovered cloudberry (*Rubus Chamæmorus*) may be added But at the foot of the warmer cliffs some loam has been formed notwithstanding the slowness of putrefaction, and there, in contrast with the brownish lichens that cover the hills, grows a carpet of mosses of the brightest green, variegated with the golden yellow flowers of the ranunculus (*R sulphureus* and *hyperboreus*), the *Silenex*, the reddish heads of the *Pedicularis*, the *Oxyria reniformis* (a foot high), the large-leaved scurvy grass (*Cochlearia fenestrata*), several saxifrages, *Cerastium alpinum*, *Potentilla emarginata*, fox-tail grass (*Alopecurus alpinus*), *Dupontia Fischeri*, *Poa cenisia*, *pratensis*, and *stricta*, with a few large-flowered *Polygona* and *Andromedæ*, while on the driest spots yellow poppies and whitlow grasses (*Drabæ*), *Cardamine bellidifolia*, several *Dryadeæ*, &c, are found Even on the higher slopes, 1500 feet above the sea, the poppy, *Luzula hyperborea*, and *Stellaria Edwardsii* are occasionally met with Mosses, mostly European acquaintances, cover all places where peat has accumulated The slopes of the crags and the blocks of stone on the beach are sometimes entirely covered with a luxuriant moss and lichen vegetation, among the last being the so called "famine bread" (*Umbilicaria arctica*), which has maintained the life of so many arctic travellers Flowering plants are represented by as many as ninety-six species, of which eighty one grow in Greenland and sixty-nine in Scandinavia, forty-three species are alpine cosmopolites, and have been met with on the Himalayas The ferns are represented by two species [1] Although thus limited in number, the flora is suggestive

[1] According to Mr Nathorst's researches in 1882 (*Sv Vetenskaps Akad Handlingar*, xx, *Botanisches Jahrbuch*, iv), the flora of Spitzbergen is composed as follows —*Rosaceæ*, 7 species, *Saxifrageæ*, 10, *Cruciferæ*, 15, *Ranunculaceæ*, 8, *Sileneæ* and *Alsineæ*, 12, *Salix*, 2, *Compositæ*, 5, *Scrophulariaceæ*, 2, *Ericaceæ*, 2, *Gramineæ*, 23, *Cyperaceæ*, 12, *Juncaceæ*, 3, *Filices* (Ferns), 2, *Lycopodiaceæ*, 1 The whole of this flora immigrated during the Post-Glacial period, which was warmer than the present

in its distribution The vegetation of the south has a decidedly Lappish or European alpine character, while that of the north coast is decidedly American, and recalls that of Melville Island Many flowering plants which are common in north west Spitzbergen are absent from the east coast, where the cold current is inimical to both flora and fauna, but, on the other hand, one moss (*Pottia hyperborea*) and one lichen (*Usnea melaxantha*) are found there which are of American origin and grow both in North America and on the Cordilleras *Algæ* are most numerous, many, like the brown *Laminaria* and *Nostoc communis*, which fill all pools and are the chief food of many birds, being familiar in Europe *Protococcus nivalis* covers the snow with its reddish powder

Fauna. The fauna, although not very rich in species, is exceedingly rich in individuals It includes fifteen mammals, only two of which are terrestrial—the reindeer and the ice fox—besides the usual inhabitant of the arctic regions, the polar bear [2] The number of reindeer is really puzzling In a single summer, or rather in the course of a few weeks, no fewer than from 1500 to 2000 reindeer were killed by hunters for several consecutive years previous to 1868 Much emaciated in June, they grow very fat towards the end of the autumn, after feeding on the mosses Great numbers are "marked" (that is, have both ears cut at the same height), and the hunters are persuaded that these individuals come from an unknown continent in the north-east, where they have been marked by the hand of man. However strange this hypothesis, it must be acknowledged that the objections urged against it by the Swedish explorers are not conclusive, and that frost bite attacking young calves could hardly account for the symmetrical markings on both ears The immense numbers of the reindeer strongly support the idea of their migration, and the only question is whether they came from Siberia *via* Nova Zembla, or whether they did not really come from the unknown archipelagoes on the north-east, the existence of which is supported by so many other data (immobility of the ice to the east of Spitzbergen, drift ice, birds met with off North East Land, as well as several other considerations of a more general character)

Eight Cetaceans are met with in the seas off Spitzbergen, viz,—*Balænoptera boops*, 80 to 110 feet long, *B gigas* and *B rostrata*, 30 feet long, the white whale (*Beluga catodon*), three species of seals (*Phoca barbata*, *grœnlandica*, and *hispida*), and the walrus (*Trichechus* or *Odobænus rosmarus*) The Greenland whale has completely disappeared in consequence of the great havoc made during the last two centuries according to Scoresby, no less than 57,590 individuals were killed between 1669 and 1775 A perfectly reckless extermination of seals is still going on Numberless walruses tumble about in the water, or lie in crowds on the floating ice, and their number further increases when the flocks of Greenland seals arrive in August

Birds visit the archipelago in such vast flocks that the cliffs are literally covered with them The fulmar petrel (*Procellaria glacialis*)—a herald of polar regions—meets the ships approaching Spitzbergen far away from the coasts Its colonies cover the cliffs, as also do those of the glaucous gull (*Larus glaucus*), or the "burgomaster" Rotches (*Mergulus alba*), black guillemots (*Uria grylle*), ivory gulls (*Larus eburneus*), auks, and kittiwake gulls (*Larus tridactylus*) breed extensively on the cliffs, while geese, looms, and snipe swarm on and about the lagoons and small freshwater ponds The bernacle goose (*Anser bernicla*) is only a bird of passage, as it goes farther north east to nest The eider breeds in large colonies on the islands, where its young are safe from the ice fox, only the glaucous gull and the brent goose (*Bernicla brenta*) being admitted to keep them company, while the lumme (*Mormon arcticus*) and the tern confine themselves to separate cliffs These birds, however, are only guests in Spitzbergen, the snow bunting (*Emberiza nivalis*) being the only species which stays permanently, twenty-three species breed regularly on Spitzbergen, and four others (the falcon, snowy owl, swan, and skua) come occasionally

There are twenty three species of fishes, but no reptiles Insects are few *Lepidoptera* (one species), *Neuroptera* (one), *Hymenoptera* (four), and *Diptera* (twenty) have been met with by the Swedish expeditions Arachnids, and especially Pantopods, on the other hand, are very common Molluscs are also very numerous, embracing no less than 130 species In June several *Limacineæ* are met with in such numbers on the coast and at the mouth of the glacier streams as to constitute the chief food of the gulls At some places the mussels and univalves reach a comparatively colossal size and appear in incredible abundance Of Crustaceans no fewer than 100 species have been recognized in the waters of the archipelago

The marine fauna is exceedingly rich in the bluish warmer waters of the Gulf Stream, and the dredgings of the Swedish expeditions, which were prosecuted even under the ice, never failed to bring to the surface a rich variety of remarkable or new forms From a depth of 8400 feet the "bull dog" machine lifted mud of a tempera-

[2] The existence of the *Arvicola hudsonia* is not quite proved

ture of 33° Fahr (0°.3 C.) charged with Radiolarians, *Polythalamæ*, *Globigerinæ*, *Biloculinæ*, *Dentalia*, and *Nonioninæ*, together with some Annelids (*Spiochætopterus* and *Cirratulus*), two Crustaceans (*Cuma rubicunda* and *Apseudes*), one Mollusc, two *Holothuriæ*, one *Gephyrea*, and one Sponge. Even at a depth of 15,900 feet animal life was found in unexpected profusion, the mud consisting almost entirely of brown and white *Foraminiferæ*, among them one Crustacean (a species of *Cuma*). But marine life is much poorer on the east coast, resembling that of Greenland.

Man does not live on Spitzbergen, and the attempts of the Swedes to winter there have for the most part proved failures, except in the case of the "Sofia" expedition, which succeeded in wintering without great loss, though not without suffering from scurvy. None but the Russian "Pomory" (inhabitants of the Murman coast) have succeeded in enduring the arctic winters. The patriarch of Spitzbergen, the Pomor Staraschin (Starostine), spent no less than thirty-two winters (fifteen being consecutive) on the islands, dying of old age in 1826. There was a time in the 17th and 18th centuries when thousands of Dutch, Danes, and others were attracted to Spitzbergen by the whale fishing. Whole villages sprang up on the shores, the best being that of the Dutch—Smeerenberg—which is said to have been visited by 18,000 men in a single summer. The "right whale" having disappeared, the whalers ceased to visit Spitzbergen, and only quite recently an attempt has been made to renew the pursuit of the *Balænoptera boops*. The chief object of pursuit is the walrus, carried on by Norwegians; sea-birds and eider are also occasionally sought.

History. Expeditions.

History.—Spitzbergen was discovered in 1596 by William Barents, and his companion, Cornelius Rijp, is believed to have circumnavigated the archipelago. Nevertheless it was long considered as a part of Greenland, and described under the names of East Greenland, Newland, King James's Land, until the old name of Spitzbergen gained the ascendency. But long before Barents discovered it the Russians had known it under the name of Grumant (a word of unknown origin), and when Chancellor arrived at Archangel in 1553 he learned that the Russians visited Grumant for hunting purposes. After the 17th and 18th century whalers, the Russians began to visit the group, chiefly for walruses, seals, foxes, reindeer, bears, and birds; their huts and crosses are met with at very many places on the coast. Many wintered for several consecutive winters. Since 1830 their visits have almost ceased. The Norwegians began to visit the archipelago about 1795, and their small vessels now visit the Spitzbergen waters in considerable numbers. In 1822 a party wintered successfully, but later attempts have for the most part proved fatal on account of scurvy. To these experienced arctic navigators—assisted by Norwegian *savants*—we are indebted for so many important discoveries in the Barents, Kara, and Siberian Seas.

Several expeditions have made Spitzbergen their base in attempts to reach the north pole. The Russian admiral Tchitchagoff visited it twice, in 1765 and 1766, and reached 80° 28′ N. lat. John Phipps mapped the north of Spitzbergen in 1773, and reached 80° 37′ N. lat. In 1818 Buchan and Franklin reached 80° 34′ to the north of the archipelago. Clavering and Sabine in 1823 explored the islands, and Sabine made his remarkable magnetic observations, while Clavering reached 80° 20′ N. lat. Parry, shortly after his return from his third voyage, went to Spitzbergen and reached 82° 44′ N. lat. on sledges. In the same year the Norwegian geologist Keilhau visited the group and has related his experiences in a remarkable book, *Reise i Ost og West Finmarken*. The Swedish professor Lovén was the first to undertake, in 1837, dredging and geological explorations in Spitzbergen and its vicinity. Next year a body of French, Swedish, Danish, and Norwegian naturalists, among whom was Charles Martins, visited the western coast. From 1858 onwards the archipelago has been the object of a series of scientific expeditions. At the suggestion of Lovén, Otto Torell, accompanied by Nordenskjold and Quennerstedt, opened the series, making many important observations and bringing home rich geological collections. In 1861 a larger expedition led by Torell, Nordenskjold, Malmgren, Chydenius, and Petersen set out with the object of finding how far it was possible to obtain a measurement of an arc of meridian of sufficient extent. This aim was only partly accomplished, but the expedition returned with an invaluable stock of various observations. The work of the measurement of the arc was completed in 1864 by another expedition conducted by Nordenskjold, assisted by Malmgren and Dunér, who returned again with a vast number of new and important observations. This expedition was followed in 1868 by that of the "Sofia," under Nordenskjold, having on its scientific staff Holmgren, Malmgren, and F. Smitt, zoologists; Berggren and Fries, botanists; Lemström, physicist; and Nauckhoff, geologist. They were prevented by ice from getting higher than 81° 42′ N. lat.; but, to use Oswald Heer's words, the expedition "achieved more and gave a wider extension to the horizon of our knowledge than if it had returned merely with the information that the 'Sofia' had hoisted her flag on the north pole." In 1870 two young Swedish savants, Nauckhorst and Wilander, visited Spitzbergen in order to examine the phosphoric deposits, and two years later a colony was formed in Ice Fjord, and a small railway constructed to work the beds. The attempt, however, did not prove successful. Mr Leigh Smith and the Norwegian Captain Ulve visited and mapped parts of East Spitzbergen in 1871, returning with valuable information. They reached 81° 24′ N. lat. In the same year Mr Lamont visited the archipelago. In 1872 a great polar expedition set out to winter on Spitzbergen with the intention of attempting in the spring to advance towards the pole on sledges drawn by reindeer. But the expedition encountered a series of misfortunes. The ships were beset in the ice very early in Mussel Bay, and, six Norwegian fishing vessels having been likewise overtaken and shut in, the expedition had to feed the crews on its provisions and thus to reduce the rations of its own men. The reindeer all made their escape during a snow-storm; and, when the sledge party reached the Seven Islands, they found the ice so packed that all idea of going north had to be abandoned. Instead of this, Nordenskjold explored North-East Land and crossed the vast ice sheet which covers it. The expedition returned in 1873 with a fresh store of important scientific observations, especially in physics and submarine zoology. In 1873 Drasche, the geologist, paid a short visit to Spitzbergen, and the Dutch polar expedition approached it in 1882. In 1882 the Swedish geologists Naathorst and De Geer made a journey to which we are indebted for most interesting data about the flora of the islands. In the same year a polar meteorological station was established at Cape Hordsen for carrying on the observations desired by the international polar committee. The year 1883 being very favourable, the Norwegian walrus-hunters Andreasen and Johannesen pushed to the north-east of Spitzbergen and discovered new land to the north-east of the archipelago apparently extending as far as 39° E. long.

Bibliography.—The literature of the subject is very voluminous, and for full bibliographical details reference must be made to such works as Chydenius's *Svenska Expeditionen til Spetsbergen*, translated into German by Passarge (Jena, 1869); A. Leslie's *Arctic Voyages of A. E. Nordenskjold* (London, 1879); and Chavanne's *Bibliographie der Polar Regionen*, 1878. The earliest maps of Spitzbergen up to 1864 have been reprinted in a Dutch publication (*Tijdschrift van het Aardrijkskundig Genotschap te Amsterdam*, pt. iii.); it contains the maps of 1596, 1612, 1625, 1634, 1642, 1648, and so on. *Petermann's Mittheilungen*, with *Ergänzungshefte*, the *Geographische Jahrbücher*, the *Ymer* (journal of the Swedish Geographical Society), and the *Journal of the Roy. Geog. Society* contain more or less detailed accounts of all the Swedish expeditions up to date. The scientific results of the Swedish expeditions are embodied in very many papers, amounting to from 6000 to 7000 printed pages, reference to which will be found in the above mentioned works and periodicals. Oswald Heer's *Flora Fossilis Arctica* deserves special mention. Every volume of the memoirs and proceedings (*Handlingar* and *Forhandlingar*) of the Swedish Academy of Sciences contains some remarkable contributions to our scientific knowledge of the far north, and the same can be said of many volumes of the Christiania Academy of Sciences and the Swedish Geological, Botanical, and Zoological Societies. (P. A. K.)

SPLEEN. See VASCULAR SYSTEM. For diseases of the spleen, see PATHOLOGY, vol. xviii. p. 376 *sq.*; also MALARIA and WOOL-SORTER'S DISEASE.

SPOHR, LUDWIG (1784-1859), violinist and composer, was born at Brunswick on 25th April 1784, but spent his childhood at Seesen, where in 1789 he began to study the violin, and worked so industriously that at six years old he was able to take the leading part in Kalkbrenner's trios. He received his general education at the Brunswick grammar-school,—taking lessons on the violin from Kunisch and studying composition under Hartung. The little he learned from the last-named professor was the only theoretical instruction he ever received, for, as he himself tells us, he taught himself to compose by studying the scores of Mozart. After playing a concerto of his own at a school concert with marked success, he was placed for a time under Maucourt, the leader of the duke's band; and so rapid was his progress that in 1798 he was able to start on his first artistic tour. This proved a failure; but on his return to Brunswick the duke gave him an appointment in his band, and defrayed the expense of his future education under Franz Eck, in company with whom he visited St Petersburg and other European capitals. His first violin concerto was printed in 1803. In that year Spohr returned to Brunswick and resumed his place in the duke's band. A visit to Paris was prevented by the loss of his favourite violin,—a magnificent Guarnerius, presented to him in Russia. Having played in Berlin, Leipsic, Dresden, and other German towns, his increasing reputation gained for him in 1805 the appointment of leading violinist at the court of the duke of Gotha. Soon after this he married his first wife, Dorette Scheidler, a celebrated harpist. At Gotha he composed his first opera, *Die Prüfung*, but did

not succeed in placing it on the stage *Alruna* was equally unfortunate, though it was rehearsed with approval at Weimar in 1808 During this year Spohr accomplished one of the most extraordinary musical exploits on record Hearing that Talma was performing at Erfurt before the reigning princes assembled for the famous congress and failing in his attempt to obtain admission to the theatre, he bribed a horn-player to send him as his deputy, and, though he had never touched a horn in his life, he learned in a single day to play it so well that in the evening he was able to fulfil his self-imposed duty without exciting suspicion or remark Spohr's third opera, *Der Zweikampf mit der Geliebten,* written in 1809, was successfully performed at Hamburg in the following year In 1811 he produced his (first) *Symphony in E♭*, and in 1812 composed his first oratorio, *Das jungste Gericht*[1] It was while employed in the preparation of this work that he first felt the inconvenience inseparable from an imperfect theoretical education, and, with characteristic energy, he set about the diligent study of Marpurg's *Abhandlung von der Fuge*

In 1812 Sphor visited Vienna, where his splendid violin-playing created a profound sensation, and he was induced to accept the appointment of leader of the orchestra at the Theater na der Wien He then began the preparation of his greatest dramatic composition, *Faust*, which he completed in 1813, though it was not performed until five years later His strength as a composer was now fully developed, and the fertility of his imagination enabled him to produce one great work after another with astonishing rapidity He resigned his appointment at Vienna in 1815, and soon afterwards made a tour in Italy, where he performed his eighth violin concerto, the *Scena Cantante nello Stilo Drammatico*,—the finest of his compositions for his favourite instrument The performer was described by the leading critics of the country as "the finest singer on the violin that had ever been heard" On Spohr's return to Germany in 1817 he was appointed conductor of the opera at Frankfort, and in that city in 1818 he first produced his dramatic masterpiece, *Faust* The favour with which this was received led to the composition of *Zemire und Azor*, a romantic piece founded on the story of *Beauty and the Beast*, which, though by no means equal to its predecessor in merit, soon attained a much higher degree of popularity There can, indeed, be no doubt that *Faust* suffered from the very first from the weakness of its miserable libretto Had the words been worthy of the music *Faust* would have taken rank among the finest German operas in existence

Spohr first visited England in 1820, and on 6th March played his *Scena Cantante* with great success at the first Philharmonic concert At the third he produced a new *Symphony* (No 2) *in D minor*, written expressly for this occasion, which is remarkable as the first on which the conductor's *bâton* was used at a concert of the Philharmonic Society Spohr's new symphony met with an enthusiastic reception, as did the earlier one (No 1, in E♭), which was played, together with his *Nonetto*, at the last concert of the series Indeed he had a triumphant success both as composer and as *virtuoso*, and he on his side was delighted with the performances of the Philharmonic orchestra Before leaving London he gave a farewell concert, at which Madame Dorette Spohr played on the harp for the last time Her health at this period was so delicate that she was recommended to exchange her favourite instrument for the less fatiguing pianoforte, and Spohr, with his accustomed facility, wrote a number of pieces for pianoforte and violin, which the husband and wife played together with perfect artistic sympathy After supplementing his visit to England by a short sojourn in Paris, Spohr returned to Germany and settled for a time in Dresden, where German and Italian opera were flourishing side by side under the direction of Weber and Morlacchi His artistic relations with the composer of *Der Freischutz* were not altogether satisfactory, nevertheless Weber did not hesitate to recommend him strongly to the elector of Hesse Cassel as "kapellmeister" Spohr entered upon his duties at Cassel on 1st January 1822, and soon afterwards began the composition of his sixth opera, *Jessonda*, which he produced in 1823 This work—which he himself always regarded as one of his best productions—marks an important epoch in his career as a dramatic composer It was the first opera he ever wrote with accompanied recitative throughout in place of the usual spoken dialogue, and by a remarkable coincidence it was produced in the same year as Weber's *Euryanthe*, a work characterized by the same departure from established custom Unhappily Weber's early death prevented him from making a second essay in the same direction, but Spohr consistently carried out the idea in his later operas, and always with marked success

Spohr's appointment at Cassel gave him the opportunity of bringing out his new works on a grander scale and with more careful attention to detail than he could have hoped to attain in the service of a less generous patron than the elector And he never failed to use these privileges for the purpose of doing justice to the works of other composers Soon after his instalment in his new office Mendelssohn, then a boy of thirteen, visited Cassel with his father, notwithstanding the disparity of their years, a firm and lasting friendship sprang up between the rising genius and the already famous composer, which ceased only with Mendelssohn's death in 1847, and in other similar cases Spohr always proved himself ready to appreciate and foster the talent displayed by others, though it must be admitted that as a critic he was very difficult to please The success of *Jessonda* led him to produce in 1825 a seventh opera—*Der Berggeist*—founded upon the old German legend of Rubezahl, the ruling spirit of the Riesengebirge Though less popular than its predecessor, this fine work attained a very fair success But a far greater triumph awaited the composer at the Rhenish musical festival held at Dusseldorf in 1826 On this occasion his oratorio *Die letzten Dinge* met with so enthusiastic a reception that it had to be repeated a few days later for the benefit of a charity This work, known in England as *The Last Judgment,* is undoubtedly the greatest of Spohr's sacred compositions, and is remarkable as the first oratorio in which the romantic element is freely introduced, with marked success throughout, and without detriment either to the solemnity of the subject or the sobriety of style which has always been regarded as an indispensable characteristic of sacred music of the highest order In 1827 Spohr produced his eighth opera, *Pietro von Abano*, the plot of which depends for its chief interest upon the resuscitation by the famous necromancer of a lady long since dead and committed to the tomb The work met with a fair, though not a lasting, success, and the same may be said of a much finer opera, *Der Alchymist*, produced in 1830 Spohr's next publication was of a very different character His *Violin School*, produced in 1831, is so useful as a code of instruction for advanced students that there is probably no great violinist now living who has not been more or less indebted to it for the perfection of his technique. It holds with regard to the violin a position no less important than that which Cramer's *Studies* has so long held in connexion with the pianoforte

The year 1833 Spohr spent in the preparation of a new

[1] Literally *The Last Judgment*, but not to be confounded with the oratorio now so well known by that name in England

oratorio—*Des Heiland's letzte Stunden*, known in England as *Calvary* or *The Crucifixion*—which was performed at Cassel on Good Friday 1835, and sung in English at the Norwich festival of 1839, under Spohr's own direction, with such unexampled success that he was accustomed to speak of this event as the greatest triumph of his life. For the Norwich festival of 1842 he composed *The Fall of Babylon*, which also was a perfect success. His last opera, *Die Kreuzfahrer*, was produced at Cassel in 1845. Of his nine symphonies the finest, *Die Weihe der Töne*, was produced in 1832. His compositions for the violin include concertos, quartetts, duets, and other concerted pieces and solos, adapted for the chamber and the concert room, and among these a high place is taken by four double quartetts,—a form of composition of which he was both the inventor and the perfecter. He was, indeed, very much inclined to explore new paths, notwithstanding his attachment to classical form, and his freedom from prejudice was proved by the care with which he produced Wagner's *Flying Dutchman* and *Tannhäuser* at Cassel in 1842 and 1853, in spite of the elector's opposition. Spohr retained his appointment until 1857, when, very much against his wish, he was pensioned off. In the same year he broke his arm, but he was able to conduct *Jessonda* at Prague in 1858. This, however, was his last effort. He died at Cassel on 16th October 1859. (W. S. R.)

SPOLETO (Lat. *Spoletium*), a city of Italy, in Umbria, placed in a commanding position near the Via Flaminia, between Rome and Perugia, is said to have been colonized in 240 B.C. (Liv., *Epit.*, xx.; Vell. Pat., i. 14), and is called by Cicero (*Pro Balb.*, 21) "colonia Latina in primis firma et illustris." After the battle of Trasimenus (217 B.C.) Spoletium was attacked by Hannibal, who was repulsed by the inhabitants (Liv., xxii. 9). During the Second Punic War the city was a useful ally to Rome. It suffered greatly during the civil wars of Marius and Sulla. The latter, after his victory over Crassus, confiscated the territory of Spoletium and reduced it to the rank of a military colony. Under the empire it again became a flourishing town (Strabo, v. p. 227; Plin., *H.N.*, iii. 14; Ptol., iii. 1, 54). Owing to its elevated position it was an important stronghold during the Vandal and Gothic wars; its walls were dismantled by Totila (Procop., *Bell. Get.*, iii. 12). Under the Lombards Spoleto became the capital of an independent duchy (from c. 570), and its dukes ruled a considerable part of central Italy. Together with other fiefs, it was bequeathed to Pope Gregory VII. by the empress Matilda, but for some time struggled to maintain its independence. In 1881 it had a population of 7969 (commune, 21,507), many of whom are occupied in the weaving of woollen stuffs. It is the seat of an archbishopric for the three dioceses of Spoleto, Bevagna, and Trevi.

The city contains many interesting ancient remains,—traces of an early polygonal wall, a Roman theatre, and parts of three temples, built into the churches of S. Agostino, S. Andrea, and S. Giuliano. Remains of a fine Roman bridge were found a few years ago buried in the former bed of a torrent, which now runs along a different line. These remains have recently been buried again under a newly made road. On the citadel, which commands the town, still stands an ancient castle, originally built by Theodoric. This castle was mostly destroyed by the Goths, but was afterwards rebuilt and enlarged at many different times, especially by Pope Nicholas V. The existing building contains work of many different dates. The cathedral of S. Maria Assunta dates partly from the time of the Lombard duchy, but was much modernized in 1644. Over the main entrance is a very interesting and large mosaic of Christ in Majesty signed "Solsernus," 1207, at the sides are figures of the Virgin and St John. In the choir and on the half cupola of the apse are some of the finest frescos of Lippo Lippi, representing scenes from the life of the Virgin. Lippo died in 1469, leaving part of the work to be completed by his assistant Fra Diamante. The fine stalls and panelling in the choir are attributed to Bramante. The church of S. Pietro is a fine early example of Lombard architecture, though much modernized. The façade is remarkable for its rich sculptured decorations of grotesque figures, dragons, and foliage. S. Domenico is a fine example of later Italian Gothic with bands of different coloured stones. The three-apsed crypt of the church of S. Gregorio is of great interest; it probably dates from the founding of the church in the 9th century. S. Niccolo is a beautiful example of Pointed Gothic.

The city is still supplied with water by a grand aqueduct (see vol. ii. pl. IV.) across the adjacent gorge; it has stone piers and brick arches, and is about 268 feet high and 676 feet long. It is said to have been built in 604 by Theodelapius, the third Lombard duke, and the stone piers belong probably to that time. The brick arches are later restorations.

SPONGES

THE great advance which has been made during the past fifteen years in our knowledge of the sponges is due partly to the vivifying influence of the evolutional hypothesis, but still more to the opportunities afforded by novel methods of technique. To the strength and weakness of the deductive method Haeckel's work on the *Kalkschwämme* (*6*)[1] is a standing testimony, while the slow but sure progress which accompanies the scientific method is equally illustrated by the works of Schulze (*20*), who by a masterly application of the new processes has more than any one else reconstructed on a sure basis the general morphology of the sponges. In the general progress the fossil sponges have been involved, and the application of Nicol's method of studying fossil organisms in thin slices has led, in the hands of Zittel and others (*24, 35*), to a complete overthrow of those older classifications which relegated every obscure petrifaction to the fossil sponges and consigned them all to orders no longer existing. But, whilst many problems have been solved, still more have been suggested. An almost endless diversity in details differentiates the sponges into a vast number of specific forms; the exclusive possession in common of a few simple characters closely unites them into a compact group, sharply marked off from the rest of the animal kingdom.

[1] These numbers refer to the bibliography at the end of the article.

Structure and Form.

Description of a Simple Sponge.—As an example of one of the simplest known sponges we select *Ascetta primordialis* (fig. 1), Haeckel. This is a hollow vase-like sac closed at the lower end, by which it is attached, opening above by a comparatively large aperture, the *osculum* or vent, and at the sides by numerous smaller apertures or *pores*, which perforate the walls. Except for the absence of tentacles and the presence of pores it offers a general resemblance to some simple form of *Hydrozoon*. Histologically, however, it presents considerable differences, since, in addition to an endoderm and an ectoderm, a third or mesodermic layer contributes to the structure of the walls; and the endoderm consists of cells (see fig. 21*g*) each of which resembles in all essential features those complicated unicellular organisms known as choanoflagellate *Infusoria* (see PROTOZOA, vol. xix. p. 858). With this positive character is associated a negative one: nematocysts are entirely absent. The activity Simple sponge.

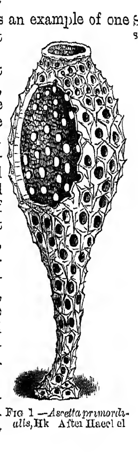


FIG. 1.—*Ascetta primordialis*, Hk. After Haeckel.

of the *Ascetta*, as of all sponges, is most obviously manifested, as Grant (*5*) first observed, by a rapid outflow of water from the oscule and a gentle instreaming through the pores,—a movement brought about by the energetic action of the flagella of the endodermic cells The instreaming currents bear with them into the cavity of the sac (paragastric cavity) both protoplasmic particles (such as *Infusoria*, diatoms, and other small organisms) and dissolved oxygen, which are ingested by the flagellated cells of the endoderm The presence of one or more contractile vacuoles in these cells suggests that they extricate water, urea, and carbonic acid The insoluble residue of the introduced food, together with the fluid excreta, is carried out through the oscule by the excurrent water New individuals are produced from the union of ova and spermatozoa, which develop from wandering amœboid cells in the mesoderm The walls of *Ascetta* are strengthened by calcareous scleres, more especially designated as spicules, which have the form of triradiate needles If we make abstraction of these we obtain an ideal sponge, which Haeckel has called *Olynthus* (*6*), and which may be re-

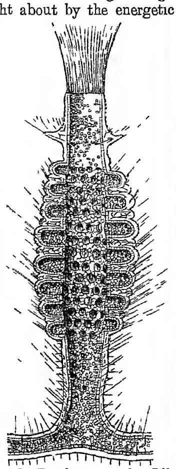

FIG 2—*Homoderma sycandra*, Lfd One half cut away by a vertical median section After V Lendenfeld (×about 6)

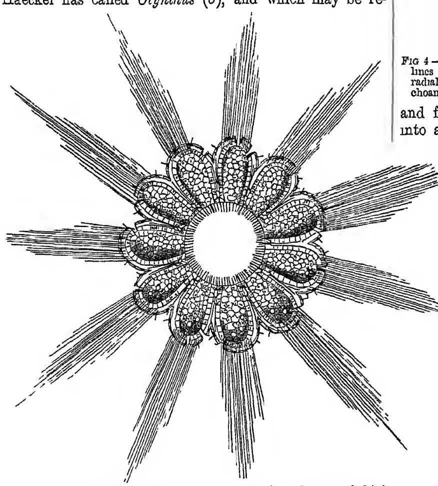

FIG 3—*Homoderma sycandra*, Lfd Transverse section, showing radial tubes opening into central paragastric cavity After V Lendenfeld (×about 12)

garded as the ancestral form from which all other sponges have been derived To give greater exactness to our abstraction we should perhaps stipulate for the *Olynthus* a somewhat thicker mesoderm and more spherical form than a decalcified Ascon presents

Canal System—We shall now trace the several modifications which the *Olynthus* has undergone as expressed in the different types of canal system

Ascon type The simple paragaster of *Ascetta* may become complicated in a variety of ways, such as by the budding off from a parent form of stolon-like extensions, which then give rise to fresh individuals, or by the branching of the Ascon sac and the subsequent anastomosis of the branches, but in no case, so long as the sponge remains within the Ascon type, does the endoderm become differentiated into different histological elements The most interesting modification of the Ascon form occurs in *Homoderma sycandra* (*12*), in which from the walls of a simple Ascon cæcal processes grow out radiately in close regular whorls, each process reproducing the structure of the parent sponge (figs 2, 3) From this it is but a short step to the important departure which gives rise to the Sycons

Sycon type In the simplest examples of this type the characters of *Homoderma sycandra* are reproduced, with the important exception that the endoderm lining the paragastric cavity of the original Ascon form loses its primitive character,

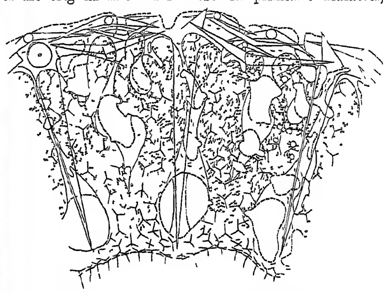

FIG 4—*Heteropegma nodus-gordii*, Pol Part of a transverse section The straight lines indicate spicules the poriferous surface is uppermost, the branching radial tubes are rendered dark by numerous small circles representing choanocytes After Polejaeff, "*Challenger*" *Report* (×50)

and from a layer of flagellated cells becomes converted into a pavement epithelium, not in any distinguishable feature different from that of the ectoderm. The flagellated cells are thus restricted to the cæcal outgrowths or radial tubes Concurrently with this differentiation of the endoderm a more abundant development of mesoderm occurs In some Sycons (*Sycaltis*, Hk) the radial tubes remain separate and free, in others they lie close together and are united by trabeculæ, or by a trabecular network, consisting of mesodermic strands surrounded by ectoderm (fig 4) The spaces between the contiguous radial tubes thus become converted into narrow canals, through which water passes from the exterior to enter the pores in the walls of the radial tubes These canals are the "intercanals" of Haeckel, now generally known by their older name of *incurrent* canals The openings of the incurrent canals to the exterior are called pores, a term which we have also applied to the openings which lead directly into the radial tubes or paragastric cavity, to avoid ambiguity we shall for the future distinguish the latter kind of opening as a *prosopyle* The term "pore" will then be restricted to the sense in which it was originally used by Grant The mouth by which a radial tube opens into the paragaster is known as a *gastric ostium* In the higher forms of Sycons the radial tubes no longer arise as simple outgrowths of the whole sponge-wall, but rather as outgrowths

of the endoderm into the mesoderm, which, together with the ectoderm, exhibits an independent growth of its own; and this results in the formation of a thick investment, known as the *cortex* (fig. 5), to the whole exterior of the

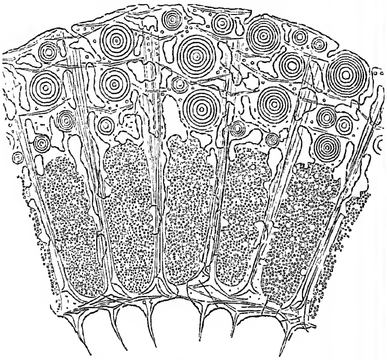

Fig. 5.—*Ute Argentea*, Pol. Part of a transverse section. The concentric circles, indicating transverse sections of spicules, lie within the cortex. After Polejaeff, "*Challenger*" *Report* (×100).

sponge. The radial tubes may branch, *Heteropegma* (fig. 4). If the branches are given off regularly, as the radial tubes were in the first plan, and if at the same time the original radial tube exchanges its flagellated for a pavement epithelium, a structure as shown in fig. 6 (*Polejna*

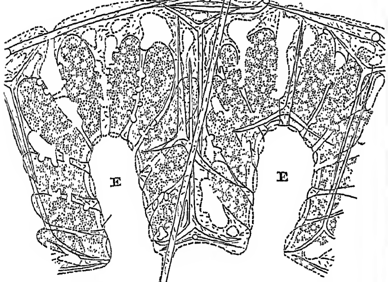

Fig. 6.—*Polejna connexiva*, Pol. Part of a transverse section. *E*, excurrent canals, into which the flagellated chambers open. After Polejaeff, "*Challenger*" *Report* (×50).

connexiva, Pol.) will result. This form might also be brought about by unequal growth of the gastral endoderm leading to a folding of the inner part of the sponge-wall. Very little direct evidence exists as to which of these two plans has actually been followed. Phylogenetically the transition from a simple Ascon to the most complicated Sycon can be traced step by step; and ontogeny shows that such a Sycon form as *Grantia raphanus* passes through an Ascon phase in the course of its larval development.

Rhagon type. Returning to the ancestral form of sponge, *Olynthus*, let us conceive the endoderm growing out into a number of approximately spherical chambers, each of which communicates with the exterior by a prosopyle and with the paragastric cavity by a comparatively large aperture, which we may term for distinction an *apopyle*; at the same time let the endoderm lose its flagellated character and become converted into a pavement epithelium, except in the spherical chambers. Such a form, called by Haeckel "dyssycus," may be more briefly named a *Rhagon* from the grape-like form of its flagellated chambers, which differ from those of a Sycon both by their form and their smaller dimensions. The Rhagon occurs as a stage in the early development of *Plakina monolopha* (Schulze) and *Reniera fertilis* (*9*) (fig. 7); a calcareous sponge which appears to

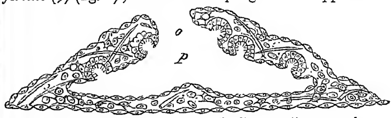

Fig. 7.—Vertical section of a Rhagon, partly diagrammatic. *o*, oscule; *p*, paragaster. After Keller (× about 100).

approach it somewhat is *Leucopsis pedunculata*, Lfd. By the folding of the wall of a Rhagon, or by its outgrowth into lobes, a complicated structure such as that of *Plakina monolopha* (*20*) (see fig. 26 *f*) results. This is character-

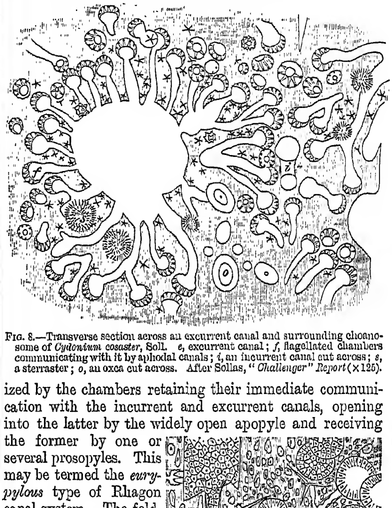

Fig. 8.—Transverse section across an excurrent canal and surrounding choanosome of *Cydonium cosaster*, Soll. *e*, excurrent canal; *f*, flagellated chambers communicating with it by aphodal canals; *i*, an incurrent canal cut across; *s*, a sterraster; *o*, an oxea cut across. After Sollas, "*Challenger*" *Report* (×125).

ized by the chambers retaining their immediate communication with the incurrent and excurrent canals, opening into the latter by the widely open apopyle and receiving the former by one or several prosopyles. This may be termed the *eurypylous* type of Rhagon canal system. The folding of the sponge-wall may be simple, as in the example given, or too complex to unravel. In higher forms of sponges (*Geodinidæ*, *Stellettidæ*) the chambers cease to open abruptly into the excurrent canals: each is prolonged into a narrow canal, *aphodus*, or *abitus*, which usually directly, sometimes after uniting with one or more of its fellows, opens into an excurrent canal. The prosopyles, now restricted to one for each chamber, may remain unchanged in character, or at the most be prolonged into very short

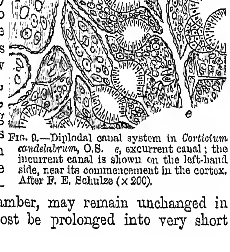

Fig. 9.—Diplodal canal system in *Corticium candelabrum*, O.S. *e*, excurrent canal; the incurrent canal is shown on the left-hand side, near its commencement in the cortex. After F. E. Schulze (×200).

tubes, each a *prosodus* or *aditus* (fig 8). This may be termed the *aphodal* or *racemose* type of Rhagon system, since the chambers at the ends of the aphodi radiating from the excurrent canal look like grapes on a bunch. As Haeckel, however, has used "racemose" in a different sense, we shall adopt here the alternative term. By the extension of the prosodal or adital canals into long tubes a still higher differentiation is reached (fig 9). This, which from the marked presence of both prosodal and aphodal canals may be termed the *diplodal* type of the Rhagon canal system, occurs but rarely. *Chondrosia* is an example.

The following scheme will render clear the foregoing distinctions:—

1. Ascon type: simple, ex. *Ascetta*, Hk.; strobiloid, ex. *Homoderma*, Lfd.
2. Sycon type: simple radial tubes, ex. *Sycetta*, Hk.; branched radial tubes (cylindrical chambers), ex. *Heteropegma*, Fl.; chamber-layer folded, ex. *Polejna*, Pol.
3. Rhagon type: eurypylous, with several prosopyles to each chamber, ex. *Spongelia*; with a single prosopyle to each chamber, ex. *Oscarella*, *Thenea*; aphodal, aphodal canals well developed, ex. *Geodia*, Lmk.; diplodal, with both aphodal and prosodal canals well developed, ex. *Chondrosia*, O.S.

In the case of the calcareous sponges Polejaeff has argued forcibly that the eurypylous type arises directly from the Sycon and not from the Rhagon. It is therefore doubtful how far the Rhagon in other sponges is a primitive form derived directly from an *Olynthus*, or whether it may not be a secondary larval state resulting from the abbreviated development of a former Sycon predecessor. Whatever may have been its past history, the Rhagon serves now at all events as a starting-point for the development of the higher forms of canal system.

Subdermal cavities.

In the higher Rhagons, as in the Sycons, further complications ensue, owing to an independent growth of the external ectoderm and the adjacent mesoderm. While the endoderm, with its associated mesoderm, is growing out or folding to form the excurrent canal system, the superficial mesoderm increases in thickness, and the ectoderm, extending laterally from the sides of the incurrent sinuses, burrows into it, parallel to the surface of the sponge. Thus it forms beneath the skin (*i.e.*, the layer of superficial mesoderm and investing ectoderm) cavities which may be either simple and spacious or be broken up into a number of labyrinthine passages by a network of mesoblastic strands (invested with ectoderm) which extend irregularly from roof to floor of the chamber. These cavities are known as *subdermal chambers*.

Ectosome, choanosome.

With the appearance of subdermal chambers the sponge becomes differentiated into two almost independent regions, an outer or *ectosome* and an inner or *choanosome*, which is characterized by the presence of flagellated chambers. The ectosome forms the roof and walls of the subdermal chambers, and is in its simplest form merely an investing skin; but in a large number of sponges it acquires considerable thickness and a very complicated histological structure. It is then known as a *cortex*. The thickening which gives rise to a cortex takes place chiefly beneath those parts of the skin which are not furnished with pores. Beneath the pores—in this case collected into sieve-like areas—dome-like cavities are left in the cortex; they open freely into the subdermal cavities below and their roof is formed by the cribriform pore membrane above. In many sponges (*Geodia*, *Stelletta*) the cortical domes are constricted near their communication with the subdermal cavity (subcortical crypt) by a transverse muscular sphincter, which defines an outer division or *ectochone* from an inner or *endochone* (fig 10), the whole structure being a *chone*.

Chone.

The endochone is frequently absent (fig 10). The early development of the cortex has scarcely yet been studied. In *Stelletta phrissens* (Soll.), one of the "Challenger" *Stellettidæ*, an early form of the sponge (fig 11), shows the choanosome already characteristically folded within the cortex, which forms a complete not-folded envelope around it. The roots of the incurrent sinuses form widely open spaces immediately beneath the cortex and are the rudiments of subcortical crypts. Again, in some sponges a part of the endoderm and associated mesoderm may likewise develop independently of the rest of the sponge, as in the *Hexactinellida*, where the choanosome forms a middle layer between a reticulation of ectosome on the one side and of endoderm and mesoderm, *i.e.*, *endosome*, on the other. Finally, the attached or lower half of a Rhagon may develop in an altogether different manner from the other or upper half, the endoderm not producing any flagellated chambers. In this case the upper portion alone is characterized by the flagellated chambers, which are the distinctive mark of a sponge, and hence may be called the *spongomere*; the lower half, which consists of all three fundamental layers, may be called the *hypomere*.

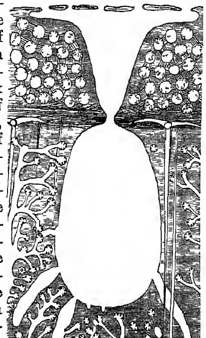

Fig. 10.—Section through the cortex of *Cydonium eosaster*, Soll., showing the pore-sieve overlying the chone, which communicates through a sphincterate aperture with the subcortical crypt, lying in the choanosome with its flagellated chambers. The dotted circles in the cortex are sterrasters connected by fibrous strands. After Sollas, "*Challenger*" *Report* (×73).

Endosome.

Fig. 11.—Young sponge of *Stelletta phrissens*, Soll. Longitudinal median section, showing the choanosome folded within the cortex. *o*, oscule. After Sollas, "*Challenger*" *Report* (×50).

Oscule.

The form and general composition of sponges are exceedingly various and often difficult to analyse, presenting, along with some important differences, a remarkable general resemblance to the *Cœlentera* in these respects. Like them, some sponges are simple, and others, through asexual multiplication, compound. The only criterion by which the individual sponge can be recognized is the osculum; and, as it is frequently difficult, and in many cases impossible, to distinguish this from the gastric opening of a large excurrent canal, there are many cases in which the simple or compound nature of the sponge must remain open to doubt. The oscule may also fail (*lipostomosis*), and so may the paragastric cavity (*lipogastrosis*); the problem then becomes insoluble. The loss of the oscule

may in some cases be due to the continued growth of several endodermal folds towards the exterior, with a corresponding absorption of the mesoderm and ectoderm which lie in the way, till the folds penetrate to the ectoderm and open at the exterior, thus giving rise to excurrent openings, which are not readily distinguishable from pores At the same time the original osculum closes up and entirely disappears Lipogastrosis, on the other hand, may be produced by the growing together of the roots of the choanosomal folds, thus reducing the paragastric cavity to a labyrinth of canals, which may easily be confounded with the usual form of excurrent canals While in some sponges the original oscule is lost, in others secondary independent openings, deceptively like oscules, are added This pseudostomosis is due to a folding of the entire sponge, so as to produce secondary canals or cavities, which may be incurrent (*vestibular*) or excurrent (*cloacal*), the opening of the latter to the exterior being termed a *false oscule* or *pseudostome* The faulty use of the term oscule for what is neither functionally nor morphologically a mouth is here obvious, for in one sense the oscule is always a pseudostome, it would be better if the term *pseudoproct* could be substituted

Skeleton *Skeleton* —All sponges, except three or four genera belonging to the *Myxospongiæ*, possess some kind of skeletal structures They may be either calcareous or silicious or horny scleres, the latter usually having the form of fibres, which sometimes enclose silicious needles (spicules) or foreign bodies introduced from without Foreign bodies also contribute to the formation of the skeleton of some silicious sponges, and occasionally form the entire skeleton, no other hard parts being present

Mineral spicules Mineral scleres usually occur in the form of spicules The spicules of calcareous sponges consist of carbonate of lime, having the crystalline structure and other properties of calcite (*29*) Each spicule, so far as its mineral component is concerned, is a single crystal, all the molecules of calcite of which it is built up being similarly oriented On the other hand, its form and general structure are purely organic Its surfaces are always curved, and usually it has the form of a cone or combination of cones, each of which consists of concentric layers of calcite surrounding an axial fibre of organic matter,—probably of the same nature as spongiolin or spongin, the chief constituent of the fibres of horny sponges A thin layer of organic matter, known as the *spicule sheath*, forms an outer investment to the spicule and is best rendered visible as a residue by removing the calcite with weak acid Silicious spicules consist of colloid silica or opal, and hence can be distinguished from calcareous by having no influence upon polarized light Structurally the two kinds of spicules present no important difference The spicules of different sponges differ greatly both in form and in size They may be conveniently divided into two groups,—minute or flesh spicules, which usually serve as the support of a single cell only (*microscleres*), and larger or skeletal spicules, which usually contribute to the formation of a more or less consistent skeleton (*megascleres*) The distinction is not one that can be exactly defined, and must so far be regarded as of a provisional nature There is usually but little difficulty in applying it in practice, except in some doubtful cases where large spicules do not form a continuous skeleton, or in others where flesh spicules appear to be passing into those of larger size It is indeed highly probable that all large spicules have originated from flesh spicules (*12*)

Megascleres (1) *Monaxon Biradiate Type* (*rhabdus*) —By far the commonest form is the oxea, a needle-shaped form pointed at both ends and produced by growth from a centre at the same rate in opposite directions along the same axis It is therefore uniaxial and equibiradiate (fig 12 *a*) (2) *Monaxon Uniradiate Type* (*stylus*) —By the suppression of one of the rays of an oxea, an acuate spicule or stylus results (fig 12 *b*) (3) *Triaxon Triradiate Type* —Linear growth

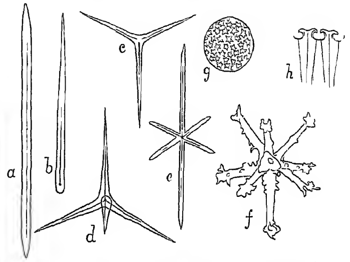

FIG 12 —Typical megascleres *a*, rhabdus (monaxon diactine), *b*, stylus (monaxon monactine), *c*, triod (triaxon triactine), *d*, calthrops (tetraxon tetractine), *e*, triaxon hexactine, *f*, desma of an anomocladine Lithistid (polyaxon), *g*, sterraster (polyaxon), *h*, radial section through the outer part of *g*, showing two actines soldered together by intervening silica, the free ends terminating in recurved spines and the axis traversed by a central fibre

from a centre in three directions inclined at an angle of 120° to each other gives rise to the primitive form of triradiate spicule so eminently characteristic of the calcareous sponges, but by no means confined to them (fig 12 *c*) (4) *Tetraxon Quadriradiate Type* (*Calthrops*) —Growth from a centre in four directions inclined at about 110° to each other produces the primitive quadriradiate form of the *Tetractinellida* and of some calcareous sponges (fig 12 *d*) (5) *Sexradiate Type* —Growth in six directions along three rectangular axes produces the primitive sexradiate spicule of the *Hexactinellida* sponges (fig 12 *e*) (6) *Multiradiate Type* —Extensions radiating in many directions from a centre produce a stellate form (fig 12 *f*) (7) *Spherical Scleres* —Concentric growth of silica about an organic particle produces the sphere, which occurs as a reduction of the rhabdus in some species of *Pœcillastra*, or as an overgrown globule (flesh spicule) in *Caminus*.

Uniaxial type Usually conical, the spicular rays often become cylindrical, usually pointed (*oxeate*) at the ends, they are also frequently rounded off (*strongylate*), or thickened into knobs (*tylotate*), or branched (*cladose*) Their growth is not always rigorously confined to a

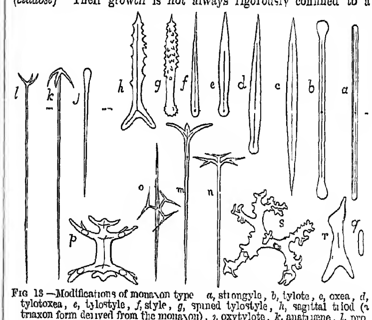

FIG 13 —Modifications of monaxon type *a*, strongyle, *b*, tylote, *c*, oxea, *d*, tylotoxea, *e*, tylostyle, *f*, style, *g*, spined tylostyle, *h*, sagittal triod (a triaxon form derived from the monaxon), *j*, oxytylote, *k*, anatriæne, *l*, protriæne, *m*, orthotriæne, *n*, dichotriæne, *o*, centrotriæne, *p*, amphitriæne (this is trichocladose), *q*, crepidial strongyle (basis of Rhabdocrepid Lithistid desma), *r*, young form of Rhabdocrepid desma, showing crepidial strongyle coated with successive layers of silica, *s*, Rhabdocrepid desma fully grown The dotted line through the upper figures marks the origin of the actines

straight line frequently they are curved or even undulating They are also liable to become spined, either by mere superficial thickening or by a definite outgrowth involving the axial fibre (fig 13 *g*, *h*) The rhabdus if pointed at both ends is known as an *oxea* (fig 13 *c*), if rounded at both ends as a *strongyle* (fig 13 *a*), if knobbed

at both ends as a *tylote* (fig 13 *b*), the tylote if pointed at one end is a *tylotoxea* (fig 13 *d*), the strongyle similarly becomes a *strongyloxea* These last two forms are with difficulty distinguished from the stylus, which is usually pointed at the end, and strongylate (fig 13 *f*) or tylotate (fig 13 *e*) about the origin A particular case of the cladose rhabdus, but one of the most frequent occurrence, is the *triæne*, in this form one ray of a rhabdus ends in three branches, which diverge at equal angles from each other The rhabdus then becomes known as the shaft or *rhabdome*, and the secondary rays are the arms or *cladi*, collectively the head or *cladome* of the spicule The arms make different angles with the shaft when recurved a grapnel or *anatriæne* is produced (fig 13 *k*), when projecting forwards a *protriæne* (fig 13 *l*), and when extended at right angles an *orthotriæne* (fig 13 *m*) The arms of a triæne may bifurcate (*dichotriæne*) once (fig 13 *n*), twice, or oftener, or they may trifurcate Again, they may extend laterally into undulating lamellæ, or unite to form a disk, the triæne character of which is indicated by the included axial fibre The shaft may also become trifid at both ends, *amphitriæne* (fig 13 *p*), and the resulting rays all bifurcate, or the cladome may arise from the centre of the rhabdome, *centrotriæne* (fig 13 *o*) Amongst one group of Lithistid sponges (*Rhabdocrepida*) the normal growth of a strongyle is arrested at an early stage, it then serves as a nucleus upon which further silica is deposited, and in such a manner as to produce a very irregularly branching sclere or desma (fig 13 *s*), within which the fundamental strongyle can be seen enclosed In such a desma no axial fibre besides that of the enclosed strongyle is formed

Triradiate type The chief modification of the triradiate spicule is due to an elongation of one ray, distinguished as *apical*, the shorter paired rays being termed *basal*, and the whole spicule a sagittal triradiate The angle included by the basal rays is usually over 120° (fig 14 *a*)

Quadriradiate type Some or all of the rays of the primitive calthrops (fig 14 *b*) may

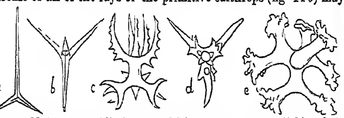

FIG 14 —Modifications of the triaxon and tetraxon types *a*, sagittal triradiate or triod, *b*, calthrops, *c*, candelabra (a polycladose microcalthrops), *d*, a spined microcalthrops, *e*, Tetracladine Lithistid desma

subdivide into a number of terminal spines *candelabra* (fig 14 *c*), or some or all of them may bifurcate once or twice and finally terminate by subdividing into numerous variously shaped processes, such a *tetracladine* desma (fig 14 *e*) characterizes one division of the Lithistid sponges

Sexradiate type By the excess or defect of one or more rays a series of forms such as are represented in fig 15 arise In the oxea, which results from

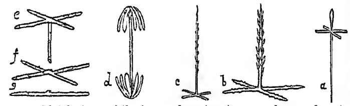

FIG 15 —Modifications of the triaxon hexactine type *a*, dagger, *b*, *c*, two varieties of pinnulus, *d*, amphidisk, *e*, pentactine, *f*, staurus, *g*, dermal rhabdus After Schulze

the suppression of all rays but two, the sexradiate character is sometimes preserved by the axial fibre, which gives off two or four processes in the middle of the spicule where the defective arms would arise Let fig 12 *c* represent a regular sexradiate spicule with its four horizontal arms extended beneath the dermis of its sponge, the over-development of the proximal ray and a reduction of the distal ray produce a form known as the *dagger* (fig 15 *a*), the suppression of the proximal ray and the development of spines projecting forwards on the distal ray produce the *pinnulus* (fig 15 *b*, *c*), the suppression of both proximal and distal rays gives the *staurus* (fig 15 *f*), and the suppression of two of the remaining horizontal rays a dermal rhabdus (fig 15 *g*) The suppression of a distal ray, excessive development of a proximal ray, and recurved growth of the remaining rays produce an *anchor* In *Hyalonema* (glass rope sponge) anchors over a foot long occur, but their arms or teeth are not restricted to four, and the axial fibre gives off its processes before reaching the head of the spicule Such a grapnel helps to support the sponge in the ooze of the sea bed Other characteristic

FIG 16 —*a*, uncinaria, *b*, clavula, *c*, scopularia After Schulze

istic spicules belonging to sponges distinguished by sexradiate spicules are the following —the *uncinaria* (fig 16 *a*), a spinose oxea with the spines all pointing one way, the *clavula*, a tylotate form with a toothed margin to the head (fig 16 *b*), the *scopularia* (fig 16 *c*), a besom-shaped spicule with tylotate rays, which vary in number from two to eight, the *amphidisk* (fig 15 *d*), a shaft terminating at each end in a number of recurved rays When the sexradiate spicules of the *Hexactinellida* unite together in a manner to be described later, the rays may be bent in a variety of ways out of the triaxial type, so that the sexradiate character alone remains

Multiradiate type *Multiradiate Type* —The rays of an aster as of other spicules may be spined or tylotate In one remarkable form known as a *sterraster* (fig 12 *g*, *h*), and characteristic of the family *Geodinidæ*, the rays are almost infinite in number, and coalesced for the greater part of their length, the distal ends, however, remain separate, and, becoming slightly tylotate, are produced into four or five recurved spines, which give attachment to connective tissue fibres by which adjacent sterrasters are united together

In one aberrant group of Lithistid sponges (*Anomocladina*) the skeleton is formed of desmas, which are multiradiate, each presenting a massive centrum (with an included cavity) produced into a variable number (4 to 8) of rays, which rays terminate in expanded ends (fig 12 *f*)

Microscleres It is doubtful whether a distinction between megascleres and microscleres can be maintained in the calcareous sponges, unless the minute oxeas which occur in *Eilhardia schulzei*, Pol (*16*), are to be referred to this group They are widely distributed throughout the silicious sponges, and by their different forms afford characters of the highest importance in classification

One of the simplest forms is the *sigmaspire* (fig 17 *a*, *b*), it looks like the letter C or S, according to the direction in which it is

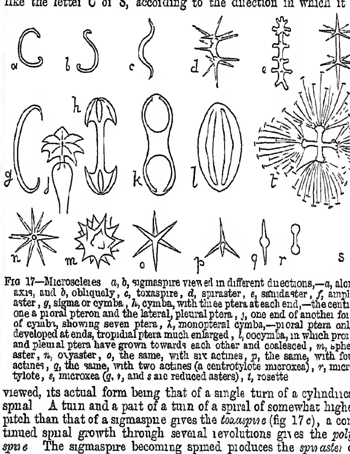

FIG 17—Microscleres *a*, *b*, sigmaspire viewed in different directions,—*a*, along axis, and *b*, obliquely, *c*, toxaspire, *d*, spiraster, *e*, sanidaster, *f*, amphiaster, *g*, sigma or cymba, *h*, cymba, with three ptera at each end,—the central one a proral pteron and the lateral, pleural ptera, *j*, one end of another form of cymba, showing seven ptera, *k*, monopteral cymba,—proral ptera only, developed at ends, tropidial ptera much enlarged, *l*, oocymba, in which proral and pleural ptera have grown towards each other and coalesced, *m*, spheraster, *n*, oxyaster, *o*, the same, with six actines, *p*, the same, with four actines, *q*, the same, with two actines (a centrotylote microxea), *r*, microtylote, *s*, microxea (*q*, *r*, and *s* are reduced asters), *t*, rosette

viewed, its actual form being that of a single turn of a cylindrical spiral A turn and a part of a turn of a spiral of somewhat higher pitch than that of a sigmaspire gives the *toxaspire* (fig 17 *c*), a continued spiral growth through several revolutions gives the *polyspire* The sigmaspire becoming spined produces the *spiraster* or *spinispirula* (fig 17 *d*), this, by losing its curvature, becomes the *sanidaster* (fig 17 *e*), and by simultaneous concentration of its spines into a whorl at each end, the *amphiaster* (fig 17 *f*) By reduction of the spire the spiraster passes into the *stellate* or *aster* (fig 17 *n*) A thickening about the centre of the aster produces the *spheraster* (fig 17 *m*), allied to which is the sterraster. By a reduction in the number of its rays the aster becomes a minute calthrops, from which, by increased growth, the skeletal calthrops may very well be derived, by further reduction to two rays a little rhabdus or microrabd results, and of this numerous varieties exist, of which the oxeate microrabd is the most interesting, since it only differs in size from the commonest of all skeletal spicules, the oxeate or acerate rhabdus The sigmaspire is formed as a superficial spiral thickening in the wall of a spicule cell or scleroblast, as superficial deposits also the next group of spicules, the so-called *anchorates*, arise Take a hen's egg as the model of a scleroblast, draw round it a broad meridional band, interrupted only on one side, for 30° above and below the equator, this will represent a truly C shaped spicule, which differs from a sigmaspire by the absence of spiral twist It may be termed a *cymba* (fig 17 *g*) The back of the "C" is the *keel* or *tropis*, the points are the *proras* or *proræ* Now broaden out the prora on the eggshell into oval lobes (*proral pteres*), and from each pole draw a lobe midway between the prora and the tropis (*pleural pteres*), and a common form of anchorate, the *pterocymba*

results (fig. 17 *h*). The pterocymba is subject to considerable modifications: the prows may be similar (*homoproral*) or dissimilar (*heteroproral*); the pteres may be lamellar or ungual; additional lamellæ (*tropidial pteres*) may be produced by a lateral outgrowth of the keel (fig. 17 *k*); and by growing towards the equator the opposed proral and pleural pteres may conjoin, producing a spicule of two meridional bands (*oocymba*; fig. 17 *l*). A curious group of flesh spicules are the *trichites*. In this group silica, instead of being deposited in concentric coatings around an axial fibre, forms within the scleroblast a sheaf of immeasurably fine fibrillæ or trichites, which may be straight (fig. 17 *m*) or twisted. The trichite sheaf may be regarded as a fibrillated spicule. Trichite sheaves form in some sponges, as *Dragmastra* (25), a dense accumulation within the cortex. In Hexactinellid sponges the rays of the aster are limited to six, arranged as in a primitive sexradiate spicule, but divided at the ends into an indefinite number of slender filaments, which may or may not be tylotate, *rosettes* (fig. 17 *t*).

Spongin scleres.

Spongin is a horny substance, most similar to silk in chemical composition, from which it differs in being insoluble in an ammoniacal solution of copper sulphate (cuproso-ammonium sulphate). In *Darwinella aurea*, F. Müller, it occurs in forms somewhat resembling tri-, quadri-, and sex-radiate spicules. But usually the spongin skeleton takes the form of fibres, consisting of a central core of soft granular substance around which the spongin is disposed in concentric layers, forming a hollow cylinder (fig. 23 *b*). The relative diameters of the soft core and of the spongin cylinder differ greatly in different sponges. The fibres branch so as to form antler-like twigs or bushy tree-like growths, or anastomose to form a continuous network, as in the bath sponge (*Euspongia officinalis*). The detailed characters of the network differ with the species, and are useful in classification. In *Ianthella* certain cells (sponginblasts) become included between the successive layers of the spongin cylinder, and their deep violet colour, contrasting with the amber tint of the spongin, renders them very conspicuous.

Union of scleres into a skeleton.

In some sponges the scleres are simply scattered through the mesoderm and do not give rise to a continuous skeleton,—*Corticium*, *Chondrilla*, *Thrombus*. In the *Calcarea* and many silicious sponges they are dispersed through the mesoderm, but so numerously that by the overlapping of their rays a loosely felted skeleton is produced. In the calcareous sponges the spicules are frequently regularly disposed; and in the Sycons in particular a definite arrange-

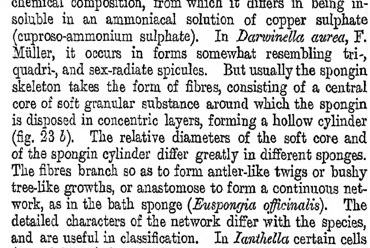

FIG. 18.—Articulate and inarticulate tubar skeletons of calcisponges. *a*, articulate; *b*, inarticulate skeleton. After Haeckel.

ment, on two plans, the *articulate* and *inarticulate*, can be traced in the skeleton of the radial tubes. On the latter plan the triradiate or quadriradiate spicules, the apical rays of which are of considerable length, are arranged in two sets, one having the basal rays lying in the mesoderm of the paragastral wall and the other with the corresponding rays in the dermal mesoderm. The apical rays of each set lie in the mesoderm of the radial tubes parallel to their length, but pointing in opposite directions (fig. 18 *b*). In the articulate division numerous spicules, small in comparison with the size of the radial tubes, form a series of rows round the tubes, their basal rays lying parallel to the paragastric surface and the apical pointing towards the ends of the radial tubes (fig. 18 *a*).

In the *Silicispongia* sheaves of long oxeate spicules radiate from the base of the sponge if of a plate-like form, or from the centre if globular, and extend to the surface. If triænes are present their arms usually extend within the mesoderm immediately below the dermal surface (fig. 19). Single spicules reach from centre to surface only in small sponges. As the sponge increases in size the spicules must either correspondingly lengthen, or fresh spicules must be added, if a continuous skeleton is to be formed. The latter is the plan followed in fact: the additional spicules overlap the ends of those first formed like the fusiform cells in a woody fibre. With the formation of a fibre, often strengthened by spongin or bound together with connective tissue, there appears to be a tendency for the constituent spicules to diminish in size, and the length of each in the most markedly fibrous sponges is insignificant when compared with the length of the fibre. The spicular fibre thus formed may be simple or echinated by spicules either similar to those which form its mass or different. More usually they are different, and generally styles, often spinose about their origin. The spongin which sometimes cements together the spicules of a fibre may progressively increase in quantity and the spicules diminish in number, till a horny fibre containing one or more rows of small oxeas results. In an echinated fibre the axial spicules may disappear and the echinating spicules persist. Finally all spicules may be suppressed and the horny fibre of the Ceratose sponges results. The horny fibres may next acquire the habit of embedding foreign bodies in their substance, though foreign enclosures are not confined to the *Ceratosa* but occur in some *Silicispongiæ* as well. The included foreign bodies may increase in quantity out of all proportion to the horny fibres; and finally the skeleton may consist of them alone, all spongin matter having disappeared.

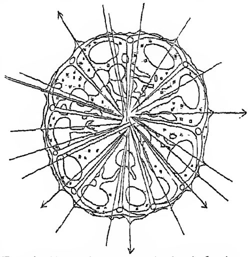

FIG. 19.—Mode of arrangement of spicules in a young Stellettid sponge, *Dragmastra normani*, Soll. After Sollas.

In the Lithistid sponges a skeleton is produced by the articulation of desmas into a network. The rays of the desmas (figs. 12 *f*, 13 *s*, 14 *c*) terminate in apophyses, which apply themselves to some part of adjacent desmas, either to the centrum, shaft, arms, or similar apophyses, and then, growing round them like a saddle on a horse's back, clasp them firmly without anchylosis. Thus they give rise to a rigid network, in conjunction with which fibres composed of rhabdus spicules may exist. In the *Hexactinellida* both spicular felts and fibres occur, and in one division (*Dictyonina*) a rigid network is produced, not, however, by a mere clasping of apophyses, but by a true fusion. The rays of adjacent spicules overlap and a common investment of silica grows over them.

Histology.

Ectoderm.

The ectoderm usually consists of simple pavement epithelial cells (*pinnacocytes*), the margins of which can be readily rendered visible by treatment with silver nitrate, best by Harmer's method.[1] The nucleus and nucleolus are usually visible in preparations made from spirit specimens, the nucleus being often readily recognizable by its characteristic bulging beyond the general surface. In some sponges (*Thecaphora*) the epithelium may be replaced locally by columnar epithelium, and the cells of both pavement and columnar epithelium may bear flagella (*Aplysilla violacea*, *Oscarella lobularis*).

Endoderm.

The endoderm presents the same characters as the ectoderm, except in the Ascons and the flagellated chambers of all other sponges, where it is formed of collared flagellated cells or *choanocytes*,—cells with a nearly spherical body in which a nucleus and nucleolus can be distinguished and one or more contractile vacuoles. The endoderm extends distally in a cylindrical neck or *collum*, which terminates in a long flagellum surrounded by a delicate protoplasmic frill or collar (fig. 21 *g*). In *Tetractinellida*, and probably in many other sponges—certainly in some—the collars of contiguous choanocytes coalesce at their margins so as to produce a fenestrated membrane, which forms a second inner lining to the flagel-

aphodal canal system the flagellated chambers usually pass gradually into the aphodal canal, but the incurrent canal enters abruptly This abrupt termination of the incurrent canal appears to mark the termination of the ectoderm and the commencement of the endoderm The flagellated chambers differ greatly in size in different sponges, and evidently manifest a tendency to become smaller as the canal system increases in complexity, thus Sycon are always larger than Rhagon chambers, and eurypylous than aphodal Rhagon chambers

Mesoderm

In most sponges except the Ascons the mesoderm is largely developed, and in many it undergoes a highly complex histological differentiation In its commonest and simplest form it consists of a clear, colourless, gelatinous matrix in which irregularly branching stellate cells or connective tissue corpuscles are embedded, these may be termed *collencytes* (fig 21 *a*) and the tissue *collenchyme* In the higher sponges (*Geodia*, *Stelletta*) it consists of small polygonal granular cells either closely contiguous or separated by a very small quantity of structureless jelly, and in this form may be termed *sarcenchyme* (fig 20) Collenchyme does not originate through the transformation of sarcenchyme, as one might expect, for it precedes the latter in development Schulze (*20*), who has compared collenchyme to the gelatinous tissue which forms the chief part of the umbrella of "jelly-fish," describes it as becoming granular immediately in the neighbourhood of the flagellated chambers in the bath sponge, the granules becoming more numerous in sponges in which the canal system acquires a higher differentiation, till at length the collencytes are concealed by them According to this view, sarcenchyme would appear to originate from a densely granular collenchyme Amœboid wandering cells or *archæocytes* (fig 22) are scattered through the matrix of the collenchyme They evidently serve very different purposes, some appear to act as carriers of nourishment or as scavengers of useless or irritant foreign matter, others may possibly contribute to the formation of higher tissues, some certainly becoming converted into sexual products Their parentage and early history are unknown

A tissue (*cystenchyme*) which in some respects resembles certain forms of vegetable parenchyme occurs in some sponges, particularly *Geodinidæ* and other *Tetractinellida*. It consists of closely adjacent large oval cells, with thin well-defined walls and fluid contents Somewhere about the middle of the cell is the nucleus with its nucleolus, supported by protoplasm, which extends from it in fine threads to the inner side of the wall, where it spreads out in a thin investing film (fig 21 *c*) Cystenchyme very commonly forms a layer just below the skin of some *Geodinidæ*, particularly of *Pachymatisma*, and, as on teasing the cortex of this sponge a large number of refringent fluid globules immiscible with water are set free, it is just possible that it is sometimes a fatty tissue, and if so the contained oil must be soluble in alcohol, for alcoholic preparations show no trace of it A tissue resembling cartilage, *chondrenchyme*, occurs in *Corticidæ* (fig 21 *b*)

Desmacytes

Connective-tissue cells or *desmacytes* are present in most sponges, they are usually long fusiform bodies, consisting of a clear, colourless, often minutely fibrillated sheath, surrounding a highly refringent axial fibre, which stains deeply with reagents (fig 21 *d*) In other cases the desmacyte is simply a fusiform granular cell, with a nucleus in the interior and a fibrillated appearance towards the ends The desmacytes are gathered together, their ends overlapping, into fibrous strands or felted sheets, which in the ectosome of some sponges may acquire a considerable thickness, often constituting the greater part of the cortex. The spicules of the sponge often furnish them with a surface of attachment, especially in the *Geodinidæ*, where each sterraster of the cortex is united to its neighbours by desmacytes, in the manner shown in fig 10

Myocytes

Contractile fibre cells or *myocytes* occur in all the higher sponges They appear to be of more than one kind Most usually they are fine granular fusiform cells with long filiform terminations, and with an enclosed nucleus and nucleolus (fig 21 *e*) In the majority of sponges both excurrent and incurrent canals are constricted at intervals

by transverse diaphragms or *vela*, which contain myocytes concentrically and sometimes radiately arranged. The excessive development of myocytes in such a velum gives rise to muscular sphincters such as those which close the chones of many corticate sponges, such as *Pachymatisma*. In this sponge, which occurs on the British shores, the function of the oscular sphincters can be readily demonstrated, since irritation of the margin of the oscule is invariably followed after a short interval by a slow closure of the sphincter.

Æsthacytes. Supposed sense-cells or *æsthacytes* (fig. 22) were first observed by Stewart and have since been described by Von Lendenfeld (*12*). According to the latter, they are spindle-shaped cells, 0·01 mm. long by 0·002 thick; the distal end projects beyond the ectodermal epithelium in a fine hair or palpocil; the body is granular and contains a large oval nucleus; and the inner end is produced into fine threads, which extend into the collenchyme and are supposed—though this is not proved—to become continuous with large multiradiate collencytes, which Von Lendenfeld regards as multipolar ganglion cells (fig. 22).

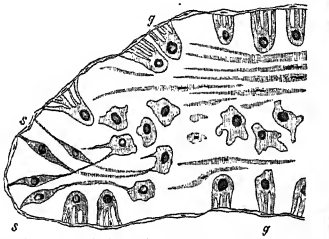

FIG. 22.—Transverse section through the edge of a pore in *Dendrilla cavernosa*, Lfd.; cells in the middle to the right, archæocytes; fusiform cells on each side of them, myocytes; *g*, above and below these, with processes terminating against the epithelium, gland cells; fusiform cells terminating against the epithelium at *s*, æsthacytes; at their inner ends these are continuous with ganglion cells. After Von Lendenfeld (× 800).

More recently he has described an arrangement of these cells curiously suggestive of a sense-organ. Numerous æsthacytes are collected over a small area, and at their inner ends pass into a granular mass of cells with well-marked nuclei, but with boundaries not so evident; these he regards as ganglion cells. From the sides of the ganglion other slender fusiform cells, which Von Lendenfeld regards as nerves, pass into the mesoderm, running tangentially beneath the skin. The inner end of the ganglion is in communication with a membrane formed of fusiform cells which Von Lendenfeld regards as muscular. If his observations and inferences are confirmed, it is obvious that we have here a complete apparatus for the conversion of external impressions into muscular movements.

Protoplasmic continuity. In most sponges a direct connexion can be traced by means of their branching processes between the collencytes of the mesoderm and the cells of the ectodermal and endodermal epithelium and the choanocytes of the flagellated chambers. As the collencytes are also united amongst themselves, they place the various histological constituents of the sponge in true protoplasmic continuity. Hence we may with considerable probability regard the collencytes as furnishing a means for the transmission of impulses: in other words, we may attribute to them a rudimentary nervous function. In this case the modification of some of the collencytes in communication with the ectoderm might readily follow and special æsthacytes arise. Fusiform collencytes perpendicular to the ectoderm, and with one end touching it, are common in a variety of sponges; but it is difficult to trace the inner end into connexion with the stellate collencytes, so that precisely in those cases in which it would be most interesting to find such a connexion absolute proof of it is wanting.

Pigment cells. The colour of sponges usually depends on the presence of cells containing granules of pigment; though dispersed generally through the mesoderm, these cells are most richly developed in the ectosome. Pigment granules also occur in the choanocytes of some sponges,—*Oscarella lobularis* and *Aplysina aerophoba*, for instance. In the latter the pigment undergoes a remarkable change of colour when the sponge is exposed to the air, and finally fades away. In many cases sponges borrow their colours from parasitic algæ (*Oscillatoria* and *Nostoc*) with which they are infested. The colours of sponge-pigments are very various. They have been examined by Krukenberg and Merejknovsky. Zoonerythin, a red pigment of the lipochrome series, is one of the most widely diffused; it is regarded as having a respiratory function. Reserve cells or *thesocytes* (fig. 21 *f*) have been described in several sponges as well as amylin and oil-bearing cells.

Scleroblasts. Each spicule of a sponge originates in a single cell (fig. 21 *h-n*), within which it probably remains enclosed until it has completed its full growth; the cell then probably atrophies. During its growth the spicule slowly passes from the interior to the exterior of the sponge, and is finally (in at least some sponges, *Geodia*, *Stelletta*) cast out as an effete product. The sponge is thus constantly producing and disengaging spicules; and in this way we may account for the extraordinary profusion of these structures in some modern marine deposits and in the ancient stratified rocks. Within the latter these deciduous spicules have furnished silica for the formation of flints, which have been produced by a silicious replacement of carbonate of lime (*26*).

The horny fibres of the *Ceratosa* are produced as a secretion of cells known as *sponginblasts*, which surround as a continuous mantle the sides of each growing fibre, and cover in a thick cap each growing point (fig. 23). The

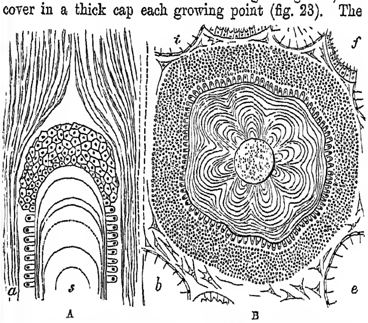

FIG. 23.—Section through the horny fibre and associated tissues of a horny sponge (*Dendrilla*). A, longitudinal section; *s*, layers of spongin, surrounded at the sides by the lateral mantle of sponginblasts, and at the ends by the terminal cap. A desmachymatous sheath, *a*, surrounds the whole (×150). B, transverse section; in the centre is the soft core, surrounded by wavy spongin layers, the outermost being surrounded by sponginblasts, and these by a fibrous sheath; *i*, part of an incurrent canal lined by flagellated epithelium; *e*, part of an excurrent canal; *f*, part of a flagellated chamber (×150). After Von Lendenfeld.

lateral sponginblasts are elongated radially to the fibre; the terminal cells are polygonal and depressed. The latter give rise to the soft granular core and the former to the spongin-walls of the fibre. Cells similar to the lateral sponginblasts, and regarded as homologous with them, occur in a single layer just below the outer epithelium of some horny sponges (*Aplysilla* and *Dendrilla*), and under certain circumstances secrete a large quantity of slimy mucus (*11*).

Classification

Classification. The phylum *Parazoa* or *Spongiæ* consists of two main branches, as follows:—

Branch A.—*MEGAMASTICTORA.*	Branch B.—*MICROMASTICTORA.*
Class CALCAREA, Grant.	Class I.—MYXOSPONGIÆ, Haeckel.
Order 1.—*Homocœla*, Pol.	Order 1.—*Halisarcina.*
Order 2.—*Heterocœla*, Pol.	Order 2.—*Chondrosina.*
	Class II.—SILICISPONGIÆ.
	Sub-class i.—HEXACTINELLIDA, O. Schmidt.
	Order 1.—*Lyssacina*, Zittel.
	Order 2.—*Dictyonina*, Zittel.
	Sub-class ii.—DEMOSPONGIÆ, Sollas.
	Tribe *a*.—Monaxonida.
	Order 1.—*Monaxona.*
	Order 2.—*Ceratosa*, Grant.
	Tribe *b*.—Tetractinellida, Marshall.
	Order 1.—*Choristida*, Sollas.
	Order 2.—*Lithistida*, O. S.

Position in animal kingdom. By the possession of both sexual elements and a complex histological structure, and in the character of their embryological development, the sponges are clearly separated from the *Protozoa*; on the other hand, the choanoflagellate character of the endoderm, which it retains in the flagellated chambers throughout the group without a single exception, as clearly marks them off from the *Metazoa*. They may therefore be regarded as a separate phylum derived from the choanoflagellate *Infusoria*, but pursuing for a certain distance a course of development parallel with that of the *Metazoa*.

Different views have been propounded by other authors. Savile Kent regards the sponges as *Protozoa* (*10*); Balfour suggested that they branched off from the Metazoan phylum at a point below the *Cœlentera*, and considered them as intermediate between *Protozoa* and *Metazoa*; Schulze regards them as derived from a simple ancestral form of *Cœlentera* (*23*); Marshall advocates the view that they are degraded forms derived from Cœlenterates which were already in possession of tentacles and mesenteric pouches (*14*).

Subdivision in groups. As a phylum the *Spongiæ* are certainly divisible into two branches, one including the *Calcarea* and the other the remaining sponges, which Vosmaer has termed *Non-Calcarea*, and others *Plethospongiæ*. Since, however, the choanocytes of the *Calcarea* are usually, if not universally, larger than those of other sponges, we may make use of this difference in our nomenclature, and distinguish one branch as the *Megamastictora* (μαστίκτωρ, "scourger") and the other as the *Micromastictora*.

Branch A.—*MEGAMASTICTORA.*

Sponges in which the choanocytes are of comparatively large size, 0.005 to 0.009 mm. in diameter (Haeckel, *6*).

Class CALCAREA.

Calcarea. *Megamastictora* in which the skeleton is composed of calcareous spicules.

Order 1. HOMOCŒLA.—*Calcarea* in which the endoderm consists wholly of choanocytes. Examples: *Leucosolenia*, Bwk.; *Homoderma*, Lfd.

Order 2. HETEROCŒLA.—*Calcarea* in which the endoderm is differentiated into pinnacocytes, which line the paragastric cavity and excurrent canals, and choanocytes, which are restricted to special recesses (radial tubes or flagellated chambers). Examples: *Sycon*, O. S.; *Grantia*, Fl.; *Leuconia*, Bwk.

Branch B.—*MICROMASTICTORA.*

(*Non-Calcarea*, Vosmaer; *Plethospongiæ*, Sollas.) Sponges in which the choanocytes are comparatively small, 0.003 mm. in diameter.

Class I. MYXOSPONGIÆ.

Myxospongiæ. *Micromastictora* in which a skeleton or scleres are absent.

Order 1. HALISARCINA.—*Myxospongiæ* in which the canal system is simple, with simple or branched Sycon or eurypylous Rhagon chambers. An ectosome sometimes and a cortex always absent. Examples: *Halisarca*, Duj.; *Oscarella*, Vosm.; *Bajalus*, Lfd.

Order 2. CHONDROSINA.—*Myxospongiæ* in which the canal system is complicated, with diplodal Rhagon chambers and a well-developed cortex. Example: *Chondrosia*, O. S.

The *Halisarcina* are evidently survivals from an ancient and primitive type. The simplicity of the canal system is opposed to the view that they are degraded forms; we may therefore regard the absence of scleres as a persistent primary and not a secondary acquired character. They are as interesting, therefore, from one point of view (absence of scleres) as the Ascons are from another (undifferentiated endoderm). With the *Chondrosina* the case is different; they differ only from *Chondrilla* and its allies by the absence of asters; these differ only from the *Tethydæ* by the absence of strongyloxeas; and we may very reasonably assume that in these three groups we have a series due to loss of characters, the *Chondrillæ* being reduced *Tethydæ* and the *Chondrosina* reduced *Chondrillæ*. Still as Huxley has well remarked, "classification should express not assumptions but facts"; and therefore till we are in possession of more direct evidence it will be well to exclude the *Chondrosina* from the *Silicispongiæ*.

Class II. SILICISPONGIÆ.

Micromastictora possessing a skeleton or scleres which are not calcareous.

Sub-class i. HEXACTINELLIDA.

Silicispongiæ characterized by sexradiate silicious spicules. Canal system usually simple, with Sycon chambers. Sponge differentiated into ecto-, choano-, and endosome. *Hexactinellida.*

Order 1. LYSSACINA.—*Hexactinellida* in which the skeleton is formed of separate spicules, or, if united, then by a subsequent not a contemporaneous deposit of silica. Examples: *Euplectella*, Owen; *Asconema*, S. Kent; *Hyalonema*, Gray; *Rossella*, Crtr.

Order 2. DICTYONINA.—*Hexactinellida* in which the sexradiate spicules are cemented together by a silicious deposit into a continuous network *pari passu* with their formation. Examples: *Farrea*, Bwk.; *Eurete*, Marshall; *Aphrocallistes*, Gray; *Myliusia*, Gray; *Dactylocalyx*, Stutchbury.

The *Hexactinellida* are a very sharply defined group, impressed with marked archaic features. No other *Silicispongiæ* possess, so far as is known, so simple a syconate canal system. The oldest known fossil sponge is a member of the *Lyssacina* (*7* and *24*), viz., *Protospongia*, Salter, from the Menevian beds, Lower Cambrian, St David's Head, Wales. The group is almost world-wide in distribution, chiefly affecting deep water, from 100 to 300 fathoms, but often extending into abyssal depths; occasionally, however, though rarely, it frequents shallow water (*Cystispongia superstes* dredged off Yucatan in 18 fathoms).

Sub-class ii. DEMOSPONGIÆ.

Silicispongiæ in which sexradiate spicules are absent. *Demospongiæ.*

Tribe *a*. *MONAXONIDA.*

Demospongiæ in which the skeleton consists either of silicious spicules which are not quadriradiate, or of horny scleres or included foreign bodies, or of one or more of these constituents in conjunction.

Order 1. MONAXONA.—The skeleton is characterized by either uniaxial or polyaxial spicules. Examples: *Amorphina*, O. S. ("crumb of bread" sponge); *Spongilla*, Lmk. ("freshwater" sponge); *Chalina*, Bwk.; *Tethya*, Lmk.

Order 2. CERATOSA.—The skeleton consists of horny scleres which never include "proper" spicules, or of introduced foreign bodies, or of both these in conjunction. Examples: *Darwinella*, F. Muller; *Euspongia*, Bronn (the "bath" sponge).

Tribe *b*. *TETRACTINELLIDA.*

Demospongiæ possessing quadriradiate or triæne spicules or Lithistid scleres (desmas).

Order 1. CHORISTIDA.—*Tetractinellida* with quadriradiate or triæne spicules, which are never articulated together into a rigid network. Examples: *Tetilla*, O. S.; *Thenea*, Gray; *Geodia*, Lmk.; *Dercitus*, Gray.

Order 2. LITHISTIDA.—*Tetractinellida* with branching scleres (desmas), which may or may not be modified tetrad spicules, articulated together to form a rigid skeleton. Triæne spicules may or may not be present in addition. Examples: *Theonella*, Gray; *Corallistes*, O. S.; *Azorica*, Crtr.; *Vetulina*, O. S.

This large sub-class embraces the great majority of existing sponges. Its external boundaries are fairly well defined, its internal divisions much less so, as its various orders and families pass into each other at many points of contact. Although there does not appear to be much resemblance between a Lithistid sponge, such as *Theonella*, a Monaxonid such as *Amorphina*, and an ordinary "bath" sponge (*Euspongia*), yet between these extremes a long series of intermediate forms exists, so nicely graduated as to render their disruption into groups by no means an easy task. If the delimitation of orders is difficult, that of genera is often impossible, so that they are reduced to assemblages depending on the tact or taste of the author. Thus Polejaeff states that with a single exception "none of the genera of *Ceratosa* are separable by absolute characters." The chief spicules of *Monaxona* are uniaxial, often accompanied by characteristic microscleres. Although distinguished as a group by the absence of quadriradiate or triæne spicules, two exceptions are known in which these occur (*Tricentrion*, Ehlers, and *Acarnus*, Gray); these, however, present unusual characters which suggest an independent origin. The canal system of *Monaxona* has not yet been fully investigated; it appears usually to follow the

eurypylous Rhagon type, but the aphodal is not unknown The *Ceratosa* contain all sponges with a horny skeleton, except those in which the horny fibres are cored or spined with siliceous spicules secreted by the sponge ("proper" spicules), these are arbitrarily assigned to the *Monaxona* There is convenience in this proceeding, for horny matter is widely disseminated throughout the *Demospongiæ*, occurring even in the *Lithistida*, and it frequently serves to cement the oxeate spicules of the *Monaxona* into a fibre, without at the same time forming a preponderant part of the skeleton It would be wellnigh impossible to say where the line should be drawn between a fibre composed of spicules cemented by spongin and one consisting of spongin with embedded spicules, while there is comparatively no difficulty in distinguishing between fibres containing spicules and fibres devoid of them That the distinction, however, is entirely artificial is shown by the fact that, after spicules have disappeared from the horny fibre, they may still persist in the mesoderm, thus Von Lendenfeld announces the discovery of micro scleres (cymba) in an Aplysillid sponge and of strongyles in a *Cacospongia*, both horny sponges (A form intermediate between this Aplysillid and the *Desmacidonidæ* would appear to be *Toxo chalina*, Ridley) The *Ceratosa* frequently enclose sand, *Foraminifera*, deciduous spicules of other sponges and of compound Ascidians, and other foreign bodies within the horny fibres of their skeleton, they also sometimes attach this material, probably by a secretion of spongin, to their outer surface, and thus invest themselves in a thick protective crust. In some *Ceratosa* no other skeleton than that provided by foreign enclosures is present The canal system is syconate or eurypylous in the simpler forms and diplodal in the higher The *Monaxonida* make their earliest appearance in the Silurian rocks (*Climacospongia*, Hinde), and are now found in all seas at all depths. The only sponges inhabiting fresh water belong to this group The *Tetractinellida* adhere to the *Monaxonida* at more than one point, and one of these groups has probably been a fruitful parent to the other, but which is offspring and which parent is still a subject for discussion The *Choristida* in its simplest forms presents a eurypylous Rhagon system, in the higher an aphodal system It is in this group that the most highly complex cortex is met with, in the *Geodinidæ*, for instance, it consists usually of at least five distinct layers Thus, proceeding outwards, next to the choanosome is a layer of thickly felted desmachyme, passing into collenchyme on its inner face, then follows a thick stratum of sterrasters united together by desmacytes, this is succeeded by a layer of cystenchyme or other tissue of variable thickness, external to this is a single layer of small granular cells and associated dermal asters, and finally, the surface is invested by a layer of pavement epithelium The *Lithistida*, like the *Ceratosa*, are possibly of polyphyletic origin, in one group (*Tetracladina*) the articulated scleres are evidently modified calthrops spicules (see fig 14 *e*), and associated with them are free triænes, which support the dermis and resemble precisely the triænes of the *Choristida* In another group (*Rhabdocrepida*) the scleres are moulded on a Monaxonid base (see fig 13 *q s*), but, associated with them, triænes sometimes occur similar to those of the *Tetracladina* Both these groups are in all probability derived from the *Choristida*, and a distinct passage can be traced from the Tetracladose to the Rhabdocrepid group In the *Rhabdocrepida* we find forms without triænes, these may possibly be degenerate forms The third group of Lithistids is derived from the *Rhabdo crepida*, the Anomocladine desma being derivable from the Rhabdocrepid by a shortening of the main axis into a centrum The thick centrum, from which the arms, variable in number, originate, is hollowed out by a cavity, which appears during life to have been occupied by a large nucleus, like that of a scleroblast, and it is quite conceivable that the scleroblast, which in the Tetracladine Lithistids lies in an angle between the arms, may have become enclosed in an overgrowth of silica, from which additional arms were produced The constancy with which spicules in other sponges maintain their independence is very striking When once a persistent character like this is disturbed, excessive variability may be predicted, as in the Anomocladine scleres

Classification in families

The classification of the sponges into families is shown in the following scheme

Class *CALCAREA*

Order 1 **HOMOCŒLA**, Pol

Family 1. ASCONIDÆ, Hk —*Homocœla* which are simple or composite, but never develop radial tubes. Examples *Ascetta*, Hk (fig 1), *Leucosolenia*, Bwk

Family 2 HOMODERMIDÆ, Lfd —*Homocœla* with radial tubes Example *Homoderma*, Lfd. (figs 3, 4)

Order 2 **HETEROCŒLA**, Pol

Tribe *a* †SYCONARIA [1]

The flagellated chambers are either radial tubes or cylindrical sacs

Family 1 SYCONIDÆ —The radial tubes open directly into the paragastric cavity

Sub-family *a* **Syconina** —The radial tubes are free for their whole length, or at least distally Examples *Sycetta*, Hk , *Sycon*, O S

Sub-family *b* **Uteina**, Lfd —The radial tubes are simple and entirely united The ectosome is differentiated from the choanosome and sometimes develops into a cortex Examples *Grantessa*, Lfd , *Ute*, O S (fig 5), *Sycortusa*, Hk , *Amphoriscus*, Pol

Sub-family *c* **Grantina**, Lfd —The radial tubes are branched The incurrent canal system is consequently complicated An ecto some is present Examples. *Grantia*, Fl , *Heteropegma*, Pol (fig 4), *Anamaxilla*, Pol

Family 2 SYLLEIBIDÆ, Lfd —The choanosome is folded The flagellated chambers (which are partly rhagose in *Vosmaeria*) communicate with the paragastric cavity by excurrent canals Examples *Polejna*, Lfd (fig 6), *Vosmaeria*, Lfd

Family 3 TEICHONELLIDÆ, Carter —Composite *Sylleibidæ* with the oscules and pores occurring on different parts of the surface Example *Teichonella*, Crtr

Tribe *b* †LEUCONARIA

The canal system belongs to the eurypylous Rhagon type

Family 1 LEUCONIDÆ, Hk —The outer surface is not differentiated into osculiferous and poriferous areas Examples *Leucetta*, Hk , *Leucaltis*, Hk , *Leucortis*, Hk

Family 2 EILHARDIDÆ, Pol —Composite *Leuconaria*, with the outer surface differentiated into special osculiferous and poriferous areas Example *Eilhardia*, Pol

The arrangement adopted above is founded on Von Lendenfeld's revision (*11*) of the classification propounded by Polejaeff (*16*), who in a masterly survey has thrown an unexpected light on the structure and inter-relationships of a group which Haeckel has rendered famous It should not be overlooked that Vosmaer (*31*) had previously explained the structure of the Leucones However erroneous in detail, Haeckel's views are confirmed in their broad outlines, and it was with true insight that he pronounced the *Calcarea* to offer one of the most luminous expositions of the evolutional theory In this single group the development in general of the canal system of the sponges is revealed from its starting-point in the simple Ascon to its almost completed stage in the Leucon, with a completeness that leaves little further to be hoped for, unless it be the requisite physiological explanation

Class *MYXOSPONGIÆ*

Order 1 **HALISARCINA**

Family 1 HALISARCIDÆ, Lfd —The flagellated chambers are syconate Examples *Halisarca*, Duj (with branched chambers), *Bajalus*, Lfd (with simple chambers)

Family 2 OSCARELLIDÆ, Lfd —The flagellated chambers are eurypylous and rhagose Example *Oscarella*, Vosm

Order 2 **CHONDROSINA**

Family 1 CHONDROSIIDÆ —With the characters of the order Example *Chondrosia*, O S

Class *SILICISPONGIÆ*

Sub class I HEXACTINELLIDA

Order 1 †LYSSACINA

Family 1 EUPLECTELLIDÆ —The spicules of the dermal membrane are "daggers" (fig 15 *a*) Examples *Euplectella*, Owen, *Holascus*, E Sch , *Habrodictyum*, W T

Family 2 ASCONEMATIDÆ —The dermal spicules are "pinnuli" (fig 15 *b*, *c*) Examples *Asconema*, S Kent , *Sympagella*, O S , *Caulophacus*, Schulze

Family 3 HYALONEMATIDÆ —The dermal spicules are pinnuli and amphidisks (fig 15 *d*) Example *Hyalonema*, Gray

Family 4 †ROSSELIDÆ —The dermal spicules are somphi, stauri (fig 15 *f*), and oxeas Examples *Rossella*, Crtr , *Crateromorpha*, Gray , *Aulochona*, E Sch

Family 5 *RECEPTACULIDÆ, Hinde —The distal ray of the dermal spicules is expanded horizontally into a polygonal plate. Example *Receptaculites*, Defr

Order 2 †DICTYONINA

Sub-order 1 *UNCINITARIA*

Uncinate spicules are present

Tribe *a* CLAVULARIA.

Clavulæ (fig 16 *c*) are present

Family 1 FARREIDÆ —Characters those of the tribe Example *Farrea*, Bwk

Tribe *b* SCOPULARIA

The dermal spicules are scopulariæ (fig 16 *b*)

Family 1 †EURETIDÆ —Branched anastomosing tubes, or goblet-shaped, with lateral outlets Examples *Eurete*, Marshall , *Periphragella*, Marshall , *Lefroyella*, Schulze.

Family 2 †MELLITTONIDÆ —Tubular or goblet-shaped, with honeycomb like walls Example *Aphrocallistes*, Gray

[1] An * indicates that the group is only known in the fossil state, a † that it is both recent and fossil.

Family 3 †CHONDLASMATIDÆ.—Flat or beaker-shaped, straight funnel-shaped canals perforating the wall perpendicularly and opening laterally on each side Example *Chondlasma*, Schulze

Family 4 †VOLVULINIDÆ.—Tubular, goblet-shaped, or massive, crooked canals more or less irregular in their course Examples *Volvulina*, Schulze, *Fieldingia*, S Kent

Family 5 SCLEROTHAMNIDÆ.—Arborescent body, perforated at the ends and sides by round narrow radiating canals Example *Sclerothamnus*, Marshall

Sub order 2 *INERMIA*.

Dictyonina without uncinati, clavulæ, or scopulariæ

Family 1 †MYLIUSIDÆ.—Depressed cup-shaped, a complex folding of the wall produces lateral excurrent tubes Example *Myliusia*, Gray

Family 2 †DACTYLOCALYCIDÆ.—Goblet-shaped or pateriform, with a thick wall consisting of numerous parallel anastomosing tubes, of uniform breadth, which terminate at the same level within and without Examples *Dactylocalyx*, Gray, *Scleroplegma*, O S, *Margaritella*, O S

Family 3 †EURYPLEGMATIDÆ.—Goblet-shaped or resembling ear shaped saucers, the wall deeply folded longitudinally so as to produce a number of dichotomously branched canals or covered-in grooves Example *Euryplegma*, Schulze

Family 4 †AULOCYSTIDÆ.—Of massive rounded form, with an axial cavity, wall consisting of a system of obscurely radiating anastomosing tubes and intervening inter-canals, both inter-canals and the external terminations of the tubes are covered by a thin membrane, which is perforated by slit-like openings over the lumina of the tubes, and thus assumes a sieve-like character Examples *Aulocystis*, Schulze, *Cystispongia*, Roemer

This arrangement of the *Hexactinellida* is taken from the latest work on the subject, Schulze's *Preliminary Report on the "Challenger" Hexactinellida* The reference of fossil forms to the families here instituted is rendered difficult by the disappearance of the requisite "guiding" spicules in the process of mineralization A revision of the fossil families to bring them into harmony with the recent has certainly been rendered necessary, but this is too large a task to undertake in this place

Sub-class II DEMOSPONGIÆ.

Tribe *a*, MONAXONIDA

Order 1 **MONAXONA**

Family 1 TETHYIDÆ.—Skeleton consisting of radiately arranged strongyloxeas (except in the genus *Chondrilla*, which is without megascleres) and large spherasters The ectosome is a thick fibrous cortex Example *Tethya*, Lmk, *Chondrilla*, O S

Family 2 POLYMASTIDÆ.—Skeleton consisting of styles radiately arranged and cortical tylostyles The oscules in many cases open at the ends of long papillæ Examples *Polymastia*, Bwk, *Thecaphora*, O S, *Trichostemma*, Sars

Family 3 SUBERITIDÆ.—Skeleton consisting of strongylate or tylotate styles, arranged to form a felt The flesh spicules when present are usually microrabds or spirasters Examples *Suberites*, Nardo, *Cliona*, Grant, *Poterion*, Schlegel

Family 4 DESMACIDONIDÆ.—The flesh spicules are cymbas Examples *Esperella*, Vosm, *Desmacidon*, Bwk, *Cladorhiza*, Sars

Family 5 †HALICHONDRIDÆ.—The flesh spicules when present are never cymbas Examples *Halichondria*, Fl, *Reniera*, O S, *Chalina*, Bwk, **Pharetrospongia*, Soll

Family 6 ECTYONIDÆ.—The skeleton consists of fibres echinated by projecting spicules Examples *Plocamia*, O S, *Ectyon*, Gray, *Clathria*, O S

Family 7 †SPONGILLIDÆ.—*Halichondridæ* which are reproduced both sexually and by statoblasts Habitat freshwater Examples *Spongilla*, Lmk, *Ephydatia*, Lmk, *Parmula*, Crtr, *Potamolepis*, Marshall [1]

The foregoing classification is purely provisional, the group requires a complete revision

Order 2 **CERATOSA**

Family 1 DARWINELLIDÆ.—Canal system of the eurypylous Rhagon type Flagellated chambers, pouch-shaped, large, the surrounding collenchyme not granular Horny fibres with a thick core Examples *Darwinella*, Fritz Muller, *Aplysilla*, F E S, *Ianthella*, Gray

Family 2 SPONGELIDÆ.—Canal system as in the *Darwinellidæ*, but the flagellated chambers more or less spherical Horny fibres with a thin core, and usually containing foreign enclosures Examples *Velinea*, Vosm, *Spongelia*, Nardo, *Psammoclema*, Marshall, *Psammopemma*, Marshall

Family 3 SPONGIDÆ.—Canal system aphodal Chambers small and spherical, surrounding collenchyme granular Fibres with a thin core Examples *Euspongia*, Bronn, *Coscinoderma*, Crtr, *Phyllospongia*, Ehlers

[1] Freshwater sponges without statoblasts are excluded from this family, and left for distribution amongst allied marine genera

Family 4 APLYSINIDÆ.—Canal system diplodal, collenchyme surrounding the flagellated chambers densely granular Fibres with a thick core Examples *Luffaria*, Duch and Mich, *Verongia*, Bwk, *Aplysina*, Nardo

The species of sponge in common use are three,—*Euspongia officinalis* (Linn), the fine Turkey or Levant sponge, *E zimocca* (O S), the hard Zimocca sponge, and *Hippospongia equina* (O S), the horse sponge or common bath sponge The genus *Euspongia* is distinguished by the regular development of the skeletal network throughout the body, its narrow meshes, scarcely or not at all visible to the naked eye, and the regular radiate arrangement of its chief fibres *Hippospongia* is distinguished by the thinness of its fibres and the labyrinthic character of the choanosome beneath the skin As a consequence its chief fibres have no regular radiate arrangement The species of *Euspongia* are distinguished as follows In *E officinalis* the chief fibres are of different thicknesses, irregularly swollen at intervals, without exception cored by sand grains, in *E zimocca* they are thinner, more regular, and almost free from sand In *E officinalis*, again, the uniting fibres are soft, thin, and elastic, whilst in *E zimocca* they are denser and thicker, to which difference the latter sponge owes its characteristic hardness Finally, the skeleton of *E officinalis* is of a lighter colour than that of *E zimocca* The common bath sponge (*Hippospongia equina*) has almost always a thick cake-like form, but its specific characters are not yet further defined

Tribe *b* TETRACTINELLIDA

Order 1 **CHORISTIDA**

Sub-order 1 *SIGMATOPHORA*

The microsclere is a sigmaspire

Family 1 TETILLIDÆ.—The characteristic megasclere is a protriæne Canal system in the lower forms eurypylous, in the higher aphodal The ectosome in the simpler forms is a dermal membrane, in the higher a highly differentiated cortex Examples *Tetilla*, O S, *Craniella*, O S (fig 21 *h*, *l*)

Family 2 SAMIDÆ.—The characteristic megasclere is an amphitriæne Example *Samus*, Gray

Sub-order 2 *ASTEROPHORA*

The microsclere is an aster

Group 1 SPIRASTROSA.—A spiraster is usually present

Family 1 THENEIDÆ, Carter.—The flesh spicule is a spiraster Canal system eurypylous Ectosome not differentiated to form a cortex Examples *Thenea*, Gray (fig 21 *a*, *f*), *Pœcillastra* (*Normania*), Bwk

Family 2 †PACHASTRELLIDÆ.—Canal system eurypylous in the lower, aphodal in the higher forms Examples *Plakortis*, F E S, *Dercitus*, Gray

Group 2 EUASTROSA.—Spirasters are absent

Family 1 †STELLETTIDÆ.—Canal system aphodal, but approaching the eurypylous in the lower forms The cortex chiefly consists of collenchyme in the lower forms, in the higher it is highly differentiated Example *Stelletta*, O S (fig 11), *Ancorina*, O S, *Myriastra*, Soll

Family 2 TETHYIDÆ.—Although this family has been placed in the *Monaxonida*, this seems to be its more natural position

Group 3 STERRASTROSA.—A sterraster is present, usually in addition to a simple aster

Family 1 †GEODINIDÆ.—The megascleres are partly triænes Canal system always aphodal Cortex highly differentiated Examples *Geodia*, Lmk (fig 21 *n*), *Pachymatisma*, Bwk (fig 21 *c*), *Cydonium*, Muller (fig 10), *Erylus*, Gray

Family 2 PLACOSPONGIDÆ.—The megasclere is a tylostyle Triænes are absent Example *Placospongia*, Gray

Sub-order 3 *MICROSCLEROPHORA*

Microscleres only are present

Family 1 PLAKINIDÆ, Schulze.—Canal system very simple, belonging to eurypylous Rhagon type Characteristic spicules candelabra Examples *Plakina*, F.E S (fig 26)

Family 2 CORTICIDÆ.—Canal system aphodal or diplodal Mesoderm a collenchyme crowded with oval granular cells, the spicules either candelabra, amphitriænes, or triænes irregularly dispersed in it Example *Corticium*, O S (figs 9, 21 *b*)

Family 3 THROMBIDÆ.—Canal system diplodal Spicules trichotriænes Example *Thrombus*, Soll

The *Pachastrellidæ* or the *Corticidæ* are probably the families from which the Tetracladine Lithistids have been derived In the *Tetillidæ* the characteristic microsclere may occasionally fail, but there is never any difficulty in identifying the sponge in this case, as the triænes are of a very characteristic form the arms of the protriænes are slender, simple, and directed very much forwards, making a very large angle with the shaft Microscleres, having the form of little globules, are sometimes present with the sigmaspires.

Order 2 **LITHISTIDA**, O S

Sub-order 1 *TETRACLADINA*, Zittel.

The desmas are modified calthrops spicules

Family 1. TETRACLADIDÆ.—With the characters of the sub-order. Examples: *Theonella*, Gray (fig. 21 *k*); *Discodermia*, Bocage; **Siphonia*, Parkinson.

Sub-order 2. *RHABDOCREPIDA.*

The desmas are of various forms, produced by the growth of silica over a uniaxial spicule.

Family 1. MEGAMORINIDÆ.—The desmas are comparatively large. Triænes, usually dichotriænes, help to support the ectosome. Microscleres usually spirasters. Examples: *Corallistes*, O.S.; **Hyalotragos*, Zittel; *Lyidium*, O.S.; **Dorydermia*, Zittel.

Family 2. MICROMORINIDÆ.—The desmas are comparatively small. Triænes and microscleres are both absent. Examples: *Azorica*, Crtr.; **Verruclina*, Zittel.

Sub-order 3. *ANOMOCLADINA.*

Desmas with a massive nucleated centrum, from which a variable number of arms (*28*) extend radiately (see fig. 12 *f*). Examples: *Vetulina*, O.S.; **Astylospongia*, Roemer.

Reproduction and Embryology.

Fresh individuals arise by asexual gemmation, both external and internal, by fission, and by true sexual reproduction.

Asexual multiplication.

Fission is probably one of the processes by which compound sponges are produced from simple individuals. Artificial fission has been practised with success in the cultivation of commercial sponges for the market. External gemmation has been observed in *Thenea*, *Tethya*, *Polymastia*, and *Oscarella*. A mass of indifferent sponge-cells accumulates at some point beneath the skin, bulges out, drops off, and gives rise to a new individual. Internal gemmation, which results in the formation of a statoblast, is only known to occur in the freshwater *Spongillidæ*. The statoblasts consist of a mass of yolk-bearing mesoderm cells, invested by a capsule, which in *Ephydatia fluviatilis* is composed of an inner cuticle of spongin separated from a similar outer layer by an intermediate zone of amphidisks and interspersed protoplasmic cells. On one side of the capsule is a hilum which leads into the interior.

Their development has recently been studied by Götte, with results that confirm the conclusions of Carter (*3*) and Lieberkühn (*13*). The process commences with an accumulation of amœboid cells within the mesoderm to form a globular cluster; yolk granules develop within them, especially in those that lie nearer the centre. The external cells give rise to the investing capsule; some resemble sponginblasts and secrete the inner and outer horny cuticle; others give rise to the amphidisks and interspersed cells of the middle layer. Under favourable conditions the interior cells creep out through the pore of the capsule, and form a spreading heap, which by subsequent differentiation gives rise to a young *Spongilla*. Since the freshwater sponges can only be regarded as modified descendants of ancient marine species (probably of the family *Halichondridæ*), we may consider the internal gemmules, like the similar statoblasts of the freshwater *Polyzoa*, as special adaptations to a changed mode of life. They appear primarily to serve a protective purpose, ensuring the persistence of the race, since they only appear in extreme climates on the approach of drought, and in cold ones on the approach of winter. As a secondary function they serve for the dispersal of the species; some are light enough to float down a stream, but not too far, so that there is no danger of their being carried to sea; others, which are characterized by large air-chambers, are possibly distributed by the wind.

Sexual reproduction.

Both sexual elements may be formed in the same individual, *e.g.*, *Oscarella lobularis*, *Grantia raphanus*, and many others; but even in hermaphrodites one or other element usually occurs to excess in different individuals, so that some are predominantly male and others predominantly female. Polejaeff found only one such male form to 100 female forms in *Grantia raphanus*. In other sponges—*Reniera fertilis*, *Euspongia officinalis*—the sexes are distinct. The ova develop from archæocytes or wandering amœboid cells, which increase in size and acquire a store of reserve nourishment in the form of yolk granules; at first they exhibit lively amœboid movements, but later pass into a resting stage. The cavity of the mesoderm within which they are situated becomes lined

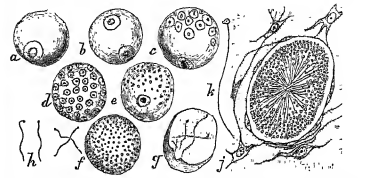

FIG. 24.—Spermatozoa. *a-h*, Development of spermatozoa in *Sycandra raphanus*, highly magnified; *h*, mature spermatozoa. After Polejaeff (×792). *j*, A sperm ball in *Oscarella lobularis* (×500); *k*, an isolated mature spermatozoon. After Schulze (×800).

by a layer of epithelium, which may not appear, however, till a late stage of segmentation. In *Euspongia officinalis* the ova occur congregated in groups within the mesoderm, thus presenting an early form of ovary. The spermatozoa, which also develop from wandering amœboid cells, are minute bodies with an oval or pear-shaped head and a long vibratile tail (fig. 24 *k*). Each amœboid cell produces a large number of spermatozoa, which occur in spherical clusters or sperm-balls. The heads of the spermatozoa, as in the *Metazoa*, are produced from the nucleus of the mother-cell, the tails from the surrounding protoplasm.

The development in detail is upon two plans. In *Grantia raphanus* (*15*) the nucleus of the mother-cell divides into two (fig. 24 *b*); one of the resulting daughter nuclei undergoes no further change, but with a small quantity of peripheral protoplasm forms a "cover-cell" to the other or primitive sperm nucleus and its associated protoplasm. The sperm nucleus repeatedly divides, with-

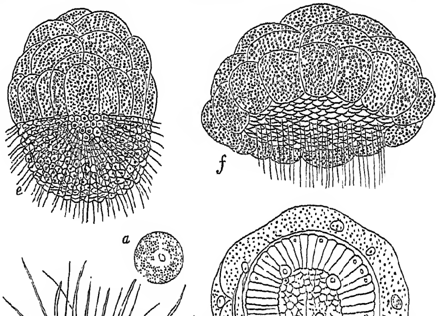

FIG. 25.—Development of a calcareous sponge (*Sycandra raphanus*). *a*, ovum; *b*, *c*, ovum segmented,—*b*, as seen from above, *c*, lateral view; *d*, blastosphere; *e*, amphiblastula; *f*, commencement of the invagination of the flagellated cells of the amphiblastula; *g*, gastrula attached by its oval face; *h*, *j*, young sponge (Ascon stage),—*h*, lateral view, *j*, as seen from above. After Schulze.

out involving the surrounding protoplasm (fig 24 *c f*) The resulting nuclei at length cease to exhibit a nucleolus, and become directly transformed into the heads of spermatozoa, the tails are appropriated by each head from the common protoplasmic residue The mother-cell in this case undergoes no increase in volume as development proceeds, and it is not enclosed within an "endothelial" layer In the second and apparently more usual case (*20*) no "cover-cell" is formed, but the mother cell divides and subdivides, protoplasm as well as nuclei, till a vast number of minute cells results, the nucleus of each becomes the head of a spermatozoon and the protoplasm its tail In this case the sperm-ball does increase in bulk it grows as it develops, and the cavity containing it becomes lined by epithelium, or so-called "endothelium" (fig 24 *g*) No doubt (*15*) the development of the epithelium stands in direct physiological connexion with the growth of the sperm-ball

Embryology

Obscure as are the details of this subject, sufficient is known to enable us to make out two chief types of development One, common amongst the calcareous sponges, and possibly occurring in a single genus (*Gummina*) of the *Micromastictora*, is characterized by what is known as the "amphiblastula" stage, the other, widely spread amongst the *Micromastictora* (*Reniera*, *Desmacidon*, *Euspongia*, *Spongelia*, *Aplysilla*, *Oscarella*), is characterized by a "planula" stage

The first has been most thoroughly investigated in *Grantia raphanus* by Schulze (*20*) The ovum by repeated segmentation gives rise to a hollow vesicle, the wall of which is formed by a single layer of cells—*blastosphere* (fig 25 *d*) Eight cells at one pole of the blastosphere now become differentiated from the rest, they remain rounded in form, comparatively large, and become filled with granules (stored nutriment), while the others, rapidly multiplying by division, become small, clear, columnar, and flagellated By further change the embryo becomes egg-shaped, the granular cells, now increased in number to thirty-two, form the broader end, and the numerous small flagellated cells the smaller end. Of the granular cells sixteen are arranged in an equatorial girdle adjoining the flagellate cells A blastosphere thus differentiated into two halves composed of different cells is known as an *amphiblastula* The amphiblastula (fig 25 *c*) now perforates the maternal tissue, and is borne along an excurrent canal to the oscule, where it is discharged to the exterior and swims about in a whirling lively dance It then assumes a more spherical form, a change premonitory of the next most remarkable phase of its career In this the flagellated layer becomes flattened, depressed, and finally invaginated within the hemisphere of granular cells, to the inner face of which it applies itself, thus entirely obliterating the cleavage cavity, but by the same process originating another (the invagination cavity) at its expense (fig 25 *f*) The two-layered sac thus produced is a *paragastrula*, its outer layer, known as the *epiblast*, gives rise to the ectoderm, the inner layer or hypoblast to the endoderm The paragastrula next becomes somewhat beehive-shaped, and the mouth of the paragastric cavity is diminished in size by an ingrowth of the granular cells around its margin The larva now settles mouth downwards on some fixed object, and exchanges a free for a fixed and stationary existence (fig 25 *g*) The granular cells completely obliterate the original mouth, and grow along their outer edge over the surface of attachment in irregular pseudopodial processes, which secure the young sponge firmly to its seat (fig 25 *h*) The granular cells now become almost transparent, owing to the exhaustion of the yolk granules, and allow the hypoblast within to be readily seen, a layer of jelly-like material, the rudimentary mesoderm, is also to be discerned between the two layers The spicules then become visible, slender oxeas appear first, and afterwards tri- and quadri radiate spicules The larva now elongates into a somewhat cylindrical form, the distal end flattens, and an oscule opens in its midst Pores open in the walls, the endodermal cells, which had temporarily lost their flagella, reacquire them, at the same time extending the characteristic collar In this stage (fig 25 *h*, *g*) the young sponge corresponds to a true Ascon, no trace of radial tubes being visible, but as they characterize the parent sponge they must arise later, and thus we have clear evidence through ontogeny of the development of a Sycon sponge from an Ascon

The three most striking features in the history of this larva are, first, the amphiblastula stage, next the invagination of the flagellate cells within the granular, instead of invagination in the reverse order, and third the attachment of the larva by the oral instead of the aboral surface Should Schulze be correct in deriving the sponges from the *Cœlentera*, it is probable that the reversal of the Cœlenterate history as exemplified in the last two events will furnish an explanation of the remarkable divergencies which distinguish the two phyla The history of the second or planula type has been thoroughly worked out by Schulze (*20*) in a little incrusting Tetractinellid sponge (*Plakina monolopha*, Schulze) The ovum by regular segmentation produces a blastosphere, the blastomeres of which

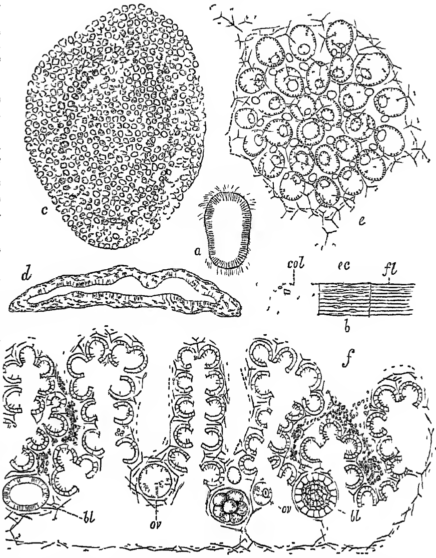

FIG 26 —Development of a *Demospongia* (*Plakina monolopha*) *a*, planula (the central part should be shaded) *b*, Section through side of planula, *ec*, flagellated cells, *fl*, their flagella, *col*, cœnoblast *c*, Attached gastrula (the paragaster is formed by fission) *d*, Section across the foregoing *e*, Young sponge (Rhagon) *f*, Part of a section through fully grown sponge, the attached basal layer is the hypomere, the spongomere is folded so as to produce incurrent and excurrent canals, the canal system is eurypylous, *ov*, ova (a segmented ovum lies between two of them), *bl*, blastospheres After Schulze

increase in number by further subdivision till they become converted into hyaline cylindrical flagellated cells (fig 26 *f*) Thus a blastosphere is produced consisting wholly of similar flagellated cells It becomes egg-shaped, and, hitherto colourless, assumes a rose red tint, which is deepest over the smaller end The larva (now a planula, fig 26 *a*, by the filling in of the central cavity) escapes from the parent and swims about broad end foremost In this stage thin sections show that the cleavage cavity is obliterated, its place being occupied by a mass of granular gelatinous material containing nuclei (fig 26 *b*) In from one to three days after hatching the larva becomes attached It then spreads out into a convex mass, and a cavity is produced within it by the splitting of the central jelly (fig 26 *c*, *d*, compare *Eucope* and others amongst the Cœlenterates) This cavity becomes lined by short cylindrical cells (endoderm), while the flagellated cells of the exterior lose their flagella and become converted into pinnacocytes (ectoderm) The gelatinous material left between the two layers now formed acquires the characters of true collenchyme and thus becomes the mesoderm The endoderm then sends off into the mesoderm, as buds, rounded chambers, which communicate with the paragastric cavity by a wide mouth and with the exterior by small pores (fig 26 *e*) An oscule is formed later, and the sponge enters upon the Rhagon phase Subsequent foldings of the sponge-wall give rise to a very simple canal system (fig 26 *f*) In addition to these two well ascertained modes of development others have been described which at present appear aberrant In *Oscarella lobularis*, O S (*27*), a curious series of early developmental changes results in the formation of an irregular paragastrula, the walls of which become folded (while still within the parent sponge) in a complex fashion, so as to produce a form in which the incurrent and excurrent canals appear to be already sketched out before the flagellated chambers are differentiated off In *Spongilla* Gotte describes the ectoderm as becoming entirely lost on the attachment of the larva, so that the future sponge proceeds from the endoderm alone As *Spongilla*, however,

is a freshwater form, anomalies in its development (which remind us of those in the development of the freshwater *Hydra*) might almost be expected.

Homoplasy. Probably in no other single group is the doctrine of homoplasy enunciated by Lankester more tellingly illustrated than in the sponges. The independent development of similar types of canal system in different groups, sometimes within the limits of a single family, is a remarkable fact. In the following table the sign × shows independent evolution of similar types of canal system in different groups:—

	Ascon	Sycon	Rhagon: Eurypylous	Rhagon: Aphodal	Rhagon: Diplodal
Class *Calcarea*	×	×	×		
Order *Halisarcina*		×	×		
Order *Monaxonida*			×	×	
Order *Ceratosa*		×	×	×	×
Sub-order *Microsclerophora*			×	×	×
Order *Choristida*			×	×	
Family *Tetillidæ*			×	×	

In the gross anatomy of the canal system similar homoplasy obtains; thus, to cite one case amongst many, a peculiar type of canal system characteristic of *Siphonia* (Lithistid) occurs also in *Emplocia* (Hexactinellid), *Schmidtia* (Monaxonid), and other apparently unrelated genera. The development of a cortex has likewise taken place independently, but on parallel lines, in the *Syconidæ*, *Leuconidæ*, *Monaxona*, *Tetillidæ*, and *Stellettidæ*. Calcareous and siliceous spicules have evidently an independent history, and yet all the chief forms of the former are repeated in the latter. Quite as remarkable is the similarity of the independently evolved horny spicules of *Darwinella aurea* to the quadri- and sex-radiate siliceous spicules. We have now sufficient knowledge of the morphology and evolution of the sponge to furnish the physicist with data for an explanation of the skeleton, at least in its main outlines. The obvious conclusion from this is that variation does not depend upon accident, but on the operation of physical laws as mechanical in their action here as in the mineral world. Another important consequence follows: if homoplasy—*i.e.*, the independent evolution of similar structures—is of such certain and quite common occurrence in the case of the sponges, it is also to be looked for in other groups, and polyphyletic origin, so far from being improbable, is as likely an occurrence as monophyletic origin.

Physiology and Ætiology

Physiology. Under the head of "physiology" we have almost a blank. At present we do not even know what cells of the sponge are primarily concerned in the ingestion of food. If a living sponge, such as *Spongilla*, be fed with carmine for a few minutes, then immersed in dilute osmic acid, and examined in thin sections, its flagellated chambers are found to be all marked out as red circular patches, and a closer investigation shows that the choanocytes, and they alone, have ingested the carmine. In this way we confirm the earlier observations of Carter made by teasing carmine-fed sponges. This might be thought to decide the question; but, though it effectually disposes of Polejaeff's argument that the choanocytes do not ingest nutriment because mechanical disadvantages (conceived *a priori*) make it impossible, it has not proved a final solution. Von Lendenfeld, by feeding sponges such as *Aplysilla* with carmine for a longer interval—a quarter of an hour—finds that amœboid cells crowd about the sides and particularly the floor of the subdermal cavities, and are soon loaded with carmine granules; after a time they wander away to the flagellated chambers and there cast out into the excurrent canals the carmine they have absorbed, apparently in an altered state. On the other hand, the choanocytes, though they at first absorb the carmine, soon thrust it out, apparently in an unaltered state. Hence Von Lendenfeld concludes that it is the epithelium of the subdermal cavities which is charged with the function of ingestion, and that the amœboid cells subsequently digest and distribute it, and finally cast out the worthless residues. There may be much truth in this view, but it requires to be supported by further evidence. (1) Sufficient proof is not adduced to show that the carmine granules expelled from the amœboid cells are really more decomposed than those rejected by the choanocytes. (2) There is at present no proof that carmine is a food, or that if it is sponges will readily feed upon it. In either case one would expect the amœboid cells to play the part which they perform in other organisms and to remove as soon as possible useless or irritant matter from the surface which it encumbers; at the same time the choanocytes, not having found the food to their liking, would naturally eject it. (3) If the choanocytes do not ingest food, how does the Ascon feed, since in this sponge all the pinnacocytes are external? It is, however, a very noticeable fact that, as the organization of a sponge increases in complexity, the choanocytal layers become reduced in volume relative to the whole bulk of the individual; and it is quite possible that as histological differentiation proceeds it may be accompanied by physiological differentiation which relieves the choanocytes to some extent of the ingestive part of their labours.

Ætiology. The origin of the sponges is to be sought for among the choanoflagellate *Infusoria*; and Savile Kent has described a colonial form of this group which is suggestively similar to a sponge. Its differences, however, are as marked as its resemblances, and have been sufficiently pointed out by Schulze (*23*). Kent has called this form *Protospongia*, a name already made use of, and fortunately, as the organism is not in any sense a true sponge, the present writer proposes, therefore, to call it *Savillia*, in honour of its discoverer. It consists of choanoflagellate *Infusoria* (see PROTOZOA, vol. xix. p. 858, fig. XXI. 15), half projecting from and half embedded in a structureless jelly or blastema, within which other cells of an amœboid character and reproductive function are immersed. Professor Haddon arrives at the generalization that conjugation amongst the *Protozoa* always takes place between individuals of the same order: flagellate cells conjugate with flagellate, amœboid with amœboid, but never with flagellate; while in true sexual reproduction the conjugation occurs between two individual cells in different stages of their life cycle: a flagellate cell conjugates with a resting amœboid cell. Now *Savillia* would appear to be extremely near such a true sexual process, since the simultaneous coexistence of cells in two different stages of life and within easy reach of each other—a necessary preliminary, one would think, to the union—has already been brought about. That coalescence between two different histological elements should result in products similarly histologically differentiated (compare amphiblastula stage of *Calcarea*) has in it a certain fitness, which, however, has still to be explained. The mode by which an organism like *Savillia* might become transformed into an Ascon cannot be suggestively outlined with any satisfactory results till our knowledge of the embryology of sponges is more advanced. The minute characters of the flagellate cells of the amphiblastula and other sponge larvæ are still a subject for research. They often possess a neck or collum; but the existence of a frill or collar is disputed. Kent asserts that it is present in several embryos which he figures; and Barrois makes the same assertion in respect to the larva of *Oscarella*, and illustrates his description with a figure. On the other hand, Schulze and Marshall both

deny its existence, and the former attributes Kent's observations to error. One constant character they do possess: they are provided with flagella at some stage of their existence, but never with cilia. Ciliated cells, indeed, are unknown amongst the sponges, and, when pinnacocytes exceptionally acquire vibratile filaments, as in *Oscarella* and other sponges, these are invariably flagella, never cilia. An Ascon stage having been reached at some point in the history of the sponges, the Sycon tubes and Rhagon chambers would arise from it by the active proliferation of choanocytes about regularly distributed centres, possibly as a result of generous feeding. Vosmaer recognized as the physiological cause of Sycon an extension of the choanocytal layer. Polejaeff, relying on Von Lendenfeld's experiments, which seem to prove that it is the pinnacocytes and not the choanocytes which are concerned in the ingestion of nutriment, argues that, as in Sycon the pinnacocytal layer is increased relatively to the choanocytal, we have in this a true explanation of the transition. The existence of *Homoderma*, Lfd., however, shows that in the first stage there was not a replacement of choanocytes by pinnacocytes, but that this was a secondary change, following the development of radial tubes, and therefore cannot be relied upon to explain them. The radial tubes having been formed by a proliferation of choanocytal cells, the reduction of those lining the paragastric cavity to pinnacocytes would follow in consequence of the poisonous character of the water delivered from the radial tubes to the central cavity, since this water not only parts with its dissolved oxygen to the choanocytes it first encounters, but receives from them in exchange urea, carbonic acid, and fæcal residues. The development of subdermal cavities is explicable on Von Lendenfeld's hypothesis.

Distribution.

Distribution in space; Our knowledge of this subject is at present but fragmentary; we await fuller information in the remaining reports on the sponges obtained by the "Challenger." The sponges are widely distributed through existing seas, and freshwater forms are found in the rivers and lakes of all continents except Australia, and in numerous islands, including New Zealand. Many genera and several species are cosmopolitan, and so are most orders.

As instances of the same species occurring in widely remote localities we take the following from Polejaeff:—*Sycon arcticum* is found at the Bermudas and in the Philippine Islands, as also are *Leuconia multiformis* and *Leucilla uter*; *Sycon raphanus* occurs at Tristan da Cunha and the Philippines; *Heteropegma nodus gordii* and *Leuconia dura* at the Bermudas and Torres Straits. We do not know, however, whether these species are isolated in their distribution or connected by intermediate localities. Of the *Calcarea* about eighty-one species have been obtained from the Atlantic, twenty-two from the Pacific, and twenty two from the Indian Ocean; but these numbers no doubt depend largely on the extent to which the several oceans have been investigated, for the largest number of species has been found in the ocean nearest home. Schulze states that the *Hexactinellida* brought home by the "Challenger" were obtained at seventeen Atlantic stations, twenty seven Pacific, and nineteen in the South Seas. In the last the number of species was greatest, in the Atlantic least. They flourish best on a bottom of diatomaceous mud. The *Calcarea* and *Ceratosa* are most abundant in shallow water and down to 40 fathoms, but they descend to from 400 to 450 fathoms. The *Hexactinellida* are most numerous over continental depths, *i.e.*, 100 to 200 fathoms, but they extend downwards to over 2500 fathoms and upwards into shallow water (10 to 20 fathoms). The *Lithistida* are not such deep water forms as the *Hexactinellida*, being most numerous from 10 to 150 fathoms. Only one or two species have been dredged from depths greater than 400 fathoms, and none from 1000 fathoms. The *Choristida* range from shallow water to abyssal depths. A characteristic deep-sea Choristid genus is *Thenea*, Gray (= *Wyvillc Thompsonia*, Wright; *Dorvillia*, Kent). This is most frequently dredged from depths of from 1000 to 2000 fathoms; but it extends to 2700 fathoms on the one hand and to 100 on the other.

in time. Until about 1876 one of the chief obstacles to the interpretation of fossil sponges arose from a singular mineral replacement which most of them have undergone, leading to the substitution of calcite for the silica of which their skeletons were originally composed. This change was demonstrated by Zittel (*35*) and Sollas (*24*), and, though it was at first pronounced impossible, owing to objections founded on the chemical nature of silica, it has since become generally recognized. These observers also showed that the fossil sponges do not belong to extinct types, but are assignable to existing orders. Zittel in addition subjected large collections to a careful analysis and marshalled them into order with remarkable success. Since then several palæontologists have worked at the subject,—Počta, Dunikowski, and Hinde (*7*), who has published a *Catalogue*—which is much more than a catalogue—of the sponges preserved in the British Museum. The result of their labours is in general terms as follows. Fossil sponges are chiefly such as from the coarseness or consistency of their skeletons would be capable of preservation in a mineralized state. Thus the majority are *Hexactinellida*, chiefly *Dictyonina*; *Tetractinellida*, chiefly *Lithistida*; and *Calcarea*, chiefly *Leuconaria*. Monaxonid sponges rarely occur; the most ancient is *Climacospongia*, Hinde, found in Silurian rocks. A very common Halichondroid sponge of this group (*Pharetrospongia strahani*, Soll.) occurs in the Cambridge greensand; it owes its preservation to the collection of its small oxeate spicules into dense fibres. The *Choristida*, though not so common as the Lithistids, are commoner than the Monaxonids, particularly in Mesozoic strata.

The distribution of fossil sponges in the stratified systems may be summarized as follows. CALCAREA.—*Homocœla*, none. *Heterocœla*, a Syconid, in the Jurassic system. Numerous *Leuconaria* from the Devonian upwards. MYXOSPONGIÆ.—None, not fitted for preservation. HEXACTINELLIDA.—*Lyssacina*, from the Lower Cambrian upwards. *Dictyonina*, commencing in the Silurian, most numerous in the Mesozoic group; still existing. MONAXONIDA.—*Monaxona*, from the Silurian upwards. *Ceratosa*, none; few are fitted for preservation. TETRACTINELLIDA.—*Choristida*, from the Carboniferous upwards; most numerous in the Cretaceous system. *Lithistida*, from the Silurian upwards; most numerous in the Mesozoic group. In ancient times the Hexactinellids and Lithistids seem not to have been so comparatively uncommon in shallow water as they are at the present day. Thus, in the Lower Jurassic strata of the south-west of England we find Dictyonine Hexactinellids, Lithistids, and Leuconarian *Calcarea* associated together in a shelly breccia and in company with littoral shells, such as *Patella* and *Trochus*. Several Palæozoic Hexactinellids actually occur in a fine-grained sandstone. Of the Chalk, which is the great mine of fossil sponges, we must speak with caution, owing to the insufficient evidence as to the depth at which it was deposited.

As shown by *Protospongia*, the phylum of the sponges was in existence in very early Cambrian times, and probably much earlier. Before the end of the Silurian period its main branches had spread themselves out, and, developing fresh shoots since then, they have extended to the present day. Of the offshoots none of higher value than families are known to have become extinct, and of these decayed branches there are very few. The existence in modern seas of the *Asconidæ*, which must surely have branched off very near the base of the stem, is another curious instance of the persistence of simple types, which would thus appear not to be so vastly worse off in the struggle for existence than their more highly organized descendants.

Bibliography.—A fairly complete list of works on sponges published before 1882 will be found in Vosmaer's article "Porifera," in Bronn's *Klassen und Ordnungen*, vol. ii. D'Arcy Thompson's *Catalogue of Papers on Protozoa and Cœlenterata*, a still more complete list, extends to 1884.

The following is a list of works, including those referred to in the preceding pages:—(*1*) C. Barrois, *Embryologie d. quelques Éponges d. l. Manche*, Paris, 1876. (*2*) Bowerbank, *A Monograph of British* Spongiadæ, vols. i.-iv., 1864-82 (vol. iv. is posthumous, edited by Dr Norman). (*3*) Carter, a series of papers in the *Ann. and Mag. Nat. Hist.*, from 1847 to the present time (1887). (*4*) J. Clark, *On the* Spongiæ ciliatæ *as* Infusoria flagellata, 1865. (*5*) Grant, *Edin. Phil. Journ.*, 1825. (*6*) Haeckel, *Monographie d. Kalkschwamme*, 1871. (*7*) Hinde, *A Catalogue of the Sponges in the British Museum*, 1883. (*8*) Id., "On the *Receptaculitidæ*," in *Quart. Journ. Geol. Soc.*, xl. 795, 1884. Commerce

When the living matter is removed from a Ceratose sponge a network of elastic horny fibres, the skeleton of the animal, remains behind This is the sponge of commerce Of such sponges the softest, finest in texture, and most valued is the Turkey or Levant sponge, *Euspongia officinalis*, Lin The other two varieties are the *Hippospongia equina*, O Schmidt, and the Zimocca sponge, *Euspongia zimocca*, O S, which is not so soft as the others (see p 423 above) All three species are found at from 2 to 100 fathoms along the whole Mediterranean coast, including its bays, gulfs, and islands, except the western half of its northern shores as far as Venice and the Balearic Isles, Corsica, Sardinia, and Sicily Bath sponges occur around the shores of the Bahamas, and less abundantly on the north coast of Cuba They are of several kinds, one not distinguishable from the fine Levant sponge, others, the "yellow" and "hardhead" varieties, resemble the Zimocca sponge, and of horse sponges there appear to be several varieties, such as the "lamb's-wool" and the "velvet" sponge (*Hippospongia gossypina* and *H meandriformis*) The fine bath sponge occurs on the shores of Australia (Torres Straits, the west coast, and Port Phillip on the south coast) A sponge eminently adapted for bathing purposes (*Coscinoderma lanuginosum*, Crtr, *Euspongia mathewsii*, Lfd), but not yet brought into the market, occurs about the South Caroline Islands, where it is actually in use, and at Port Phillip in Australia The fine bath sponge occurs in the North Pacific, South Atlantic, and Indian Oceans, so that its distribution is world-wide

Distribution

Fishing

The methods employed to get sponges from the bottom of the sea, where they grow attached to rocks, stones, and other objects, depend on the depths from which they are to be brought In comparatively shallow water they may be loosened and hooked up by a harpoon, at greater depths, down to 30 or 40 fathoms, they are dived for, and at depths of from 50 to 100 fathoms they are dredged with a net The method of harpooning was the earliest practised, and is still carried on in probably its most primitive form by the Dalmatian fishermen Small boats are used, manned by a single harpooner with a boy to steer, when, however, the expedition is to extend over night the crew is doubled The harpoon is a five-pronged fork with a long wooden handle, and if this is not long enough another harpoon is lashed on to it The Greek fishers use a large boat furnished with two or three smaller ones, from which the actual harpooning is carried on, the crew numbers seven or eight One of the chief difficulties is to see the bottom distinctly through a troubled surface The Dalmatian fishers throw a smooth stone dipped in oil a yard or so in front of the boat, the stone scatters drops of oil as it flies and so makes a smooth track for the "lookout" The Greeks use a zinc-plate cylinder about $1\frac{1}{2}$ feet long and 1 foot wide, closed at the lower end by a plate of glass, which is immersed below the surface of the sea, on looking through this the bottom may be clearly seen even in 30 fathoms This plan is also adopted in the Bahamas, where harpooning carried on after the Greek system gives employment to over 5000 men and boys

The primitive method of diving with no other apparatus than a slab of stone to serve as a sinker and a cord to communicate with the surface is still practised in the Mediterranean The diver carries a net round his neck to hold the sponges On reaching the bottom he hastily snatches up whatever sponge he sees After staying down as long as he is able—an interval which varies from two to at the most three minutes—he tugs violently at the cord and is rapidly drawn up On entering the boat from depths of 25 fathoms he quickly recovers from the effects of his plunge after a few powerful respirations, but after working at depths of 30 to 40 fathoms or more he reaches the surface in a swooning state At the beginning of the season blood usually flows from the mouth and nose after a descent, this is regarded as a symptom of good condition, should it be wanting the diver will scarcely venture a second plunge for the rest of the season The work is severe, and frequently the diver returns empty-handed to the boat Diving is usually carried on in the summer months, in winter it is too cold, at all events without a diving-dress The ordinary diver's dress with pumping apparatus is largely used by the Greeks The diving is carried on from a ship manned by eight or nine men, including one, or rarely two, divers At a depth of from 10 to 15 fathoms the diver can remain under for an hour, at greater depths up to 20 fathoms only a few minutes, the consequences of a longer stay are palsy of the lower extremities, stricture, and other complaints Dredging is chiefly carried on along the west coast of Asia Minor, principally in winter after the autumn storms have torn up the seaweeds covering the bottom The mouth of the dredge is 6 yards wide and 1 yard high, the net is made of camel-hair cords of the thickness of a finger, with meshes 4 inches square It is drawn along the bottom by a tow-line attached to the bowsprit of a sailing vessel or hauled in from the shore

Cultivation

Prompted by a suggestion made by Oscar Schmidt, that sponges might be artificially propagated from cuttings, the Italian Government supplied funds for experiments to determine the feasibility of cultivating sponges as an industrial pursuit A station was established on the island of Lesina, off the Dalmatian coast, and experiments were carried on there for six years (1867-72) under the superintendence of Von Buccich. The results were on the whole successful, but all expectations of creating a new source of income for the sponge-fishers of Dalmatia were defeated by the hostility of the fishers themselves

The details of the method of sponge-farming as practised by Von Buccich are briefly as follows The selected specimens, which should be obtained in as uninjured a state as possible, are placed on a board moistened with sea water and cut with a knife or fine saw into pieces about 1 inch square, care being taken to preserve the outer skin as intact as possible The operation is best performed in winter, as exposure to the air is then far less fatal than in summer The sponge cuttings are then trepanned and skewered on bamboo rods, the rods, each bearing three cuttings, are secured in an upright position between two parallel boards, which are then sunk to the bottom of the sea and weighted with stones In choosing a spot for the sponge-farm the mouths of rivers and proximity to submarine springs must be avoided, mud in this case, as in that of reef-building

corals, is fatal. A favourable situation is a sheltered bay with a rocky bottom overgrown with green seaweed and freshened by gentle waves and currents. So favoured, the cuttings grow to a sponge two or three times their original size in one year, and at the end of five to seven years are large enough for the market. Similar experiments with similar results have more recently been carried on in Florida. The chief drawback to successful sponge-farming would appear to be the long interval which the cultivator has to wait for his first crop.

Preparation for market.

After the sponge has been taken from the sea, it is exposed to the air till signs of decomposition set in, and then without delay either beaten with a thick stick or trodden by the feet in a stream of flowing water till the skin and other soft tissues are completely removed. If this process is postponed for only a few hours after the sponge has been exposed a whole day to the air it is almost impossible to completely purify it. After cleaning it is hung up in the air to dry, and then with others finally pressed into bales. If not completely dried before packing the sponges "heat," orange yellow spots appearing on the parts attacked. The only remedy for this is to unpack the bale and remove the affected sponges. The orange coloured spots produced by this "pest," or "cholera" as the Levant fishermen term it, must not be confounded with the brownish red colour which many sponges naturally possess, especially near their base. The sponges on reaching the wholesale houses are cut to a symmetrical shape and further cleaned. The light-coloured sponges often seen in chemists' shops have been bleached by chemical means which impair their durability. Sponges are sold by weight; sand is used as an "adulteration."

It is difficult to obtain recent statistics as to the extent of the sponge trade; the following table gives a summary of the sponges sold in Trieste, the great European sponge market, in the year 1871:—

Description of Sponge	For Export		For Home Consumption	
	Value in £	Mean price per pound	Value in £	Mean price per pound
Horse sponge	£60,000	6s	£4400	6s
Zimocca sponge	20,000	6s	550	6s
Fine Levant sponge	20,000	14s	950	14s
Fine Dalmatian sponge	2,000	8s		

(W. J. S.)

SPONSOR. The presence of some suitable sponsor or sponsors to give the answers required and undertake the vows involved would seem to be almost essential to the right administration of the sacrament of baptism, in the case of infants at least. In this aspect, however, as in many others, the early history of the development of the rite of baptism remains obscure. The Greek word for the person undertaking this function is ἀνάδοχος, to which the Latin *susceptor* is equivalent. The word "sponsor" in this ecclesiastical sense occurs for the first time, but incidentally only, and as if it were already long familiar, in Tertullian's treatise *De Baptismo* (c. 18), where, arguing that in certain circumstances baptism may conveniently be postponed, especially in the case of little children, he asks, "For why is it necessary that the sponsors likewise should be thrust into danger, who both themselves by reason of mortality may fail to fulfil their promises, and may also be disappointed by the development of an evil disposition [in those for whom they become sponsors]?" There is nothing to make it unlikely that the sponsors here alluded to may have been in many cases the actual parents, and even in the 5th century it was not felt to be inappropriate that they should be so; Augustine, indeed, in one passage appears to speak of it as a matter of course that parents should bring their children and answer for them "tanquam fidejussores" (*Epist. ad Bonif.*, 98). The comparatively early appearance, however, of such names as *compatres*, *commatres*, *propatres*, *promatres*, *patrini*, *matrinæ* is of itself sufficient evidence, not only that the sponsorial relationship had come to be regarded as a very close one, but also that it was not usually assumed by the natural parents. How very close it was held to be is shown by the Justinianian prohibition of marriage between godparents and godchildren. On the other hand, the anciently allowable practice of parents becoming sponsors for their own children seems to have lingered until the 9th century, when it was at last formally prohibited by the council of Mainz (813). For a long time there was no fixed rule as to the necessary or allowable number of sponsors, and sometimes the number actually assumed was large. By the council of Trent, however, it was decreed that one only, or at most two, these not being of the same sex, should be permitted. The rubric of the Church of England according to which "there shall be for every male child to be baptized two godfathers and one godmother, and for every female one godfather and two godmothers," is not older than 1561; in the *Catechism* the child is taught to say that he received his name from his "godfathers and godmothers." At the Reformation the Lutheran churches retained godfathers and godmothers, but the Reformed churches reverted to what they believed to be the more primitive rule, that in ordinary circumstances this function should be undertaken by a child's proper parents. All churches, it may be added, of course demand of sponsors that they be in full communion. In the Church of Rome priests, monks, and nuns are disqualified from being sponsors, either "because it might involve their entanglement in worldly affairs," or more probably because every relationship of fatherhood or motherhood is felt to be in their case inappropriate.

SPONTINI, Gasparo Luigi Pacifico (1774-1851), dramatic composer, was born at Majolati (Ancona) in Italy, 14th November 1774, and educated at the Conservatorio de' Turchini at Naples under Sala, Tritto, and Salieri. After producing some successful operas at Rome, Florence, Naples, and Palermo, he settled in 1803 at Paris. His reception in the French capital was anything but flattering. His first comic opera, *Julie*, proved a failure; his second, *La Petite Maison*, was hissed. Undaunted by these misfortunes, he abandoned the light and somewhat frivolous style of his earlier works, and in *Milton*, a one-act opera produced in 1804, achieved a real success. Spontini henceforth aimed at a very high ideal, and during the remainder of his life strove so earnestly to reach it that he frequently remodelled his passages five or six times before permitting them to be performed in public, and wearied his singers by introducing new improvements at every rehearsal. His first masterpiece was *La Vestale*, completed in 1805, but kept from the stage through the opposition of a jealous clique until 15th December 1807, when it was produced at the Académie, and at once took rank with the finest works of its class. The composer's second opera, *Ferdinand Cortez*, was received with equal enthusiasm in 1809; but his third, *Olympia*, was much less warmly welcomed in 1819.

Spontini had been appointed in 1810 director of the Italian opera; but his quarrelsome and grasping disposition led to his summary dismissal in 1812, and, though reinstated in 1814, he voluntarily resigned his post soon afterwards. He was in fact very ill fitted to act as director; yet on 28th May 1820, five months after the failure of *Olympia*, he settled in Berlin by invitation of Frederick William III., commissioned to superintend all

music performed at the Prussian court and compose two new grand operas, or three smaller ones, every three years. But he began by at once embroiling himself with the intendant, Count Bruhl. Spontini's life at Berlin may be best described as a ceaseless struggle for precedence, under circumstances which rendered its attainment impossible in the sense in which he desired it. Yet he did good work, and did it well. *Die Vestalin*, *Ferdinand Cortez*, and *Olympia*—the last two entirely remodelled—were produced with great success in 1821. A new opera *Nourmahal*, founded on Moore's *Lalla Rookh*, was performed in 1822, and another, entitled *Alcidor*, in 1825; and in 1826 Spontini began the composition of *Agnes von Hohenstaufen*, a work planned on a grander scale than any of his former efforts. The first act was performed in 1827, and the complete work in three acts graced the marriage of Prince William in 1829. Though the German critics abused it bitterly, *Agnes von Hohenstaufen* is undoubtedly Spontini's greatest work. In breadth of conception and grandeur of style it exceeds both *Die Vestalin* and *Ferdinand Cortez*, and its details are worked out with untiring conscientiousness; yet Spontini was utterly dissatisfied with it, and at once set to work upon an entire revision, which on its representation in 1837 was in many parts scarcely recognizable by those who had heard the opera in its original form.

This was his last great work. He several times began to rewrite his early opera, *Milton*, and contemplated the treatment of many new subjects, such as *Sappho*, *La Colère d'Achille*, and other classical myths, but with no definite result. He had never been popular in Berlin; and he has been accused of endeavouring to prevent the performance of *Euryanthe*, *Oberon*, *Die Hochzeit des Camacho*, *Jessonda*, *Robert the Devil*, and other works of genius, through sheer envy of the laurels won by their composers. But the critics and reviewers of the period were so closely leagued together against him that it is difficult to know what to believe. After the death of Frederick William III in 1840, Spontini's conduct became so violent and imperious that in 1842 Frederick William IV. dismissed him, with power to retain his titles and live wherever he pleased in the enjoyment of his full salary. He elected to settle once more in Paris, after a short visit to Italy; but beyond conducting occasional performances of some of his own works he made but few attempts to keep his name before the public. In 1847 he revisited Berlin and was invited by the king to conduct some performances during the winter. In 1848 he became deaf. In 1850 he retired to his birthplace, Majolati, and died there on 14th January 1851, bequeathing all he possessed to the poor of his native town.

SPOONBILL. The bird now so called was formerly known in England as the Shovelard or Shovelar, while that which used to bear the name of Spoonbill, often amplified into Spoon-billed Duck, is the SHOVELER (see vol. xxi. p. 842) of modern days,—the exchange of names having been effected, as already stated (*loc. cit.*) about 200 years ago, when the subject of the present notice—the *Platalea leucorodia* of Linnæus as well as of recent writers—was doubtless far better known than now, since it evidently was, from ancient documents, the constant concomitant of Herons, and with them the law attempted to protect it.[1] Mr Harting (*Zoologist*, 1886, pp. 81 *et seq.*) has cited a case from the "Year-Book" of 14 Hen. VIII. (1523), wherein the then bishop of London (Cuthbert Tunstall) maintained an action of trespass against the tenant of a close at Fulham for taking Herons and "Shovelars" that made their nests on the trees therein growing, and has also printed (*Zoologist*, 1877, pp. 425 *et seq.*) an old document showing that "Shovelars" bred in certain woods in west Sussex in 1570. Nearly one hundred years later (*circa* 1662) Sir Thomas Browne, in his *Account of Birds found in Norfolk* (*Works*, ed. Wilkin, iv. pp. 315, 316), stated of the "*Platea* or *Shouelard*" that it formerly "built in the Herneries at Claxton and Reedham, now at Trimley in Suffolk." This last is the latest known proof of the breeding of the species in England; but more recent evidence to that effect may be hoped for from other sources. That the Spoonbill was in the fullest sense of the word a "native" of England is thus incontestably shown; but for many years past it has only been a more or less regular visitant, though not seldom in considerable numbers, which would doubtless, if allowed, once more make their home there; but its conspicuous appearance renders it an easy mark for the greedy gunner and the contemptible collector. What may have been the case formerly is not known, except that, according to Belon, it nested in his time (1555) in the borders of Brittany and Poitou; but as regards north-western Europe it seems of late years to have bred only in Holland, and there it has been deprived by drainage of its favourite resorts, one after the other, so that it must shortly become merely a stranger, except in Spain or the basin of the Danube and other parts of south-eastern Europe.

The Spoonbill ranges over the greater part of middle and southern Asia,[2] and breeds abundantly in India, as well as on some of the islands in the Red Sea, and seems to be resident throughout Northern Africa. In Southern Africa its place is taken by an allied species with red legs, *P. cristata* or *tenuirostris*, which also goes to Madagascar. Australia has two other species, *P. regia* or *melanorhynchus*, with black bill and feet, and *P. flavipes*, in which those parts are yellow. The very beautiful and wholly different *P. ajaja* is the Roseate Spoonbill of America, and is the only one found on that continent, the tropical or juxta-tropical parts of which it inhabits. The rich pink, deepening in some parts into crimson, of nearly all its plumage, together with the yellowish green of its bare head and its lake-coloured legs, sufficiently marks this bird; but all the other species are almost wholly clothed in pure white, though the English has, when adult, a fine buff pectoral band, and the spoon-shaped expanse of its bill is yellow, contrasting with the black of the compressed and basal portion. Its legs are also black. In the breeding season, a pendent tuft of white plumes further ornaments the head of both sexes, but is longest in the male. The young of the year have the primary quills dark-coloured.

The Spoonbills form a natural group, *Plataleidæ*, allied, as before stated (IBIS, vol. xii. p. 606), to the *Ibididæ*, and somewhat more distantly to the Storks (see STORK), —all belonging to the *Pelargomorphæ* of Prof. Huxley. They breed in societies, not only of their own kind, but in company with Herons, either on trees or in reed-beds, making large nests in which are commonly laid four eggs, —white, speckled, streaked, or blotched, but never very closely, with light red. Such breeding-stations have been several times described, and among the more recent accounts of one of them are those of Messrs Sclater and W. A. Forbes (*Ibis*, 1877, p. 412), and Mr Seebohm (*Zoologist*, 1880, p. 457), while a view of another has been attempted by Schlegel (*Vog. Nederland*, taf. xvii.). The latest systematic revision of the group is by Dr Reichenow (*Journ. fur Ornithologie*, 1877, pp. 156-159), but his views have not been wholly accepted in the present article. (A. N.)

[1] Nothing shows better the futility of the old statutes for the protection of birds than the fact that in 1534 the taking of the eggs of Herons, Spoonbills (Shovelars), Cranes, Bitterns, and Bustards was visited by a heavy penalty, while there was none for destroying the parent birds in the breeding-season. All of the species just named, except the Heron, have passed away, while there is strong reason to think that some at least might have survived had the principle of the Levitical law (Deut. xxii. 6) been followed.

[2] Ornithologists have been in doubt as to the recognition of two species from Japan described by Temminck and Schlegel under the names of *P. major* and *P. minor*. Lately it has been suggested that the former is only the young of *P. leucorodia*, and the latter the young of the Australian *P. regia*.

SPORADES, the islands "scattered" (as the name, from σπείρειν, "to sow," imports) about the Greek Archipelago, are distinguished on the one hand from the Cyclades, which are grouped around Delos, and on the other from the islands attached, as it were, to the mainland of Europe and Asia The distinction is not in either case a very definite one, and hence both ancient and modern writers differ as to the list of the Sporades Details of classification are given by Bursian (*Griechenland*, ii 348 *sq*) The Doric Sporades—Melus (MELOS),[1] Pholegandrus, Sicinus, THERA, Anaphe, Astypalæa, and Cos—were by some considered a southern cluster of the Cyclades In modern times the name Sporades is more especially applied to two groups—the Northern Sporades, which lie north-east of Negropont (Eubœa), along with which they constitute a nomarchy of the kingdom of Greece, and the Southern Sporades, lying off the south-west of Asia Minor, and included in the Turkish vilayet of the "Islands of the White Sea" The Northern, which have altogether an area of 180 square miles and a population of 13,394 (1879), comprise Skiatho, Khiliodiomi or Ikos, Skopelo, Pelagonisi, Giura, Pipari, and Skiro (SCYROS), with their adjacencies The Southern are as follows —Icaria, PATMOS, Leros, Calymno, Astypalæa (Stampalia), Cos (Stanko), Nisyros, Tilos or Episcopi, Sime, Khalki, RHODES, CRETE, and a multitude of lesser isles

SPORTS, THE BOOK OF, or more properly the DECLARATION OF SPORTS, was issued by James I in 1617 on the recommendation of Thomas Morton, bishop of Chester, for use in Lancashire, where the king on his return from Scotland found a conflict on the subject of Sunday amusements between the Puritans and the gentry, many of whom were Roman Catholics Permission was given for dancing, archery, leaping, vaulting, and other harmless recreations, and of "having of May games, Whitsun ales, and morris dances, and the setting up of May-poles and other sports therewith used, so as the same may be had in due and convenient time without impediment or neglect of divine service, and that women shall have leave to carry rushes to church for the decorating of it" On the other hand, "bear and bull baiting, interludes, and (at all times in the meane sort of people by law prohibited) bowling" were not to be permitted on Sunday (Wilkins, *Concilia*, iv 483) In 1618 James transmitted orders to the clergy of the whole of England to read the declaration from the pulpit, but so strong was the opposition that he prudently withdrew his command (Wilson, in Kennet, ii 709, Fuller, *Church History*, v. 452) In 1633 Charles I. not only directed the republication of his father's declaration (Rushworth, ii 193) but insisted upon the reading of it by the clergy Many of the clergy were punished for refusing to obey the injunction With the fall of Laud all attempt to enforce it necessarily came to an end.

SPOTSWOOD, or SPOTISWOOD, JOHN (1565-1639), archbishop of St Andrews, was the son of John Spotswood, minister of Calder and "superintendent" of Lothian, and was born in 1565 He was educated at Glasgow, and succeeded his father in the parish of Calder when but eighteen years of age In 1601 he attended Ludowick, duke of Lennox, as his chaplain, in an embassy to the court of France, and returned in the duke's retinue through England In 1603 he was nominated by the king to the see of Glasgow, but his consecration (in London) did not take place until October 1610 In 1615 he was translated as successor of Gladstanes to St Andrews, and thus became primate and metropolitan of Scotland In this capacity he presided in several assemblies of the Church of Scotland At that of Perth, in 1618, over which he presided, he used his influence to obtain a reluctant assent to the Five Articles He continued in high esteem with James VI. and Charles I, who was crowned by him in 1633 at Holyrood In 1635 Spotswood was advanced to the chancellorship, but the increasing strength of the Covenanters compelled his resignation in 1638 He was deposed and excommunicated by the Glasgow assembly in that year, charges affecting his moral character were brought against him, but no attempt was made to substantiate these He died in London on 26th December 1639 and was buried in Westminster Abbey

In 1620 he published *Refutatio Libelli de Regimine Ecclesiæ Scoticanæ*—an answer to a tract of Calderwood, who replied in the *Vindiciæ* subjoined to his *Altare Damascenum* The only other writing of Spotswood published during his lifetime was the sermon he preached at the Perth assembly His most considerable work appeared posthumously—*The History of the Church and State of Scotland, beginning the year of our Lord 203 and continued to the end of the reign of James VI of ever blessed memory*, London, 1655, fol It displays considerable research and sagacity, and even when dealing with contemporary events gives a favourable impression, upon the whole, of the author's candour and truth An appendix was afterwards added by Thomas Middleton

Spotswood left two sons,—Sir John Spotswoode of Dairsie in Fife, where the archbishop erected a church and bridge, which are still extant, and Sir Robert, a lawyer of great learning, who became president of the Court of Session, and was executed in 1646 for taking part in the expedition of Montrose

SPOTTISWOODE, WILLIAM (1825-1883), mathematician and physicist, was born in London, 11th January 1825 His father, Andrew Spottiswoode, who was descended from an ancient Scottish family, represented Colchester in parliament for some years, and in 1831 became junior partner in the firm of Eyre & Spottiswoode, printers William was educated at Laleham, Eton, Harrow, and Balliol College, Oxford His bent for science showed itself while he was still a schoolboy, and indeed his removal from Eton to Harrow is said to have been occasioned by an accidental explosion which occurred whilst he was performing an experiment for his own amusement At Harrow he obtained in 1842 a Lyon scholarship, and at Oxford in 1845 a first-class in mathematics, in 1846 the junior and in 1847 the senior university mathematical scholarship In 1846 Spottiswoode left Oxford to take his father's place in the business, in which he was engaged until his death In 1847 he issued five pamphlets entitled *Meditationes Analyticæ* This was his first publication of original mathematical work, and from this time scarcely a year passed in which he did not give to the world further mathematical researches In 1856 Spottiswoode travelled in eastern Russia, and in 1860 in Croatia and Hungary, of the former expedition he has left an interesting record entitled *A Tarantasse Journey through Eastern Russia in the Autumn of 1856* (London, 1857) In 1870 he was elected president of the London Mathematical Society. In 1871 he began to turn his attention to experimental physics, his earlier researches bearing upon the polarization of light and his later work upon the electrical discharge in rarefied gases He wrote a popular treatise upon the former subject for the "Nature" series (1874) In 1878 he was elected president of the British Association, and in the same year president of the Royal Society, of which he had been a fellow since 1853 He died of fever on 27th June 1883, and was buried in Westminster Abbey

As a mathematician he occupied himself with many branches of his favourite science, more especially with higher algebra, including the theory of determinants, with the general calculus of symbols, and with the application of analysis to geometry and mechanics The following brief review of his mathematical work is quoted from the obituary notice which appeared in the *Proceedings of the Royal Society* (vol xxxviii p 34) —"The interesting series of communications on the contact of curves and surfaces which are contained in the *Philosophical Transactions* of 1862 and

[1] The names of those Sporades which are treated under separate headings are printed in small capitals

subsequent years would alone account for the high rank he obtained as a mathematician. The mastery which he had obtained over the mathematical symbols was so complete that he never shrank from the use of expressions, however complicated—nay, the more complicated they were the more he seemed to revel in them—provided they did not sin against the ruling spirit of all his work,—symmetry. To a mind imbued with the love of mathematical symmetry the study of determinants had naturally every attraction. In 1851 Mr Spottiswoode published in the form of a pamphlet an account of some elementary theorems on the subject. This having fallen out of print, permission was sought by the editor of *Crelle* to reproduce it in the pages of that journal. Mr Spottiswoode granted the request and undertook to revise his work. The subject had, however, been so extensively developed in the interim that it proved necessary not merely to revise it but entirely to re-write the work, which became a memoir of 116 pages. To this, the first elementary treatise on determinants, much of the rapid development of the subject is due. The effect of the study on Mr Spottiswoode's own methods was most pronounced; there is scarcely a page of his mathematical writings that does not bristle with determinants." The Royal Society's *Catalogue of Scientific Papers* (vols. i.-viii.) shows a list of 49 papers by Spottiswoode, to which must be added about 66 more, the titles of which have not yet been printed in that catalogue. These were published principally in the *Philosophical Transactions, Proceedings of the Royal Society, Quarterly Journal of Mathematics, Proceedings of the London Mathematical Society*, and *Crelle*, and one or two in the *Comptes Rendus* of the Paris Academy. Another list of his papers, arranged according to the several journals in which they originally appeared, with short notes upon the less familiar memoirs, is given in *Nature*, vol. xxvii. p. 599.

SPRAIN. See SURGERY, p. 682, *infra*.

SPRAT, a marine fish (*Clupea sprattus*), named "garvie" in Scotland, one of the smallest species of the genus *Clupea* or herrings, rarely exceeds 5 inches in length, and occurs in large shoals on the Atlantic coasts of Europe. It is found also in the southern hemisphere, on the coasts of Tasmania and New Zealand, where, however, it seems to be less abundant, since its presence at the antipodes has been discovered only recently, and it does not seem to be the object of a regular fishery. Sprats are very often confounded with young herrings, which they much resemble, but can always be distinguished by the following characters: they do not possess any teeth on the palate (*vomer*), like herrings; their gill-covers are smooth, without the radiating striæ which are found in the shad and the pilchard; the anal fin consists of from seventeen to twenty rays, and the lateral line of forty-seven or forty-eight scales. The ventral fins are even with the origin of the dorsal fin; and the spine consists of from forty-seven to forty-nine vertebræ. The sprat is one of the more important food-fishes on account of the immense numbers which are caught when the shoals approach the coasts. They are somewhat capricious, however, as regards the place and time of their appearance, the latter falling chiefly in the first half of winter. They are caught with the seine or with the bag-net in the tideway. Large quantities are consumed fresh, but many are pickled or smoked, and others prepared like anchovies. Frequently the captures are so large that the fish can be used as manure only.

SPREMBERG, a small town of Prussia, in the province of Brandenburg, is situated about 75 miles to the south-east of Berlin, partly on an island in the river Spree and partly on the west bank. It carries on considerable manufactures of woollen cloth, and has greatly advanced in importance and population since the beginning of the 19th century. In 1885 its population numbered 11,011. The only building of note is the château, built by a son of Elector John George about the end of the 16th century.

SPRENGEL, KURT (1766-1833), German botanist and physician, was born on 3d August 1766 at Boldekow in Pomerania. His father, a clergyman, provided him with a thorough education of wide scope, and the boy at an early age distinguished himself as a linguist, not only in Latin and Greek, but also in Arabic. He appeared as an author at the age of fourteen, publishing a small work called *Anleitung zur Botanik für Frauenzimmer* in 1780. In 1784 he commenced in the university of Halle to study theology and medicine, but soon relinquished the former. He graduated in medicine in 1787. In 1789 he was appointed an extraordinary professor of medicine in his *alma mater*, and in 1795 was promoted to an ordinary professorship. He devoted much of his time to medical work and to investigations into the history of medicine, and he published several very valuable works in this department of knowledge, and made himself well known as one of the ablest medical men in Germany. He held a foremost rank in medicine and in botany as an original investigator, and in both published works of great value, besides numerous articles in scientific journals and in the proceedings of learned societies. His accomplishments as a linguist probably, in part at least, determined him in the choice of the department to which he most fully devoted himself, and in which he stood *facile princeps*. Among the more important of his many services to the science of botany was the part he took in awakening and stimulating microscopic investigation into the anatomy of the tissues of the higher plants, though defective microscopic appliances rendered the conclusions arrived at by himself unreliable. He also made many improvements in the details of both the Linnæan and the "natural" systems of classification. His life passed quietly at Halle in the pursuit of the studies dear to him, and in the enjoyment of the honours bestowed upon him by over seventy learned societies, and also by monarchs. In 1828 the death of a son, professor of surgery at Greifswald, was felt by him very severely. He experienced several apoplectic seizures, and died in one on 15th March 1833.

Subjoined is a list of the more important of his works:—*Beiträge zur Geschichte d. Pulses*, 1787; *Galens Fieberlehre*, 1788; *Apologie des Hippokrates*, 1789; *Versuch einer pragmatischen Geschichte der Arzneikunde*, 1792-99; *Handbuch der Pathologie*, 1795-97; *Institutiones Medicæ*, 1809-16 (in 6 vols.); *Geschichte der Medizin*, completed in 1820; *Antiquitatum botanicarum specimen*, 1798; *Historia rei herbariæ*, 1807-8; *Anleitung zur Kenntniss der Gewächse*, 1802-4, and again 1817-18; *Geschichte der Botanik*, 1817-18; *Von dem Bau und der Natur der Gewächse*, 1812; *Flora Halensis*, 1806-15, and in 1832; *Species umbelliferarum minus cognitæ*, 1818; *Neue Entdeckung im ganzen Umfang der Pflanzenkunde*, 1820-22. He edited an edition of Linnæus's *Systema vegetabilium* in 1824 and of the *Genera plantarum* in 1830. His short papers are too numerous to be quoted; a list of those in botany, from 1798 onwards, will be found in the Royal Society's *Catalogue of Scientific Papers*.

SPRINGBOK. See ANTELOPE, vol. ii. p. 101.

SPRINGFIELD, a city of the United States, capital of Illinois and the county seat of Sangamon county, 185 miles south-west of Chicago and 95 north-east of St Louis, at the intersection of the main lines of the Chicago and Alton and the Wabash, St Louis, and Pacific Railways. It is situated in 39° 48′ N. lat. and 89° 33′ W. long., on a plateau 4 miles south of the Sangamon river. The State capitol (1868-1886) is constructed of Joliet marble in the form of a Greek cross, with porticos of granite; it is 385 feet long and 296 wide, and has a central dome surmounted by a lantern with a ball on the pinnacle (360 feet). It contains a general library, a law library, geological and agricultural museums, and a memorial hall of the Civil War, as well as the usual Government offices. Other buildings of note are the United States executive mansion, custom-house and post-office (1866-68), and the house formerly occupied by Lincoln. In Oak Ridge cemetery, adjacent to the city, is the Lincoln monument (1874), beneath which that president was buried. The monument, designed by Larkin G. Mead, consists of a granite obelisk, reaching a height of 98½ feet from the centre of a spacious basement (119½ feet long and 72½ wide), which contains a catacomb and a memorial hall,—the latter a museum of Lincolniana. A bronze statue of Lincoln and four groups

of figures in bronze, symbolizing the army and navy of the United States, are arranged round the foot of the obelisk The town has a public library, two hospitals, two orphanages, and various other charitable institutions Extensive deposits of bituminous coal occur in and near Springfield, which is the seat of extensive iron-rolling mills, watch factories, railway machine shops, plough works, and woollen, paper, and flour mills It is also the headquarters of six of the principal live-stock associations of the country The population was 4533 in 1850, 9820 in 1860, 17,364 in 1870, 19,743 (1328 coloured) in 1880, and in 1887 it was estimated at 25,000

Laid out in 1822, Springfield was selected as State capital in 1837, and was made a city in 1840

SPRINGFIELD, a city of the United States the county seat of Hampden county, Massachusetts, on the east bank of Connecticut river, opposite West Springfield, with which it is connected by road and railway bridges By rail it is 98 miles west by south of Boston on the route to Albany, and it forms a very important railway junction The western part of Springfield is built on low and level ground, the eastern on the ascent from the river valley The streets are wide and well shaded with elm and maple A United States arsenal (founded 1777) and armoury (1794), employing some 460 hands, is the largest in the republic The Springfield breech-loading rifle of 45 calibre has been the regulation pattern in the United States army since 1873 A pistol-factory, car-works, manufactories of cotton and silk goods, buttons, needles, envelopes, paper, watches, skates, and brass-work may be mentioned among the industrial establishments The city hall (1855), a Romanesque building with an audience-room capable of holding 2700 persons, the city free library (1871), a Gothic building of brick, which contains 56,000 volumes and a museum, the granite court-house, the Roman Catholic cathedral of St Michael, Christ Church, Episcopal, the Church of the Unity, a fine Gothic structure in brown stone, the South Congregational church, the office of the Boston and Albany Railroad, a massive granite block, and the high school are among the chief architectural features of the city Races are held in Hampden Park by the river side The population was 15,199 in 1860, 26,703 in 1870, 33,340 in 1880 (775 coloured), and 37,577 in 1885

Springfield was settled in 1636 by William Pynchon and emigrants from Roxbury,—the determination of the founder being to limit the "town" to forty or at most fifty families The name was at first Agawam, but the present designation was adopted in 1641 in memory of Springfield (Essex), Pynchon's residence in his native country, England, to which he was obliged to return in 1652 to escape the clerical persecution called forth by his book on the *Meritorious Price of Christ's Redemption* The town was burned by the Indians in 1675, and in 1787 the arsenal was attacked by Shays's rebels The opening of the Boston and Albany Railroad in 1839 was the beginning of rapid development, and the town was made a city in 1852 The manufacture of firearms carried on here during the Civil War, 1861-65, gave the city a great impulse

SPRINGFIELD, a city of the United States, county seat of Greene county, Missouri, occupies a pleasant and healthy site on the Ozark Hills, 238 miles by rail south-west of St Louis by the St Louis and San Francisco Railroad, which here joins with the Kansas City, Fort Scott, and Gulf Railroad Springfield is the chief commercial centre of south-west Missouri, one of the great lead and zinc mining districts of the States It contains a number of factories (cotton, wool, waggons, furniture, tobacco, &c), and is the seat of a court-house and of Drury College (1873), which provides scientific and classical training and has a musical conservatory attached The population was 5555 in 1870, 6522 in 1880, and in 1886 was estimated at 18,000

Originally an Indian trading post and frontier village, Springfield was incorporated in 1830 and began to be a prosperous place at the close of the Civil War, during which it had several times changed hands and been the scene of hostilities

SPRINGFIELD, a city of the United States, county seat of Clarke county, Ohio, lies at the confluence of Mad river and Lagonda Creek (sub-tributaries of the Ohio through the Miami), 84 miles north-east of Cincinnati It has a large trade in the agricultural produce of the fertile and populous district in which it is pleasantly situated, and is the seat of a very large manufactory of agricultural machinery, which turns out 75,000 reapers and mowers per annum, besides grain-drills, steam-engines, cider-mills, and a great variety of articles In 1870 the population of the city was 12,652, in 1880 20,730 (township, 24,455), and 33,484 in 1886 Among the public institutions are Wittenberg College (Lutheran), founded in 1845, and a small public library

SPRUCE See FIR, vol ix p 222

SPURZHEIM, KASPAR, phrenologist, was born at Longwich near Treves on 31st December 1776, and died at Boston, United States, on 10th November 1832 See PHRENOLOGY

SQUARING (or QUADRATURE) OF THE CIRCLE is the problem of finding a square equal in area to a given circle Like all problems, it may be increased in difficulty by the imposition of restrictions, consequently under the designation there may be embraced quite a variety of geometrical problems It has to be noted, however, that, when the "squaring" of the circle is especially spoken of, it is almost always tacitly assumed that the restrictions are those of the Euclidean geometry

Since the area of a circle equals that of the rectilineal triangle whose base has the same length as the circumference and whose altitude equals the radius (Archimedes, Κύκλου μέτρησις, prop 1), it follows that, if a straight line could be drawn equal in length to the circumference, the required square could be found by an ordinary Euclidean construction, also, it is evident that, conversely, if a square equal in area to the circle could be obtained, it would be possible to draw a straight line equal to the circumference Rectification and quadrature of the circle have thus been, since the time of Archimedes at least, practically identical problems Again, since the circumferences of circles are proportional to their diameters—a proposition assumed to be true from the dawn almost of practical geometry—the rectification of the circle is seen to be transformable into finding the ratio of the circumference to the diameter This correlative numerical problem and the two purely geometrical problems are inseparably connected historically

Probably the earliest value for the ratio was 3 It was so among the Jews (1 Kings vii 23, 26), the Babylonians (Oppert, *Journ Asiatique*, August 1872, October 1874), the Chinese (Biot, *Journ Asiatique*, June 1841), and probably also the Greeks Among the ancient Egyptians, as would appear from a calculation in the Rhind papyrus, the number $(\frac{4}{3})^4$, *i e*, 3 16 , was at one time in use [1] The first attempts to solve the purely geometrical problem appear to have been made by the Greeks (Anaxagoras, &c),[2] one of whom, Hippocrates,[3] doubtless raised hopes of a solution by his quadrature of the so-called *menisci* As for Euclid, it is sufficient to recall the facts that the original author of prop 8 of book iv had strict proof of the ratio being <4, and the author of prop 15 of the ratio being >3, and to direct attention to the importance

of book x on incommensurables and props 2 and 16 of book xii, viz, that "circles are to one another as the squares on their diameters" and that "in the greater of two concentric circles a regular $2n$-gon can be inscribed which shall not meet the circumference of the less," however nearly equal the circles may be. With Archimedes (287-212 B.C.) a notable advance was made. Taking the circumference as intermediate between the perimeters of the inscribed and the circumscribed regular n-gons, he showed that, the radius of the circle being given and the perimeter of some particular circumscribed regular polygon obtainable, the perimeter of the circumscribed regular polygon of double the number of sides could be calculated, that the like was true of the inscribed polygons, and that consequently a means was thus afforded of approximating to the circumference of the circle. As a matter of fact, he started with a semi-side AB of a circumscribed regular hexagon meeting the circle in B (see fig 1), joined A and B with O the centre, bisected the $\angle$AOB by OD, so that BD became the semi-side of a circumscribed regular 12-gon, then as AB : BO : OA = 1 : $\sqrt{3}$: 2 he sought an approximation to $\sqrt{3}$ and found that AB : BO > 153 : 265. Next he applied his theorem[1] BO + OA : AB = OB : BD to calculate BD, from this in turn he calculated the semi-sides of the circumscribed regular 24-gon, 48-gon, and 96-gon, and so finally established for the circumscribed regular 96-gon that perimeter : diameter < $3\frac{1}{7}$: 1.

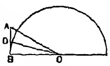

Fig 1

In a quite analogous manner he proved for the inscribed regular 96-gon that perimeter : diameter > $3\frac{10}{71}$: 1. The conclusion from these therefore was that the ratio of circumference to diameter is < $3\frac{1}{7}$ and > $3\frac{10}{71}$. This is a most notable piece of work, the immature condition of arithmetic at the time was the only real obstacle preventing the evaluation of the ratio to any degree of accuracy whatever.[2]

No advance of any importance was made upon the achievement of Archimedes until after the revival of learning. His immediate successors may have used his method to attain a greater degree of accuracy, but there is very little evidence pointing in this direction. Ptolemy (fl 127-151), in the *Great Syntaxis*, gives 3.141552 as the ratio[3], and the Hindus (*c* 500 A.D.), who were very probably indebted to the Greeks, used 62832/20000, that is, the now familiar 3.1416.[4] It was not until the 15th century that attention in Europe began to be once more directed to the subject, and after the resuscitation a considerable length of time elapsed before any progress was made. The first advance in accuracy was due to a certain Adrian, son of Anthony, a native of Metz (1527), and father of the better-known Adrian Metius of Alkmaar. In refutation of Duchesne (Van der Eycke) he showed that the ratio was < $3\frac{17}{120}$ and > $3\frac{15}{106}$, and thence made the exceedingly lucky step of taking a mean between the two by the quite unjustifiable process of halving the sum of the two numerators for a new numerator and halving the sum of the two denominators for a new denominator, thus arriving at the now well-known approximation $3\frac{16}{113}$ or $\frac{355}{113}$, which, being equal to 3.1415929..., is correct to the sixth fractional place.[5] The next to advance the calculation was Viète (De Viette, Vieta), the greatest mathematician of his age. By finding the perimeter of the inscribed and that of the circumscribed regular polygon of 393216 (*i.e.*, 6×2^{16}) sides, he proved that the ratio was > 3.1415926535 and < 3.1415926537, so that its value became known (in 1579) correctly to 10 fractional places. The theorem for angle-bisection which Viète used was not that of Archimedes, but that which would now appear in the form $1 - \cos\theta = 2\sin^2\frac{1}{2}\theta$. With Viète, by reason of the advance in arithmetic, the style of treatment becomes more strictly trigonometrical, indeed, the *Universales Inspectiones*, in which the calculation occurs, would now be called plane and spherical trigonometry, and the accompanying *Canon Mathematicus*, a table of sines, tangents, and secants.[6] Further, in comparing the labours of Archimedes and Viète, the effect of increased power of symbolical expression is very noticeable. Archimedes's process of unending cycles of arithmetical operations could at best have been expressed in his time by a "rule" in words, in the 16th century it could be condensed into a "formula." Accordingly, we find in Viete a formula for the ratio of diameter to circumference, viz, the interminate product[7]—

$$\tfrac{1}{2}\sqrt{\tfrac{1}{2}}\cdot\sqrt{\tfrac{1}{2}+\tfrac{1}{2}\sqrt{\tfrac{1}{2}}}\cdot\sqrt{\tfrac{1}{2}+\tfrac{1}{2}\sqrt{\tfrac{1}{2}+\tfrac{1}{2}\sqrt{\tfrac{1}{2}}}}\ldots$$

From this point onwards, therefore, no knowledge whatever of geometry was necessary in any one who aspired to determine the ratio to any required degree of accuracy, the mere arithmetician's art and length of days were the only requisites. Thus in connexion with the subject a genus of workers became possible who may be styled "π-computers,"—a name which, if it connotes anything uncomplimentary, does so because of the almost entirely fruitless character of their labours. Passing over Adriaan van Roomen (Adrianus Romanus) of Louvain, who published the value of the ratio correct to 15 places in his *Idea Mathematica* (1593),[8] we come to the notable computer Ludolph van Ceulen (d 1610), a native of Germany, long resident in Holland. His book, *Van den Cirkel* (Delf, 1596), gave the ratio correct to 20 places, but he continued his calculations as long as he lived, and his best result was published on his tombstone in St Peter's church, Leyden. The inscription, which is not known to be now in existence,[9] is in part as follows:—

Qui in vita sua multo labore circumferentiae circuli proximam rationem ad diametrum invenit sequentem—

quando diameter est 1

tum circuli circumferentia plus est

quam $\frac{314159265358979323846264338327950288}{100000000000000000000000000000000000}$

et minus

quam $\frac{314159265358979323846264338327950289}{100000000000000000000000000000000000}$.

This gives the ratio correct to 35 places. Van Ceulen's process was essentially identical with that of Viète. Its numerous root extractions amply justify a stronger expression than "multo labore," especially in an epitaph. In Germany the "Ludolphische Zahl" is still a common name for the ratio.[10]

Up to this point the credit of most that had been done may be set down to Archimedes. A new departure, however, was made by Willebrord Snell of Leyden in his *Cyclometria*, published in 1621. His achievement was a closely approximate geometrical solu-

tion of the problem of rectification (see fig 2) ACB being a semicircle whose centre is O, and AC the arc to be rectified, he produced AB to D, making BD equal to the radius, joined DC, and produced it to meet the tangent at A in E, and then his assertion (not established by him) was that AE was nearly equal to the arc AC, the error being in defect For the purposes of the calculator a solution erring in excess was also required, and this Snell gave by slightly varying the former construction Instead of producing AB (see fig 3) so that BD was equal to r, he produced it only so far that, when the extremity D′ was joined with C, the part of D′C outside the circle was equal to r, in other words, by a non-Euclidean construction he trisected the angle AOC, for it is readily seen that, since FD′ = FO = OC, the angle FOB = $\frac{1}{3}$AOC [1] This couplet of constructions is as important from the calculator's point of view as it is interesting geometrically

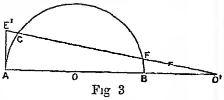

Fig 3

To compare it on this score with the fundamental proposition of Archimedes, the latter must be put into a form similar to Snell's AMC being an arc of a circle (see fig. 4) whose centre is O, AC its chord, and HK the tangent drawn at the middle point of the arc and bounded by OA, OC produced, then, according to Archimedes, AMC < HK but > AC In modern trigonometrical notation the propositions to be compared stand as follows —

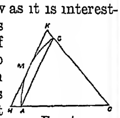

Fig 4

$$2\tan\tfrac{1}{2}\theta > \theta > 2\sin\tfrac{1}{2}\theta \quad \text{(Archimedes)},$$

$$\tan\tfrac{1}{3}\theta + 2\sin\tfrac{1}{3}\theta > \theta > \frac{3\sin\theta}{2+\cos\theta} \quad \text{(Snell)}$$

It is readily shown that the latter gives the best approximation to θ, but, while the former requires for its application a knowledge of the trigonometrical ratios of only one angle (in other words, the ratios of the sides of only one right-angled triangle), the latter requires the same for two angles, θ and $\frac{1}{3}\theta$ Grienberger, using Snell's method, calculated the ratio correct to 39 fractional places [2] Huygens, in his *De Circuli Magnitudine Inventa*, 1654, proved the propositions of Snell, giving at the same time a number of other interesting theorems, for example, two inequalities which may be written as follows [3]—

$$\text{chd}\,\theta + \frac{4\,\text{chd}\,\theta + \sin\theta}{2\,\text{chd}\,\theta + 3\sin\theta}\,\tfrac{1}{3}(\text{chd}\,\theta - \sin\theta) > \theta > \text{chd}\,\theta + \tfrac{1}{3}(\text{chd}\,\theta - \sin\theta)$$

As might be expected, a fresh view of the matter was taken by Descartes The problem he set himself was the exact converse of that of Archimedes A given straight line being viewed as equal in length to the circumference of a circle, he sought to find the diameter of the circle His construction is as follows (see fig 5) Take AB equal to one-fourth of the given line, on AB describe a square ABCD, join AC, in AC produced find, by a known process, a point C_1 such that, when C_1B_1 is drawn perpendicular to AB produced and C_1D_1 perpendicular to BC produced, the rectangle BC_1 will be equal to $\frac{1}{4}$ABCD, by the same process find a point C_2 such that the rectangle B_1C_2 will be equal to $\frac{1}{4}BC_1$, and so on *ad infinitum* The diameter sought is the straight line from A to the limiting position of the series of B's, say the straight line AB_∞ As in the case of the process of Archimedes, we may direct our attention either to the infinite series of geometrical operations or to the corresponding infinite series of arithmetical operations Denoting the number of units in AB by $\frac{1}{4}c$, we can express BB_1, B_1B_2, in terms of $\frac{1}{4}c$, and the identity $AB_\infty = AB + BB_1 + B_1B_2 +$ gives us at once an expression for the diameter in terms of the circumference by means of an infinite series [4] The proof of the correctness of the construction is seen to be involved in the following theorem, which serves likewise to throw new light on the subject —AB being any straight line whatever, and the above construction being made, then AB is the diameter of the circle circumscribed by the square ABCD (self-evident), AB_1 is the diameter of the circle circumscribed by the regular 8-gon having the same perimeter as the square, AB_2 is the diameter of the circle circumscribed by the regular 16-gon having the same perimeter as the square, and so on Essentially, therefore, Descartes's process is that known later as the process of *isoperimeters*, and often attributed wholly to Schwab [5]

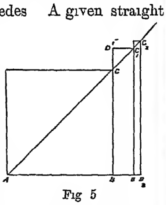

Fig 5

In 1655 appeared the *Arithmetica Infinitorum* of Wallis, where numerous problems of quadrature are dealt with, the curves being now represented in Cartesian coordinates, and algebra playing an important part In a very curious manner, by viewing the circle $y=(1-x^2)^{\frac{1}{2}}$ as a member of the series of curves $y=(1-x^2)^1$, $y=(1-x^2)^2$, &c, he was led to the proposition that four times the reciprocal of the ratio of the circumference to the diameter is equal to

$$\frac{3\cdot3\cdot5\cdot5\cdot7\cdot7\cdot9\ \ldots}{2\cdot4\cdot4\cdot6\cdot6\cdot8\cdot8\ \ldots},$$

and the result having been communicated to Lord Brounker, the latter discovered the equally curious equivalent expression

$$1+\cfrac{1^2}{2+\cfrac{3^2}{2+\cfrac{5^2}{2+\cfrac{7^2}{2+\ldots}}}}$$

The work of Wallis had evidently an important influence on the next notable personality in the history of the subject, James Gregory, who lived during the period when the higher algebraic analysis was coming into power, and whose genius helped materially to develop it He had, however, in a certain sense one eye fixed on the past and the other towards the future His first contribution [6] was a variation of the method of Archimedes The latter, as we know, calculated the perimeters of successive polygons, passing from one polygon to another of double the number of sides, in a similar manner Gregory calculated the areas The general theorems which enabled him to do this, after a start had been made, are

$$A_{2n} = \sqrt{A_n A'_n} \quad \text{(Snell's } Cyclom\text{)},$$

$$A'_{2n} = \frac{2A_n A'_n}{A_n + A_{2n}} \text{ or } \frac{2A'_n A_{2n}}{A'_n + A_{2n}} \quad \text{(Gregory)},$$

where A_n, A'_n are the areas of the inscribed and the circumscribed regular n-gons respectively He also gave approximate rectifications of circular arcs after the manner of Huygens, and, what is very notable, he made an ingenious and, according to Montucla, successful attempt to show that quadrature of the circle by a Euclidean construction was impossible [7] Besides all this, however, and far beyond it in importance, was his use of infinite series This merit he shares with his contemporaries Mercator, Newton, and Leibnitz, and the exact dates of discovery are a little uncertain As far as the circle-squaring functions are con-

[1] It is thus manifest that by his first construction Snell gave an approximate solution of two great problems of antiquity

cerned, it would seem that Gregory was the first (in 1670) to make known the series for the arc in terms of the tangent, the series for the tangent in terms of the arc, and the secant in terms of the arc, and in 1669 Newton showed to Barrow a little treatise in manuscript containing the series for the arc in terms of the sine, for the sine in terms of the arc, and for the cosine in terms of the arc These discoveries formed an epoch in the history of mathematics generally, and had, of course, a marked influence on after investigations regarding circle-quadrature Even among the mere computers the series

$$\theta=\tan\theta-\tfrac{1}{3}\tan^3\theta+\tfrac{1}{5}\tan^5\theta-$$

specially known as Gregory's series, has ever since been a necessity of their calling

The calculator's work having now become easier and more mechanical, calculation went on apace In 1699 Abraham Sharp, on the suggestion of Halley, took Gregory's series, and, putting $\tan\theta=\frac{1}{3}\sqrt{3}$, found the ratio equal to

$$\sqrt{12}\left(1-\frac{1}{3\ 3}+\frac{1}{5\ 3^2}-\frac{1}{7\ 3^3}+\quad\right),$$

from which he calculated it correct to 71 fractional places [1] About the same time Machin calculated it correct to 100 places, and, what was of more importance, gave for the ratio the rapidly converging expression,

$$\frac{16}{5}\left(1-\frac{1}{3\ 5^2}+\frac{1}{5\ 5^4}-\frac{1}{7\ 5^6}+\quad\right)-\frac{4}{239}\left(1-\frac{1}{3\ 239^2}+\frac{1}{5\ 239^4}-\quad\right),$$

which long remained without explanation [2] Fautet de Lagny, still using tan 30°, advanced to the 127th place [3]

Euler took up the subject several times during his life, effecting mainly improvements in the theory of the various series [4] With him, apparently, began the usage of denoting by π the ratio of the circumference to the diameter [5] The most important publication, however, on the subject in the 18th century was a paper by Lambert,[6] read before the Berlin Academy in 1761, in which he demonstrated the irrationality of π The general test of irrationality which he established is that, if

$$\cfrac{a_1}{b_1\pm\cfrac{a_2}{b_2\pm\cfrac{a_3}{b_3\pm}}}$$

be an interminate continued fraction, $a_1, a_2 \quad, b_1, b_2$ be integers, $\frac{a_1}{b_1}, \frac{a_2}{b_2}, \quad$ be proper fractions, and the value of every one of the interminate continued fractions $\cfrac{a_1}{b_1\pm}\quad,\ \cfrac{a_2}{b_2\pm}\quad,$ be < 1, then the given continued fraction represents an irrational quantity If this be applied to the right-hand side of the identity

$$\tan\frac{m}{n}=\cfrac{\frac{m}{n}}{1-\cfrac{\frac{m^2}{n^2}}{3-\cfrac{\frac{m^2}{n^2}}{5-}}}\quad,$$

it follows that the tangent of every arc commensurable with the radius is irrational, so that, as a particular case, an arc of 45°, having its tangent rational, must be incommensurable with the radius, that is to say, $\frac{\pi}{4}$ is an incommensurable number [7] This incontestable result had no effect, apparently, in repressing the π-computers Vega in 1789, using series like Machin's, viz, Gregory's series and the identities

$$\frac{\pi}{4}=5\tan^{-1}\tfrac{1}{7}+2\tan^{-1}\tfrac{3}{79}\ \text{(Euler, 1779)},$$

$$\frac{\pi}{4}=\ \tan^{-1}\tfrac{1}{7}+2\tan^{-1}\tfrac{1}{3}\ \text{(Hutton, 1776)},$$

neither of which was nearly so advantageous as several found by Hutton, calculated π correct to 136 places [8] This achievement was anticipated or outdone by an unknown calculator, whose manuscript was seen in the Radcliffe Library, Oxford, by Baron von Zach towards the end of the century, and contained the ratio correct to 152 places More astonishing still have been the deeds of the π-computers of the 19th century A condensed record compiled by Mr Glaisher (*Messenger of Math*, ii p 122) is as follows —

Date	Computer	No of fr digits calcd	No of fr digits correct	Place of Publication
1842	Rutherford	208	152	*Trans Roy Soc*, Lond, 1841, p 283
1844	Dase	205	200	*Crelle's Journ*, xxvii p 198
1847	Clausen	250	248	*Astron Nachr*, xxv col 207
1853	Shanks	318	318	*Proc Roy Soc*, Lond, 1853, p 273
1853	Rutherford	440	440	*Ibid*
1853	Shanks	530		*Ibid*
1853	Shanks	607		W Shanks, *Rectification of the Circle*, London, 1853
1853	Richter	333	330	*Grunert's Archiv*, xxi p 119
1854	Richter	400	330	*Ibid*, xxii p 473
1854	Richter	400	400	*Ibid*, xxiii p 476
1854	Richter	500	500	*Ibid*, xxv p 472
1873	Shanks	707		*Proc Roy Soc*, Lond, xxi

By these computers Machin's identity, or identities analogous to it, *e g*,

$$\frac{\pi}{4}=\ \tan^{-1}\tfrac{1}{2}+\tan^{-1}\tfrac{1}{5}\ +\tan^{-1}\tfrac{1}{8},$$

$$\frac{\pi}{4}=4\tan^{-1}\tfrac{1}{5}-\tan^{-1}\tfrac{1}{70}+\tan^{-1}\tfrac{1}{99},$$

and Gregory's series were employed [9]

A much less wise class than the π-computers of the 19th century are the pseudo-circle-squarers, or circle-squarers technically so called, that is to say, persons who, having obtained by illegitimate means a Euclidean construction for the quadrature or a finitely expressible value for π, insist on using faulty reasoning and defective mathematics to establish their assertions Such persons have flourished at all times in the history of mathematics, but the interest attaching to them is more psychological than mathematical [10]

It is of recent years that the most important advances in the theory of circle-quadrature have been made In 1873 Hermite proved that the base ϵ of the Napierian logarithms cannot be a root of a rational algebraical equation of any degree [11] To prove the same proposition regarding π is to prove that a Euclidean construction for circle-quadrature is impossible. For in such a construction every point of the figure is obtained by the intersection of two straight lines, a straight line and a circle, or two circles, and, as this implies that, when a unit of length is introduced, numbers employed, and the problem transformed into one of algebraic geometry, the equations to be solved can only be of the first or second degree, it follows that the equation to which we must be finally led is a rational equation of even degree Hermite[12] did not

succeed in his attempt on π, but in 1882 Lindemann, following exactly in Hermite's steps, accomplished the desired result[1] Mathematicians are agreed that the full demonstration leaves something to be desired in the matter of simplicity, and attempts at simplification have already been made by Markoff and Rouche[2]

SQUASH (*Cucurbita Melopepo*) See GOURD

SQUILL, the name under which the bulbous root of *Urginea maritima*, Baker, is used in medicine The plant was formerly placed in the genus *Scilla*, from which it has been separated because the seeds are flat and discoid instead of triquetrous, as in the latter genus The name of "squill" is also applied by gardeners to the various species of *Scilla* The medicinal squill is a native of the countries bordering the Mediterranean, and grows from the sea-level up to an elevation of 3000 feet The bulbs are globular and of large size, often weighing more than 4 ℔ Two varieties are met with, the one having white and the other pink scales They are collected in August, when they are leafless, the membranous outer scales being removed and the fleshy portion cut transversely into slices and dried in the sun These are then packed in casks for exportation They are chiefly imported into the United Kingdom from Malta When reduced to powder and exposed to the air the drug rapidly absorbs moisture and cakes together into a hard mass Squill has been used in medicine from a very early period The ancient Greek physicians prescribed it with vinegar and honey almost in the same manner as it is used at present Its medicinal properties are expectorant and diuretic It is chiefly prescribed in bronchitis when the phlegm is tenacious and expectorated with difficulty, and in cardiac dropsy When given in large doses it acts as an irritant poison, and its use is therefore contra-indicated in active inflammatory conditions of the mucous membrane or of the kidneys The fresh bulb rubbed on the skin causes redness and irritation, due in part to the presence of minute crystals of oxalate of calcium

The activity of the drug appears to be due to the active principles, scillipicrin, scillitoxin, and scillin, which were first obtained by Merck in 1878 The first has a bitter and burning taste, powerfully irritating the mucous membrane of the nose It is soluble in alcohol and ether and partly in alkalis, but insoluble in water, if mixed with sugar it dissolves readily and can then be absorbed if injected subcutaneously Scillitoxin is hygroscopic, very soluble in water, and has a bitter taste These two principles have an action on the heart resembling that of *Digitalis*, in large doses the former stops its action in systole and the latter in diastole Scillin is crystalline, tasteless and soluble in alcohol, though only with difficulty in water It is present only in very small quantity in squill, and appears to be the cause of the subsidiary effects of that drug, such as vomiting, &c

An allied species, *Urginea indica*, Baker, is used in India in the same manner as the European species The true squills are represented in Great Britain by two species, *Scilla autumnalis* and *S verna* The former has a racemose inflorescence, the latter has the flowers arranged in a corymbose manner, and is confined to the sea-coast Several species are cultivated in gardens, *S bifolia* and *S sibirica* being remarkable for their beautiful blue flowers, which are produced in early spring The name of Chinese squill is applied by gardeners to *Barnardia scilloides* and that of Roman squill to species of *Bellevalia*

SQUINT See OPHTHALMOLOGY, vol xvii p 785

SQUIRREL In the article MARMOT (vol xv p 559) an account was given of the three genera forming the *Arctomyina*, or Marmot sub-family of the large family *Sciuridæ*, and in the present article the members of the other and more typical sub-family, the *Sciurina*, are noticed The systematic position of the *Sciuridæ* as a whole and their relations to other rodents are shown in the article MAMMALIA (vol xv p 418), so it is merely with the component genera of the group that we now have to deal

Of the *Sciurina* six genera are commonly recognized, the first being the typical one, *Sciurus*, in which the common English squirrel is included The characters of the genus are—form slender and agile, tail long and bushy, ears generally well developed, pointed, often tufted, feet adapted for climbing, the anterior pair with four toes and a rudimentary thumb, and the posterior pair with five toes, all the toes having long, curved, and sharp-pointed claws, mammæ from four to six in number, skull (see fig 1) lightly built, very similar in

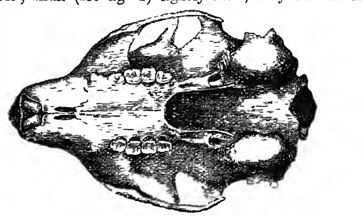

FIG 1 —Skull of *Sciurus bicolor*, natural size

shape throughout the genus, post-orbital processes long and curved, incisors narrow and compressed, premolars either one or two above and one below, when two are present above, the anterior one is quite minute and very different from the corresponding tooth in the marmots, molars three on each side above and below.

True squirrels are found throughout the greater part of the tropical and temperate regions of both hemispheres, although they are absent both from Madagascar and the Australian region The species are both largest and most numerous in the tropics, and reach their greatest development in the Malay parts of the Oriental region.

Squirrels vary in size from animals no larger than a mouse, such as *Sciurus soricinus* of Borneo, or *S minutus* of West Africa, to others as large as a cat, such as the black and yellow *S bicolor* of Malaysia (see fig 1) The very large squirrels, as might be expected from their heavier build, are somewhat less strictly arboreal in their habits than the smaller ones, of which the common English species may be looked upon as typical The Common Squirrel, *S vulgaris*, whose general habits are too well known to need special description, ranges over the whole of the Palæarctic region, from Ireland to Japan, from Lapland to North Italy, but specimens from different parts of this wide range differ so much in colour as to have been often looked upon as different species. Thus, while the common squirrels of north and west Europe are of the bright red colour we are accustomed to see in England, those of the mountainous regions of southern Europe are nearly always of a deep blackish grey, those from Siberia again are a clear pale grey colour, with scarcely a tinge of rufous These last supply the squirrel fur used for lining cloaks The pairing time of the squirrel is from February to April, and after a period of gestation of about thirty days it brings forth from three to nine young In addition to all sorts of vegetables and fruits the squirrel is exceedingly fond of animal food, greedily devouring mice, small birds, and eggs

Although the English squirrel is a most beautiful little

[2] *Nouv Annales*, 3d ser, ii p 5

animal, it is far surpassed by many of the tropical members of the group, and especially by those of the Malayan region, where nearly all the numerous species are brilliantly marked, and many are ornamented with variously coloured longitudinal stripes along their bodies. One of the commonest and best known of the striped species is the little Indian Palm Squirrel (*S. palmarum*), which in large numbers runs about every Indian village. Another Oriental species (*S. caniceps*) presents almost the only known instance among mammals of the temporary assumption during the breeding season of a distinctly ornamental coat, corresponding to the breeding plumage of birds. For the greater part of the year the animal is of a uniform grey colour, but about December its back becomes a brilliant orange-yellow, which lasts until about March, when it is again replaced by grey. The squirrel shown in fig. 2 is a native of Burmah and Tenasserim, and is

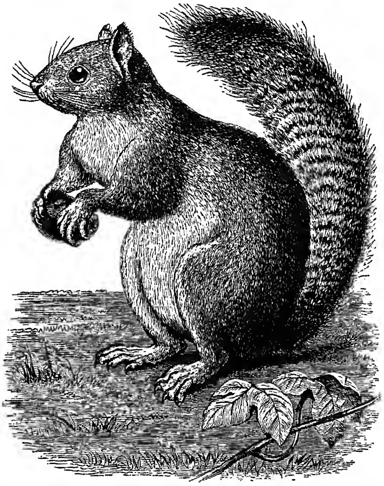

Fig. 2.—Burmese squirrel.

closely allied to *S. caniceps*, but goes through no seasonal change of colour.

The number of species in the genus *Sciurus* is about 75, of which 3 belong to the Palæarctic, 15 to the Ethiopian, about 40 to the Oriental, and 16 to the combined Nearctic and Neotropical regions.

Genus Rheithrosciurus.

A single very striking species of squirrel, confined to Borneo, and as yet only known from three or four examples, has been separated generically under the above name. The general shape of its skull is very different from that of other squirrels; but its most peculiar characteristic is the presence of from seven to ten minute parallel vertical grooves running down the front face of its incisors, both above and below, no other squirrel having really grooved incisors at all, and no other member of the whole order of rodents incisor grooves resembling these. Its premolars only number $\frac{1}{1}$, and its molars are simpler and less ridged than in the other genera. This squirrel (*Rh. macrotis*) is a magnificent animal, far larger than the English species, with an enormously long bushy tail, long tufted ears, and black and white bands down its sides.

Genus Xerus.

Fur coarse and spiny. Claws long and comparatively straight. Ear-conches minute or entirely absent. Skull with the post-orbital processes short and directed backwards, the bony palate prolonged considerably behind the tooth-row, and the external ridge on the front face of the anterior zygoma-root more developed, and continued much further upwards, than in *Sciurus*. Premolars $\frac{2}{1}$; molars as in *Sciurus*. This genus contains four well-marked species, known as Spiny Squirrels, all natives of Africa. They are terrestrial in their habits, living in burrows which they dig for themselves. *X. getulus*, a striped species of North Africa, has much the size and appearance of the Indian palm squirrel; the others are all a little larger than the English squirrel.

Genus Tamias.

The members of this genus are characterized by the possession of internal cheek-pouches, and by their style of coloration, all being ornamented on the back with alternate bands of light and dark colour. Their skulls are slenderer and lighter than those of the true squirrels, from which they differ in several unimportant details. There is only one functional premolar,—the small anterior one usually found in *Sciurus* being either absent altogether or quite small and functionless. There are four species, all found in North America, one extending also through Siberia into eastern Europe. They are known in America as "Chipmunks," and are among the commonest and best known of the indigenous rodents. The members of this group seem rather to lead into the genus *Spermophilus* (see MARMOT) of the sub-family *Arctomyina*, so that the division of the *Sciuridæ* into two sub-families, although very convenient for classification and description, is rather of an artificial nature, there being no well-defined line of separation between them.

Genera Pteromys and Sciuropterus.

The Flying Squirrels, although they cannot fly in the true sense of the word, can yet float through the air for considerable distances by the aid of an extension of skin connecting their fore and hind limbs, and forming a sort of parachute. This parachute is merely a lateral extension of the ordinary skin of the body, which passes outwards between the limbs and terminates at the wrists and ankles. In addition to the lateral membrane there is a narrow and inconspicuous one passing from the cheek along the front of the shoulder to the front of the wrist, and another—at least in the larger species—stretching across behind the body from ankle to ankle and involving the base of the tail. The flying squirrels are divided into two genera, of which *Pteromys* contains the larger and *Sciuropterus* the smaller species. The two differ in certain details of dentition, and in the greater development in the former of the expanded membranes, especially of the "interfemoral" or posterior membrane, which is in the latter almost wholly absent. In *Pteromys* the tail is cylindrical and comparatively thin, while in *Sciuropterus* it is broad, flat, and laterally expanded, and evidently compensates for the absence of the interfemoral membrane by acting as a supplementary parachute. In appearance flying squirrels resemble the non-flying forms, although they are even more beautifully coloured than the latter. Their habits, food, &c., are also very similar to those of the true squirrels, except that they are more decidedly nocturnal, and are therefore less often seen by the ordinary observer. Their method of leaping from tree to tree and floating long distances on their extended parachutes is precisely similar to that of the flying phalangers of Australia, a graphic description of which is quoted in PHALANGER (vol. xviii. p. 729). Of each of the two genera there are about thirteen or fourteen species, all natives of the Oriental region, except that one of *Sciuropterus* is found in North America, and another in Siberia and eastern Europe,—the latter, the *Sciurus volans* of Linnæus's *Systema Naturæ*, being the first flying squirrel that was known to European naturalists. (O. T.)

SRINAGAR. See KASHMIR, vol. xiv. p. 11.

SRÍRANGAM, or SERINGHAM, a town of India, in Trichinopoli district, Madras presidency, situated in 10° 51′ 50″ N. lat. and 78° 43′ 55″ E. long., 2 miles north of Trichinopoli city and almost in the centre of the island of Srírangam. The island is formed by the bifurcation of the river Káveri (Cauvery) and by the channel of the Colerun. The town is celebrated for its great temple dedicated to Vishnu, composed of seven square enclosures, 350 feet distant from each other. Each enclosure has four gates with high towers, placed one in the centre of each side opposite to the four cardinal points. The outer wall of the temple is not less than 4 miles in circumference. From 1751 to 1755 the island and its pagodas were the object of frequent contests between the French and the British. Srírangam was constituted a municipality in 1871, and since then much has been done to improve the place. In 1881 the population was 19,773 (9330 males and 10,443 females).

SRIRANGAPATAM. See SERINGAPATAM.

STAAL, Marguerite Jeanne Cordier Delaunay, Baronne de (1684–1750)—often called in history and literature Madame de Staal-Delaunay, to distinguish her more completely from Madame de Stael-Holstein—was born at Paris on May 30, 1684 Her father was a painter named Cordier He seems to have deserted her mother, whose name was Delaunay, and who made her daughter take that surname instead of Cordier She was well-educated, and entered the household of the Duchesse du Maine at Sceaux, at first in no higher capacity than that of *femme de chambre* She was, however, promoted before long to the office of amanuensis and (practically) companion to her mistress Her literary talent soon manifested itself in the literary court of the duchess, who is said, but chiefly on the waiting lady's own authority, to have been not a little jealous of her attendant Enough, however, is known of the duchess's imperious and capricious temper to make it improbable that her service was agreeable Madame Delaunay, however, was a sufficiently devoted *suivante*, and in the affair of the Cellamare conspiracy had to endure a visit to the Bastille, where she remained for two years Even here, however, she represents herself as having made conquests, though she was far from beautiful She returned on her liberation to the service of the duchess, refused, it is said, Dacier, the widower of a wife more famous than himself, and in 1735, being then more than fifty, married the Baron de Staal She continued, however, to form part of the duchess's household She died on June 16, 1750 Her *Memoirs* appeared about five years later, and have often been reprinted, both separately and in collections of the memoirs of the 17th and 18th centuries, to both of which the author belonged both in style and character She has much of the frankness and seductive verve of Madame de Sévigne and her contemporaries, but a little alloyed with the *sensibilité* of a later time It may be doubted whether she does not somewhat exaggerate the discomforts of her position and her sense of them But her book is an extremely amusing one to read, as well as not a little instructive The humours of the "court of Sceaux" are depicted as hardly any other society of the kind has ever been Besides her *Memoirs* Madame de Staal left two comedies and some letters, the answers to which are in some cases extant, and show, as well as the references of contemporaries, that the writer did not exaggerate her power of attracting men

STADE, a small commercial town in the province of Hanover, Prussia, is situated on the navigable Schwinge, $3\frac{1}{2}$ miles above its confluence with the Elbe, and 20 miles to the north-west of Hamburg It carries on a number of small manufactures and has some shipping trade, chiefly with Hamburg, but the rise of Harburg has deposed it from its former position as the chief port of Hanover There are several brickfields in the neighbourhood, and deposits of gypsum and salt The fortifications, erected in 1755 and strengthened in 1816, began to be demolished in 1882 Population in 1885, 10,003

According to the legend, Stade was the oldest town of the Saxons and was built in 321 B C Historically it cannot be traced farther back than the 10th century, when it was the capital of a line of counts In the 12th century it passed to the archbishopric of Bremen Subsequently entering the Hanseatic League, it rose to some commercial importance [1] In 1648 Stade became the capital of the principality of Bremen under the Swedes, and in 1719 it was ceded to Hanover, the fate of which it has since shared. The Prussians occupied it without resistance in 1866

[1] The Stade Elbe-dues (Stader Elbezoll) were an ancient impost upon all goods carried up the Elbe, and were levied at the village of Brunshausen, at the mouth of the Schwinge The tax was abolished in 1267 by the Hanseatic League, but it was revived by the Swedes in 1688, and confirmed by Hanover The dues were fostered by the growing trade of Hamburg, and in 1861, when they were redeemed (for £427,600) by the nations trading in the Elbe, the exchequer of Hanover was in the yearly receipt of about £45,000 from this source Hamburg and Great Britain each paid more than a third of the redemption money

STAEL, Madame de (by her proper name and title Anne Louise Germaine Necker, Baroness of Stael-Holstein), was born at Paris on April 22, 1766, and died there on July 14, 1817 Her father was the famous financier Necker, her mother Suzanne Curchod, who is almost equally famous as the early love of Gibbon, as the wife of Necker, as the mistress of one of the most popular salons of Paris, and as the mother of Madame de Stael Between mother and daughter there was, however, little sympathy Madame Necker, despite her talents, her beauty, and her fondness for *philosophe* society, was strictly decorous, somewhat reserved, and disposed to carry out in her daughter's case the rigorous discipline of her own childhood The future Madame de Stael was from her earliest years a romp, a coquette, and passionately desirous of prominence and attention There seems moreover to have been a sort of rivalry between mother and daughter for the chief place in Necker's affections, and it is not probable that the daughter's love for her mother was increased by the consciousness of her own inferiority in personal charms Madame Necker, if her portraits as well as verbal descriptions may be trusted, was of a most refined though somewhat lackadaisical style of beauty, while her daughter was a plain child and a plainer woman, whose sole attractions were large and striking eyes and a buxom figure She was, however, a child of unusual intellectual power, and she began very early to write though not to publish She is said to have written her father a letter on his famous *Compte-Rendu* and other matters when she was not fifteen, and to have injured her health by excessive study and intellectual excitement But in reading all the accounts of Madame de Stael's life which come from herself or her intimate friends it must be carefully remembered that she was the most distinguished and characteristic product of the period of *sensibilité*—the singular fashion of ultra-sentiment which required that both men and women, but especially women, should be always palpitating with excitement, steeped in melancholy, or dissolved in tears Still, there is no doubt that her father's dismissal from the ministry, which followed the presentation of the *Compte*, and the consequent removal of the family from the busy life of Paris, were beneficial to her During part of the next few years they resided at Coppet, her father's estate on the Lake of Geneva, which she herself made famous But other parts were spent in travelling about, chiefly in the south of France They returned to Paris, or at least to its neighbourhood, in 1785, and Mademoiselle Necker resumed literary work of a miscellaneous kind, including two plays, *Sophie* and *Jane Grey*, which were printed sooner or later It became, however, a question of marrying her Her want of beauty was compensated by her fortune, for she was the only child of one of the richest bankers in Europe But her parents are said to have objected to her marrying a Roman Catholic, which, in France, considerably limited her choice There is a legend that William Pitt the younger thought of her, the somewhat notorious lover of Mademoiselle de Lespinasse, Guibert, a cold-hearted coxcomb of some talent, certainly paid her addresses But she finally married Eric Magnus, Baron of Stael-Holstein, who was first an attaché of the Swedish legation, and then minister For a great heiress and a very ambitious girl the marriage scarcely seemed brilliant, for Stael had no fortune and no very great personal distinction A singular series of negotiations, however, secured from the king of Sweden a promise of the ambassadorship for twelve years and a pension in case of

its withdrawal, and the marriage took place on January 14, 1786 The husband was thirty-seven, the wife twenty Madame de Stael was accused of extravagance, and latterly an amicable separation of goods had to be effected between the pair But this was a mere legal formality, and on the whole the marriage seems to have met the views of both parties, neither of whom had any affection for the other They had three children, there was no scandal between them, the baron obtained money and the lady obtained, as a guaranteed ambassadress of a foreign power of consideration, a much higher position at court and in society than she could have secured by marrying almost any Frenchman, without the inconveniences which might have been expected had she married a Frenchman superior to herself in rank The particular fancy of Marie Antoinette for Sweden, caused by the fantastic devotion of Count Fersen and the king himself to her, secured moreover a reception which might have been otherwise difficult to gain Madame de Stael was not a *persona grata* at court, but she seems to have played the part of ambassadress, as she played most parts, in a rather noisy and exaggerated manner, but not ill Then in 1788 she appeared as an author under her own name (*Sophie* had been already published, but anonymously) with some *Lettres sur J J Rousseau*, a fervid panegyric showing a good deal of talent but no power of criticism She was at this time, and indeed generally, enthusiastic for a mixture of Rousseauism and constitutionalism in politics, and her father's restoration to power excited extravagant hopes in her, though Necker himself knew better She exulted more than ever in the meeting of the states-general, and most of all when her father, after being driven to Brussels by a state intrigue, was once more recalled and triumphally escorted into Paris Every one knows what followed Her first child, a boy, was born the week before Necker finally left France in unpopularity and disgrace, and the increasing disturbances of the Revolution made her privileges as ambassadress no mere matters of ornamental distinction gratifying to vanity, but very important safeguards She visited Coppet once or twice, but for the most part in the early days of the revolutionary period she was in Paris taking an interest and, as she thought, a part in the councils and efforts of the Moderates At last, the day before the September massacres, she fled, befriended by Manuel and Tallien Her own account of her escape is, as usual, so florid that it provokes the question whether she was really in any danger Directly it does not seem that she was, but she had generously strained the privileges of the embassy to protect some threatened friends, and this was a serious matter

She betook herself to Coppet, and there gathered round her a considerable number of friends and fellow-refugees, the beginning of the quasi-court which at intervals during the next five-and-twenty years made the place so famous In 1793, however, she made a visit of some length to England, and established herself at Mickleham in Surrey as the centre of the Moderate Liberal emigrants, —Talleyrand, Narbonne, Jaucourt, Guibert, and others There was not a little scandal about her relations with Narbonne, and it is very much to be doubted whether this can safely be set down, as her panegyrists usually set it, to the mere spite of the first or royalist emigrants, to whom she and her party were almost more obnoxious than the Jacobins It is certain that this Mickleham sojourn (the details of which are known from, among other sources, the letters of Fanny Burney) has never been altogether satisfactorily accounted for. In the summer she returned to Coppet and wrote a pamphlet on the queen's execution The next year her mother died, and the fall of Robespierre opened the way back to Paris. M de Stael (whose mission had been in abeyance and himself in Holland for three years) was accredited to the French republic by the regent of Sweden, his wife reopened her salon and for a time was conspicuous in the motley and eccentric society of the Directory She also published several small works, the chief being an essay *De l'Influence des Passions* (1796), and another *De la Littérature Considérée dans ses Rapports avec les Institutions Sociales* (1800) It was during these years that Madame de Stael was of chief political importance Narbonne's place had been supplied by Benjamin Constant, who had a very great influence over her, as in return she had over him During the Directory she had some real and more imaginary power as a politician, and both personal and political reasons threw her into opposition to Bonaparte Her own preference for a moderate republic or a constitutional monarchy was quite sincere, and, even if it had not been so, her own character and Napoleon's were too much alike in some points to admit of their getting on together For some years, however, she was able to alternate between Coppet and Paris without difficulty, though not without knowing that the First Consul disliked her In 1797 she, as above mentioned, separated formally from her husband In 1799 he was recalled by the king of Sweden, and in 1802 he died duly attended by her Besides the eldest son Auguste Louis, they had two other children,—a son Albert, and a daughter Albertine, who afterwards became the Duchesse de Broglie

The exact date of the beginning of what Madame de Stael's admirers call her duel with Napoleon is not easy to determine Judging from the title of her book *Dix Années d'Exil*, it should be put at 1804, judging from the time at which it became pretty clear that the first man in France and she who wished to be the first woman in France were not likely to get on together, it might be put several years earlier The whole question of this duel, however (marked as it was by Napoleon's unscrupulous exercises of power, which reached a climax in the suppression of the *De l'Allemagne* after it had been carefully submitted to his censorship), requires consideration from the point of view of common sense It displeased Napoleon no doubt that Madame de Stael should show herself recalcitrant to his influence But it probably pleased Madame de Stael to quite an equal degree that Napoleon should apparently put forth his power to crush her and fail Both personages had the curious touch of *charlatanerie* so common in the late 18th century, and "made believe" in a fashion bewildering and a little incredible to posterity If Madame de Stael had really desired to take up her parable against Napoleon seriously, she need only have established herself in England at the peace of Amiens and have lived quietly there She did nothing of the kind She lingered on at Coppet, constantly hankering after Paris, and acknowledging the hankering quite honestly In 1802 she published the first of her really noteworthy books, the novel of *Delphine*, in which the "femme incomprise" was in a manner introduced to French literature, and in which she herself and not a few of her intimates appeared in transparent disguise In the autumn of 1803 she returned to Paris Whether, if she had not displayed such extraordinary anxiety not to be exiled, Napoleon would have exiled her remains a question, but, as she began at once appealing to all sorts of persons to protect her, he seems to have thought it better that she should not be protected She was directed not to reside within forty leagues of Paris, and after considerable delay she determined to go to Germany She journeyed by Metz and Frankfort to Weimar, and arrived there in December. There she stayed during the winter, and then went to Berlin, where she

made the acquaintance of August Wilhelm Schlegel, who afterwards became one of her intimates at Coppet. Thence she travelled to Vienna, where, in April, the news of her father's dangerous illness and shortly of his death (April 8) reached her. She returned to Coppet, and found herself its wealthy and independent mistress, but her sorrow for her father was deep and certainly sincere. She spent the summer at the chateau with a brilliant company; in the autumn she journeyed to Italy accompanied by Schlegel and Sismondi, and there gathered the materials of her most famous work, *Corinne*. She returned in the summer of 1805, and spent nearly a year in writing *Corinne*; in 1806 she broke the decree of exile and lived for a time undisturbed near Paris. In 1807 *Corinne*, the first æsthetic romance not written in German, appeared. It is in fact, what it was described as being at the time of its appearance, "a picturesque tour couched in the form of a novel." The publication was taken as a reminder of her existence, and the police of the empire sent her back to Coppet. She stayed there as usual for the summer, and then set out once more for Germany, visiting Mainz, Frankfort, Berlin, and Vienna. She was again at Coppet in the summer of 1808, and set to work at her book *De l'Allemagne*. It took her nearly the whole of the next two years, during which she did not travel much or far from her own house. She had bought property in America and thought of moving thither, but chance or fatality made her determine to publish *De l'Allemagne* in Paris. The submission to censorship which this entailed was sufficiently inconsistent, and she wrote to the emperor one of the unfortunate letters, at once undignified and provoking, of which she had the secret. A man less tyrannical or less mean-spirited than Napoleon would of course have let her alone, but Napoleon was Napoleon, and she perfectly well knew him. The reply to her letter was the condemnation of the whole edition of her book (ten thousand copies) as "not French," and her own exile, not as before to a certain distance from Paris, but from France altogether. The act was unquestionably one of odious tyranny, but it is impossible not to ask why she had put herself within reach of it when her fortune enabled her to reside anywhere and to publish what she pleased. She retired once more to Coppet, where she was not at first interfered with, and she found consolation in a young officer of Swiss origin named Rocca, twenty-three years her junior, whom she married privately in 1811. The intimacy of their relations could escape no one at Coppet, but the fact of the marriage was not certainly known till after her death.

The operations of the imperial police in regard to Madame de Stael are rather obscure. She was at first left undisturbed, but by degrees the chateau itself became taboo, and her visitors found themselves punished heavily. Mathieu de Montmorency and Madame Récamier were exiled for the crime of seeing her; and she at last began to think of doing what she ought to have done years before and withdrawing herself entirely from Napoleon's sphere. In the complete subjection of the Continent which preceded the Russian War this was not so easy as it would have been earlier, and she remained at home during the winter of 1811, writing and planning. On May 23 she left Coppet almost secretly, and journeyed by Bern, Innsbruck, and Salzburg to Vienna. There she obtained an Austrian passport to the frontier, and after some fears and trouble, receiving a Russian passport in Galicia, she at last escaped from the dungeon of Napoleonic Europe, swearing never to return thither. It seemed likely that the proclamation of war between France and Russia, on June 22, would help her to keep the vow.

She journeyed slowly though Russia and Finland to Sweden, making some stay at St Petersburg, spent the winter in Stockholm, and then set out for England. Here she received a brilliant reception and was much lionized during the season of 1813. She published *De l'Allemagne* (a book much more really remarkable than *Corinne*) in the autumn, was saddened by the death of her second son Albert, who had entered the Swedish army and fell in a duel brought on by gambling, undertook her *Considérations sur la Révolution Française*, and when Louis XVIII had been restored returned to Paris. Both in the summer and in the winter of 1814 she visited Coppet, and was meanwhile a prominent figure in Parisian society. She was in Paris when the news of Napoleon's landing arrived and at once fled to Coppet, but a singular story, much discussed, is current of her having approved Napoleon's return. There is no direct evidence of it, but the conduct of her close ally Constant may be quoted in its support, and it is certain that she had no affection for the Bourbons. In October, after Waterloo, she set out for Italy, not only for the advantage of her own health but for that of her second husband, Rocca, who was dying of consumption. Her daughter married Duke Victor de Broglie on February 20, 1816, at Pisa, and became the wife and mother of French statesmen of distinction. The whole family returned to Coppet in June, and Byron now frequently visited Madame de Stael there. He had quizzed her a good deal in London, but liked her better in her own house, though even there he noticed her constant straining to be something different from herself. Despite her increasing ill-health she returned to Paris for the winter of 1816–17, and her salon was much frequented. But in March she is spoken of as "dying," and she had already become confined to her room, if not to her bed. She died on the 14th of July, and Rocca survived her little more than six months. Nor was her eldest son long-lived. After editing a collected edition of his mother's works he died at the age of thirty-seven in 1827.

Madame de Stael occupies a singular position in French literature. The men of her own time exalted her to the skies, and the most extravagant estimates of her (as "the greatest woman in literary history," as the "foundress of the romantic movement," as representing "ideas," while her contemporary Chateaubriand only represented words, colours, and images, and so forth) are to be found in those histories of literature which faithfully repeat second hand and traditional opinions. On the other hand, it is acknowledged that she is now very little read. Sainte-Beuve, who professes a "culte" for her, and who has treated her at great length and with much indulgence, M Scherer, a compatriot and co-religionist, who is strongly prejudiced in her favour, Doudan, a kind of literary retainer of her connexions,—all allow this, and any one who speaks with an intimate knowledge of current French literature must agree that since they spoke neglect of her has increased. No writer of such eminence is so rarely quoted, none is so entirely destitute of that tribute of new and splendid editions which France pays to her favourite classics more lavishly than any other nation, none is so seldom the subject of a literary *causerie*. The abundant documents in the hands of her descendants, the families of Broglie and Haussonville, have indeed furnished material for papers recently, but these are almost wholly on the social aspect of Madame de Stael, not on her literary merit. Nor when the life and works come to be examined independently is the neglect seen to be without excuse. An ugly coquette, an old woman who made a ridiculous marriage, a blue-stocking who spent much of her time in pestering men of genius, and drawing from them sarcastic comment behind her back,—these things are not attractive. Her books are seen to be in large part merely clever reflexions of other people's views, or views current at the time, and the famous "ideas" turn out to be chiefly the ideas of the books or the men with whom she was from time to time in contact. The sentimentality of her sentiment and the florid magniloquence of her style equally disgust the reader; and, when it is suggested to him that the revolution of taste and manners hurts novels more than anything else, he is tempted to reply that it has not hurt *Don Quixote*, or *Gil Blas*, or *Robinson Crusoe*, or *Tom Jones*, or *Manon Lescaut*, or *The Antiquary*, and that if it has hurt *Corinne* it is simply because these are great books and *Corinne* is not a great book. There is truth in this, but to state it alone would be in the highest degree unfair. Madame de Stael's faults are great; her style is of an age not for

all time, her ideas are mostly second-hand and frequently superficial. But nothing save a very great talent could have shown itself so receptive. Take away her assiduous frequentation of society, from the later *philosophe* coteries to the age of Byron,—take away the influence of Constant and Schlegel and her other literary friends,—and probably little of her will remain. But to have caught from all sides in this manner the floating notions of society and of individuals, to reflect them with such vigour and clearness, to combine them with such not inconsiderable skill into connected books, is not anybody's task. Her two best books, *Corinne* and *De l'Allemagne*, are in all probability almost wholly unoriginal, a little sentiment in the first and a little constitutionalism in the second being all that she can claim. But *Corinne* is still a very remarkable exposition of a certain kind of æstheticism, and *De l'Allemagne* is still perhaps the most remarkable account of one country by a native and inhabitant of another which exists in literature. This praise, and it is very high praise, can be given to Madame de Stael. But the merits which it allows are not merits of the class which secure readers for ever. Neither in style nor in thought was she of the first class or perhaps of the second, and besides thought and style nothing will save books.

Baron Auguste de Stael edited, as has been said, the complete works of his mother in seventeen volumes (Paris, 1820–1), and the edition was afterwards republished in a compacter form, and, supplemented by some *Œuvres Inédites*, is still obtainable in 3 vols large 8vo (Didot). The *Considerations* and the *Dix Annees d'Exil* had been published after Madame de Stael's death. There is no recent reissue of the whole, and the minor works have not been reprinted, but *Corinne*, *Delphine*, and *De l'Allemagne* are easily accessible in cheap and separate forms. Of recent works on Madame de Stael, or rather on Coppet and its society, those of MM. Caro and Othenin d'Haussonville may be mentioned. In English there is an elaborate biography by A. Stevens (London, 1880), full of information, but unluckily not at all critical. (G. SA.)

See vol xxi, Plate VIII

STAFFORD, an inland county of England, is bounded on the S.E. by Warwickshire, S. by Worcestershire, W. by Shropshire, N.W. by Cheshire, and E. by Derbyshire, just touching Leicestershire. It is of irregular outline, and has been likened to an elongated and compressed pear, somewhat tapering at both ends. Its greatest length from north to south is 53 miles, and its greatest breadth is 35 miles. The area is 748,433 acres—about 1170 square miles.

Surface and Geology.—Although the general aspect of the county is that of a plain, it has been pronounced "rather a subalpine or hilly district", but its highest hill, Axe Edge, is only 1756 feet above the level of the sea. In the north the land is undulating and very picturesque, the hills here are the loftiest in the county, as Axe Edge, Cloud Thorpe, Mow Cop, and other hillocks and mounds called "edges." These are mostly composed of millstone grit. In the south we have sandstone, gravel, limestone, and basalt, represented respectively by Kinfare Edge, Barr and Cannock Chase, Sedgley, and Clent. The principal rivers are the Trent, the Tame, the Sow, the Penk, the Stour, the Blythe, the Tern, the Churnet, the Lyme, the Smestow, and the Manyfold, of these the Trent is the most important. The Severn has a short part of its course within the county, traversing the coal-field at Arley. The Dove separates Staffordshire from Derbyshire. Several of the rivers are well supplied with fish.

Geologically the county is included in the New Red Sandstone district of England, and is of the Carboniferous, Permian, and Triassic systems of formation. It is rich in limestone and coal. According to Mr Garner (*Natural History of the County of Stafford*), the following is a summary of its geological characters:—the Polley coal-field occupies 51 square miles, the South Staffordshire coal-field (excluding about 11 miles of it situated in other counties), 65, the Silurian limestone, &c., in the south of the county, 16, the Rowley basalt, 1, the Clent basalt, 2, the Arley coal field, basalt, cornstone, &c., 7, the mountain limestone, 40, the Cheadle coal-field, 18, the Chiddleton coal-field, 1, the Meerbrook coal-field, 4, the millstone grit, 100, the New Red Sandstone (marl, gravel, rock, sand, and peat), 825.

The county is very rich in fossils. In the coal, the limestone, and the Silurian deposits the remains of marine animals and plants are especially numerous. The museums in several towns have good collections of corals, calamites, and ferns, and probably the finest examples of trilobites and encrinites have been found in this part of England. The teeth of the *Megalichthys* have been found in the coal strata, and the Dudley museum contains a specimen of *M. hibberti*, nearly entire. The county is very rich in mineral productions. In a single year 12,000,000 tons of coal and 1,173,866 tons of iron have been obtained. The greatest quantity of iron is raised in the north and of coal in the south. Of the places at which the various products are found may be named—Birch Hills for anthracite coal, Hanley Green for peacock coal, Longton for cannel coal, Wednesbury for hæmatite iron ore, Langley Close for grey marble, the Rowley Hills for basalt. At Bilston casting sand, at Kingswinford fire-clay and fire bricks, at Tutbury alabaster, at Powke Hill black marble, and at Hemley Green red ochre are produced. In December 1885 an important discovery of coal was made near Dudley. Mr S. Blewitt has driven from the Grace Mary pits about 250 yards towards the Ivy House estate, through the igneous rocks, and come upon a large area of the best hard coal, about thirty feet in thickness, and some thirty acres in area.

Climate and Agriculture.—As regards climate the county shares the characteristics common to the midland district of England. Agriculture, though not its distinctive feature, forms a very important item in the industry and wealth of Staffordshire. The returns for 1886 furnish the following report:—in corn crops there were 94,273 acres, roots, artificial grasses, &c., 43,343, clover and grasses, 46,832, permanent pasture, 412,566, fallow, 7203, orchards, 1188, market gardens, 866, nursery grounds, 233, woods and plantations, 34,911. From the same returns we learn that the number of horses employed in agriculture was 16,031, unbroken horses and brood mares, 7802, cows in milk or in calf, 74,868, cattle under two years old, 56,224, two years and upward, 25,922, one-year-old sheep, 142,955, sheep under one year, 106,950, and pigs, 48,569. The total number of proprietors in the county was returned in 1873 as 43,371, possessing 638,084 acres, producing an annual rental of £3,630,254. The estimated extent of waste or common land was 7809 acres. Of the owners 33,672 owned less than one acre each. Eight proprietors were owners of more than 10,000 acres each, viz., Earl of Lichfield, 21,433, Earl of Shrewsbury, 18,954, Lord Hatherton, 14,901, Marquis of Anglesey, 14,344, Sir J. H. Crewe, 14,256, Duke of Sutherland, 12,744, Lord Bagot, 10,993, Sir T. F. F. Boughey, 10,505.

Manufactures.—The manufactures of Staffordshire are of a very varied character. Almost everything which is made of iron is manufactured in one town or another, and it would only be tedious to enumerate the almost infinite variety of goods produced. Wolverhampton and Willenhall are famous for locks, Cradley for nails, Oldbury for railway carriages, Walsall for spurs, bits, and saddlery, Tipton for anchors, Smethwick for glass, Soho for steam engines and hydraulic jacks, Wednesfield for keys, Bilston for tinplate wares, and Bloxwich for bits. Thanks to the labours of Josiah Wedgwood and Flaxman, the pottery work of Staffordshire ranks among the most famous manufactures of the kingdom, and Etruria is a household word wherever the admirable and artistic Wedgwood ware is known. The ale produced at Burton-on-Trent finds a market in almost every civilized country in the world, and in some that can scarcely be so described.

Communication.—The county is admirably provided with railways, canals, and tramways. The main roads are excellent, and are well maintained and kept in capital condition.

Administration and Population.—The population in 1861 was 746,943, in 1871 858,326, and in 1881 981,013 (males 492,009, females 489,004), an average of 1.31 persons to an acre. Staffordshire is in the Oxford circuit, and is nearly all in the diocese of Lichfield. The seat of the bishopric and the will courts are at Lichfield. The assize town is Stafford. There are five hundreds, each having two divisions:—North Totmonslow (Leek) and South Totmonslow (Cheadle), North Pirehill (Potteries) and South Pirehill (Stone), North Offlow (Burton-on-Trent) and South Offlow (Walsall), East Cuttlestone (Rugeley) and West Cuttlestone (Gnosall), North Seisdon (Sedgley) and South Seisdon (Kinfare). The county has one court of quarter sessions, and is divided into twenty-two petty and special sessional divisions, and there are 247 civil parishes and sixteen poor law unions. The municipal boroughs number twelve—Burslem, population 26,522, Burton-on-Trent (partly in Derbyshire), 39,288, Hanley, 48,361, Lichfield, 8349, Longton, 18,620, Newcastle under-Lyme, 17,508, Stafford, 19,977, Stoke-on-Trent, 19,261, Tamworth (partly in Warwickshire), 4891, Walsall 58,795, West Bromwich, 56,295, Wolverhampton, 75,766.

By the Redistribution of Seats Act, 1885, the parliamentary representation of Staffordshire was arranged as follows —seven boroughs each returning one member, one borough returning three, and seven county divisions with one member to each,—making seventeen members for the whole county The county divisions are named respectively Burton, Handsworth, Kingswinford, Leek, Lichfield, North-West, and West The following is a list of the boroughs, with populations given by or based on the census of 1881 —Wolverhampton (three members), 164,332, Hanley, 75,912, Newcastle-under-Lyme, 49,293, Stafford, 19,977, Stoke on-Trent, 64,091, Walsall, 59,402, Wednesbury, 68,142, West Bromwich, 56,295

History and Antiquities —Much antiquarian learning has been employed in showing that Staffordshire was in early ante-Roman days famous for the presence and power of the Druids Cannock Chase has been described as their headquarters in Britain, and Barr Beacon has been generally accepted as one of their principal places of worship, of which Drood or Druid Heath by its name still preserves the tradition At the time of Cæsar's arrival in the island this part of England was peopled by tribes whom the Roman authors designate as Cornavii or Carnabii The conquerors named the central part of the country, which included Staffordshire, Flavia Cæsariensis Two of their most famous roads, Watling Street and Ickmeld Street, passed through the county, —the first-named from Fazeley through Wall (*Etocetum*) to Wroxeter (*Uriconium*), and the Icknield Street through Birmingham to Wall, and by Burton-on Trent to Derby In Saxon times Staffordshire formed part of the great kingdom of Mercia, which was remarkable for the tenacity with which the people clung to their old faith and resisted the introduction of Christianity The new faith, however, prevailed over paganism and a cathedral was founded at Lichfield Through the influence of Offa, Pope Adrian in 786 made the see an independent archbishopric, but this honour was only possessed for a short period Mercia was frequently invaded by the Danes, and several battles were fought in Staffordshire, notably at Tettenhall and Wednesfield (Woden's Field), and a large number of Danes settled in this part So rapidly did they occupy the land that in 1016, when the Danish king Canute divided his conquests into four earldoms, Mercia was believed to have as many Danish as Saxon inhabitants After the Norman Conquest the county was divided among the Conqueror's retainers, the barons De Toni, De Montgomery, Fitz-Ansculf, and De Ferrers coming in for the lion's share Of after historical events the most noted are the defeat and execution of the earl of Lancaster by Edward II in 1322, and the battle at Blore Heath in 1459, in which the Yorkists were victorious over the Lancastrians During the Civil War Lichfield cathedral was besieged in 1643, and Lord Brook was killed by a shot fired from the battlements of the great tower Mary queen of Scots was imprisoned in Tutbury Castle from 1569 to 1572 In 1745, Charles Edward, the Young Pretender, in his attempt to win the crown of England, penetrated as far as Leek

Early British remains exist in various parts of the county, and a large number of barrows have been opened in which human bones, urns, fibulæ, stone hammers, armlets, pins, pottery, and other articles have been found In the neighbourhood of Wetton no fewer than twenty-three barrows have been opened, and British ornaments have been found in Needwood Forest Several Roman camps also exist in different parts But of mediæval times the chief legacy is the cathedral at LICHFIELD (*q v*), one of the most beautiful in the kingdom Of other interesting places the most worthy of notice are Beaudesert, Bentley Hall, Chillington, Dudley Castle, Enville Hall, Ingestre, Stafford Castle, Tamworth Castle, Tixall, and Wrottesley Hall More modern mansions are Ilam Hall, Alton Towers, Shugborough, Patteshull, Keele Hall, and Trentham Of famous personages belonging to the county are John Dudley (duke of Northumberland), Cardinal Pole, Archbishop Sheldon, Col John Lane, General Harrison, Lord Anson, Earl St Vincent, Izaak Walton, Dr Samuel Johnson, David Garrick, Josiah Wedgwood, Miss Seward, Mary Howitt

See Plot, *Natural History of Staffordshire*, 1686, Erdeswick, *Survey of Staffordshire*, 1717, Shaw, *History and Antiquities of Staffordshire*, 1798–1801, Pitt, *Topographical History of Staffordshire*, 1817, Garner, *Natural History of the County of Stafford*, 1844, Langford, *Staffordshire and Warwickshire*, 1874, and the publications of the Salt Archæological Society

STAFFORD, a parliamentary and municipal borough of England, and the county town of Staffordshire, is situated on the left bank of the river Sow, almost in the heart of England It is 123 miles from London and 29¼ from Birmingham, and is in the southern division of the hundred of Pirehill The principal trades of the town are tanning and the manufacture of boots and shoes, more especially for ladies The oldest church is that of St Chad, said to be originally of Saxon origin It was formerly a large and beautiful church, with chancel, nave, aisles, transepts, and a central tower, but has suffered severely from time, neglect, and rough treatment Restoration was begun in 1855, and the operations led to the discovery of some fine interlacing Norman arches and a beautiful Norman archway with some rich sculptured work between the nave and tower These were restored in 1856 and a new roof was put on the chancel in memory of Izaak Walton In 1874, the nave, arcades, and open-timbered roof were restored in memory of Mr Thomas Salt, in 1874–75 the south aisle was rebuilt, and in 1884–85 the tower The finest of the churches in Stafford is undoubtedly St Mary's, which was admirably restored in 1844–45 by Sir Gilbert Scott, at a cost of £30,000 It contains some good monuments, and several very fine memorial windows of stained glass Other churches worthy of mention are Christ Church, St Paul's, and St Thomas's The grammar school is a very old foundation, enlarged by Edward VI, the present building was erected in 1862 The free library was opened in 1882, and is now fairly well supplied with books The William Salt library contains a unique collection of books, deeds, autographs, engravings, and drawings relating to the county, collected by Mr Salt and presented by his widow It contains some 7000 volumes, between 2000 and 3000 deeds, and more than 9000 drawings, autographs, and valuable MSS, mostly relating to the history, topography, &c, of the county The town also possesses a good museum, collected principally by Mr Clement L Wragge, and called by his name, specially interesting is its almost perfect collection of fossils Stafford also contains a good school of art and a mechanics' institute Other prominent buildings are the shire hall, in which the assizes and quarter sessions are held, and the borough hall, the latter contains the municipal offices, and also has a large hall for public meetings Stafford is well supplied with charitable institutions, among which may be mentioned the general infirmary, built in 1766, the county lunatic asylum in 1818, and the Coton Hill institution for the insane in 1854, beautifully situated on rising ground, which commands extensive views of some of the loveliest country in the county, while its own grounds are tastefully laid out The householders of Stafford formerly possessed the right of using some very extensive common land situated north of the town, in 1880, however, all that remained (134 acres) was enclosed, and is now held for the people by a committee of householders elected annually A part of this land, called Stone Flat, is preserved as a public recreation ground Of another common named Coton Field, consisting of about 180 acres, 70 acres were in 1884 transferred absolutely to the freemen, and have been divided into 401 garden allotments, which are let at a small rental to resident freemen or their widows The parliamentary borough (area 774 acres, with population of 18,904 in 1881) was extended in 1885, and is now identical with the municipal borough The area of this is 1012 acres, and the population, 14,437 in 1871, was in 1881 19,977 The Act of 1885 reduced the parliamentary representation from two members to one

Stafford was of considerable importance before the Conquest The site was at first known as Bertelney or Betheney, from the island on which the earliest houses were built As the town grew its name was changed into that of Statford or Stadford In 913 Ethelfleda, sister of Edward the Elder, erected a fortification here, generally called a castle, but doubtless one of those defensive mounds which from their admirable positions were afterwards selected by the Normans as the sites of their castles and strongholds About a year and a half afterwards Edward the Elder built a tower, with walls and a fosse round it Pennant says this was on the mount called Castle Hill by Speed Stafford is mentioned in Domesday as a city paying £9 in customs There were 18 royal burgesses, and the earls of Mercia possessed twenty mansions The number of houses entered is 178 William built a castle on the old site, of which he appointed Robert de Toni

governor, who took the name De Stafford from that of the town, and was the originator of the great family of the Staffords. At this time it contained a royal mint; some of the coins are still extant, bearing on the obverse the head and name of the king, and on the reverse "Godwinne on Staef." Godwinne was the "king's moneyer." The castle of Robert de Toni was rebuilt by Ralph de Stafford in the reign of Edward III.; during the Civil War it was held for the Royalists by the earl of Northampton, but was taken for the Parliament by Sir William Brereton in May 1643. The castle was soon afterwards demolished by order of the Parliament. When fortified, Stafford had four gates. That on the south, near the river bridge, called the Green gate, was taken down in 1780. The arch of the East gate was standing a few years ago. The Gaol-gate was in ruins in 1680. The site of the fourth gate is unknown. King John confirmed and enlarged the privileges granted by the old charter. This was again confirmed by Edward VI., and on August 6, 1575, Elizabeth visited the town. Stafford adopted the Local Government Act, 1858, on April 23, 1872; and in 1876 an Act was obtained for extending the borough boundaries. The corporation now consists of a mayor, eight aldermen, and twenty-four councillors.

STAG. See Deer.

STAHL, Georg Ernst (1660–1734), chemist, was born on 21st October 1660 at Ansbach, studied at Jena, and became court-physician to the duke of Weimar in 1687. In 1694 he was appointed professor of medicine in Halle and in 1716 physician to the king of Prussia. He died at Berlin on May 14, 1734. His *Theoria Medica Vera* appeared at Halle in 1707 (see Medicine, vol. xv. p. 812), and his *Experimenta et Observationes Chemicæ* at Berlin in 1731 (see Chemistry, vol. v. pp. 460–61).

STAIR, James Dalrymple, First Viscount (1619–1695), was born in May 1619 at Drummurchie in Ayrshire. He was descended from a family for several generations inclined to the principles of the Reformation, and had ancestors both on the father's and the mother's side amongst the Lollards of Kyle. His father James Dalrymple, laird of the small estate of Stair in Kyle, died when he was an infant; his mother, Janet Kennedy of Knockdaw, is described as "a woman of excellent spirit," who took care to have him well educated. From the grammar school at Mauchline he went in 1633 to the university of Glasgow, where he graduated in arts on July 26, 1637. Next year he went to Edinburgh, probably with the intention of studying law, but the troubles of the times then approaching a crisis led him to change his course, and we next find him serving in the earl of Glencairn's regiment in the war of the Covenant. What part he took in it is not certainly known, but he was in command of a troop when recalled in 1641 to compete for a regency (as a tutorship or professorship was then called) in the university of Glasgow. He was elected in March. Mathematics, logic, ethics, and politics were the chief subjects of his lectures, and a note-book on logic by one of his students has been preserved. His activity and skill in matters of college business were praised by his colleagues, who numbered amongst them some of the leading Covenanting divines, and his zeal in teaching was gratefully acknowledged by his students. After nearly seven years' service he resigned his regency, and removed to Edinburgh, where he was admitted to the bar on February 17, 1648. This step had probably been rendered easier by his marriage four years before to Margaret Ross, co-heiress of Balneil in Wigtown. Stair's practice at the bar does not appear to have been large; his talents lay rather in the direction of learning and business than of oratory or advocacy. His reputation and the confidence reposed in him were shown by his appointment in 1649 as secretary to the commission sent to The Hague to treat with Charles II. by the parliament of Scotland. The negotiation having been broken off through the unwillingness of the young king to accept the terms of the Covenanters, Stair was again sent in the following year to Breda, where the failure of Montrose's expedition forced Charles to change his attitude, and to return to Scotland as the covenanted king. Stair had preceded him, and met him on his landing in Aberdeenshire, probably carrying with him the news of the execution of Montrose, which he had witnessed.

During the Commonwealth Stair continued to practise at the bar; but like most of his brethren he refused in 1654 to take the oath of allegiance to the Commonwealth and abjuration of royalty. Three years later, on the death of Lord Balcomie, Stair was appointed one of the commissioners for the administration of justice in Scotland on the recommendation of Monk. His appointment to the bench on 1st July 1657 by Monk was confirmed by Cromwell on the 26th. Stair's association with the English judges at this time must have enlarged his acquaintance with English law, as his travels had extended his knowledge of the civil law and the modern European systems which followed it. He thus acquired a singular advantage when he came to write on law, regarding it from a cosmopolitan or international rather than a merely local or national point of view. His actual discharge of judicial duty at this time was short, for after the death of Cromwell the courts in Scotland were shut,—a new commission issued in 1660 not having taken effect, it being uncertain in whose name the commission ought to run. It was during this period that Stair became intimate with Monk, who is said to have been advised by him when he left Scotland to call a full and free parliament. Soon after the Restoration Stair went to London, where he was received with favour by Charles, knighted, and included in the new nomination of judges in the Court of Session on 13th February 1661. He was also put on various important commissions, busied himself with local and agricultural affairs, and, like most of the Scottish judges of this and the following century, acted with zest and credit the part of a good country gentleman.

In 1662 he was one of the judges who refused to take the declaration that the National Covenant and the Solemn League and Covenant were unlawful oaths, and, forestalling the deposition which had been threatened as the penalty of continued non-compliance, he placed his resignation in the king's hands. The king, however, summoned him to London, and allowed him to take the declaration under an implied reservation. The next five years of Stair's life were comparatively uneventful, but in 1669 a family calamity, the exact facts of which will probably never be ascertained, overtook him. His daughter Janet, who had been betrothed to Lord Rutherfurd, was married to Dunbar of Baldoon, and some tragic incident occurred on the wedding night, from the effects of which she never recovered. As the traditions vary on the central fact, whether it was the bride who stabbed her husband, or the husband who stabbed the bride, no credence can be given to the mass of superstitions and spiteful slander which surrounded it, principally levelled at Lady Stair. In 1670 Stair served as one of the Scottish commissioners who went to London to treat of the Union; but the project, not seriously pressed by Charles and his ministers, broke down through a claim on the part of the Scots to what was deemed an excessive representation in the British parliament. In January 1671 Stair was appointed president of the Court of Session. In the following year, and again in 1673, he was returned to parliament for Wigtownshire, and took part in the important legislation of those years in the department of private law. During the bad time of Lauderdale's government Stair used his influence in the privy council and with Lauderdale to mitigate the severity of the orders passed against ecclesiastical offenders, but for the most part he abstained from attending a board whose policy he could not approve. In 1679 he went to London to defend the court against charges of partiality and injustice which had been made against it, and was

thanked by his brethren for his success When in the following year the duke of York came to Scotland, Stair distinguished himself by a bold speech, in which he congratulated the duke on his coming amongst a nation which was entirely Protestant This speech can have been little relished, and the duke was henceforth his implacable enemy His influence prevented Stair from being made chancellor in 1681, on the death of the duke of Rothes

The parliament of this year, in which Stair again sat, was memorable for two statutes, one in private and the other in public law The former, relating to the testing of deeds, was drawn by Stair, and is sometimes called by his name Although it is susceptible of some improvement, the two centuries during which it has regulated this important branch of practical conveyancing is a testimony to the skill of the draftsman The other was the infamous Test Act, probably the worst of the many measures devised at this period with the object of fettering the conscience by oaths Stair also had a minor share in the form which this law finally took, but it was confined to the insertion of a definition of "the Protestant religion", by this he hoped to make the test harmless, but his expectation was disappointed, and the form in which it emerged from parliament was such that no honest man could take it Yet, self-contradictory and absurd as it was, the Test Act was at once rigidly enforced Argyll, who declared he took it only in so far as it was consistent with itself and the Protestant religion, was tried and condemned for treason, and narrowly saved his life by escaping from Edinburgh Castle the day before that fixed for his execution Stair, dreading a similar fate, went to London to seek a personal interview with the king, who had more than once befriended him, perhaps remembering his services in Holland, but the duke of York intercepted his access to the royal ear, and when he returned to Scotland he found a new commission of judges issued, from which his name was omitted He retired to his wife's estate in Galloway, and occupied himself with preparing for the press his great work, *The Institutions of the Law of Scotland*, which he published in the autumn of 1681, with a dedication to the king

He was not, however, allowed to pursue his legal studies in peaceful retirement His wife was charged with attending conventicles, his factor and tenants severely fined, and he was himself not safe from prosecution at any moment A fierce dispute arose between Claverhouse and his son, the master of Stair, relative to the regality of Glenluce, and, both having appealed to the privy council, Claverhouse, as might have been expected, was absolved from all the charges brought against him, and the master was deprived of the regality Stair had still powerful friends, but his opponents were more powerful, and he received advice to quit the country He repaired to Holland in October 1684, took up his residence, along with his wife, some of his younger children, and his grandchild, afterwards the field-marshal Stair, at Leyden While there he published the *Decisions of the Court of Session between 1666 and 1671*, of which he had kept a daily record, and a small treatise on natural philosophy, entitled *Physiologia Nova Experimentalis*

In his absence a prosecution for treason was raised against him and others of the exiles by Sir G Mackenzie, the lord advocate He was charged with accession to the rebellion of 1679, the Ryehouse plot, and the expedition of Argyll With the first two he had no connexion, with Argyll's unfortunate attempt he had no doubt sympathized, but the only proof of his complicity was slight, and was obtained by torture The proceedings against him were never brought to an issue, having been continued by successive adjournments until 1687, when they were dropped The cause of their abandonment was the appointment of his son, the master of Stair, who had made his peace with James II, as lord advocate in room of Mackenzie, who was dismissed from office for refusing to relax the penal laws against the Catholics The master only held office as lord advocate for a year, when he was "degraded to be justice clerk"—the king and his advisers finding him not a fit tool for their purpose Stair remained in Holland till the following year, when he returned under happier auspices in the suite of William of Orange William, who had made his acquaintance through the pensionary Fagel, was ever afterwards the firm friend of Stair and his family The master was made lord advocate, and, on the murder of President Lockhart in the following year, Stair was again placed at the head of the Court of Session An unscrupulous opposition, headed by Montgomery of Skelmorlie, who coveted the office of secretary for Scotland, and Lord Ross, who aimed at the presidency of the court, sprang up in the Scottish parliament, and an anonymous pamphleteer, perhaps Montgomery himself or Ferguson the Plotter, attacked Stair in a pamphlet entitled *The Late Proceedings of the Parliament of Scotland Stated and Vindicated* He defended himself by publishing an *Apology*, which, in the opinion of impartial judges, was a complete vindication Shortly after its issue he was created Viscount Stair He had now reached the summit of his prosperity, and the few years which remained of his old age were saddened by private and public cares In 1692 he lost his wife, the faithful partner of his good and evil fortune for nearly fifty years The massacre of Glencoe, which has marked the master of Stair with a stain which his great services to the state cannot efface,—for he was undoubtedly the principal adviser of William in that treacherous and cruel deed,—was used as an opportunity by his adversaries of renewing their attack on the old president His own share in the crime was remote, it was alleged that he had as a privy councillor declined to receive Glencoe's oath of allegiance, though tendered, on the technical ground that it was emitted after the day fixed, but even this was not clearly proved But some share of the odium which attached to his son was naturally reflected on him Other grounds of complaint were not difficult to make up, which found willing supporters in the opposition members of parliament A disappointed suitor brought in a bill in 1693 complaining of his partiality He was also accused of domineering over the other judges and of favouring the clients of his sons Two bills were introduced without naming him but really aimed at him,—one to disqualify peers from being judges and the other to confer on the crown a power to appoint temporary presidents of the court The complaint against him was remitted to a committee, which after full inquiry completely exculpated him, and the two bills, whose incompetency he demonstrated in an able paper addressed to the commission and parliament, were allowed to drop He was also one of a parliamentary commission which prepared a report on the regulation of the judicatures, afterwards made the basis of a statute in 1695 supplementary to that of 1672, and forming the foundation of the judicial procedure in the Scottish courts down to the present century On November 29, 1695, Stair, who had been for some time in failing health, died in Edinburgh, and was buried in the church of St Giles

In the same year there was published in London a small volume with the title *A Vindication of the Divine Perfections, Illustrating the Glory of God in them by Reason and Revelation, methodically digested,—By a Person of Honour* It was edited by the two Nonconformist divines, William Bates and John Howe, who had been in exile in Holland along with Stair, and is undoubtedly his work Perhaps it had been a sketch of the "Inquiry Concerning Natural Theology" which he had contemplated writing in 1681.

It is of no value as a theological work, for Stair was no more a theologian than he was a man of science, but it is of interest as showing the serious bent of his thoughts and the genuine piety of his character.

It is as a legal writer and a judge that he holds a pre-eminent place amongst many distinguished countrymen belonging to his profession. The full title of his great work, which runs as follows—*The Institutions of the Law of Scotland, deduced from its Originals, and collated with the Civil, Canon, and Feudal Laws and with the Customs of Neighbouring Nations*—is fully borne out by the contents, and affords evidence of the advantage Stair had enjoyed from his philosophical training, his foreign travels, and his intercourse with Continental jurists as well as English lawyers. It is no narrow technical treatise, but a comprehensive view of jurisprudence as based on philosophical principles and derived from a Divine Author. But neither does it lose itself in generalities, for it is the work of a lawyer and judge intimately acquainted with every detail in the practical application of law in his native country. Unfortunately for its permanent fame and use, much of the law elucidated in it has now become antiquated through the decay of the feudal part of Scottish law and the large introduction of English law, especially in the departments of commercial law and equity. But its spirit still animates Scottish law and educates Scottish lawyers, and it may be hoped will continue to do so, saving them from being the slaves of precedent or the victims of the utilitarian philosophy which regards all positive law as conventional and destitute of necessary principles derived from the nature of the world and man.

The *Physiologia* was favourably noticed by Boyle, and is interesting as showing the activity of mind of the exiled judge, who returned to the studies of his youth with fresh zest when physical science was approaching its new birth. But he was not able to emancipate himself from formulæ which had cramped the education of his generation, and had not caught the light which Newton spread at this very time by the communication of his *Principia* to the Royal Society of London.

Stair was fortunate in his descendants. "The family of Dalrymple," observes Sir Walter Scott, "produced within two centuries as many men of talent, civil and military, of literary, political, and professional eminence, as any house in Scotland." His five sons were all remarkable in their professions. The master of Stair, who became the first earl, was an able lawyer, but still abler politician. Sir James Dalrymple of Borthwick, one of the principal clerks of session, was a very thorough and accurate historical antiquary. Sir Hew Dalrymple of North Berwick succeeded his father as president, and was reckoned one of the best lawyers and speakers of his time. Thomas Dalrymple became physician to Queen Anne. Sir David Dalrymple of Hailes was lord advocate under Anne and George I. Stair's grandson the field-marshal and second earl gained equal credit in war and diplomacy. His great-grandson Sir David Dalrymple, Lord Hailes, also rose to the bench, where he had an honourable character for learning as a civil and humanity as a criminal judge. But his literary exceeded his legal fame. As an honest and impartial historian he laid the foundations of the true narrative of Scottish history, from which all his successors have largely borrowed.

For a fuller account of the life of Stair, see *Annals of the Viscount and First and Second Earls of Stair*, by J. Murray Graham, and *Memoir of Sir James Dalrymple, First Viscount Stair*, 1875, by Æ. J. G. Mackay. (Æ. M.)

STALYBRIDGE, a municipal and parliamentary borough of England, partly in Lancashire but principally in Cheshire, is situated on the Tame, 1 mile east of Ashton-under-Lyne, and 7½ east of Manchester. The Tame is crossed by bridges connecting the counties of Chester and Lancaster. The principal public buildings are the town-hall (1831), the Foresters' hall (1836) the district infirmary, the mechanics' institute (1861), the people's institute (1864), the market-hall (1866), and the Oddfellows' hall (1878). Stamford park, extending to about 60 acres, and lying between Stalybridge and Ashton, was opened 12th July 1873. The town is one of the oldest seats of the cotton manufacture, the first cotton mill having been erected in 1776 and the first steam engine in 1795. In addition to extensive cotton mills, it possesses woollen factories, iron and brass foundries, machine works, nail works, and paper mills. Stalybridge was created a market town in 1828, was incorporated as a municipal borough in 1857, and obtained the privilege of returning a member to parliament in 1867. The municipal borough (area 806 acres) had a population of 21,092 in 1871, and 22,785 in 1881; its limits were extended in 1881 to 3120 acres, with a population of 25,977. The population of the parliamentary borough (area 2214 acres) in 1871 was 35,114 and in 1881 it was 39,671. The area added to the municipal borough in 1881 was in 1885 included in the parliamentary borough also,—the population of this extended area being 42,863 at the census of 1881.

STAMFORD, a municipal borough and market-town, chiefly in Lincolnshire but partly in Northamptonshire, is situated on the river Welland, and on branches of the Midland, the London and North Western, and the Great Northern railway lines, 89 miles north of London and 55 south of Lincoln. The ancient bridge over the Welland was in 1849 superseded by a new structure of stone, erected at a cost of £8500. The town formerly possessed fourteen parish churches, but now has only six, viz., St Mary's, erected at the end of the 13th century, possessing an Early English tower, with Decorated spire, the principal other parts of the building being Perpendicular; All Saints, also of the 13th century, the steeple being built at the expense of John Brown, merchant of the staple at Calais, in the beginning of the 15th century; St Michael's, rebuilt in 1836 on the site of one erected in 1269; St George's, Early English, Decorated, and Perpendicular, for the most part rebuilt in 1450 at the expense of William Bruges, first garter king-at-arms; St John Baptist's, Perpendicular, erected about 1452; and St Martin's, Perpendicular, in which Lord Treasurer Burghley is buried. Formerly there were several religious houses:—the Benedictine monastery of St Leonard's, founded in the 7th century, of which there are still some remains; the Carmelite monastery (1291), of which the west gate still stands; and houses for grey friars (time of Henry III.), Dominicans (1240), Gilbertines (1291), and Augustinians (1316). The principal secular buildings are the town-hall (rebuilt 1776), the corn exchange (1859), and the literary and scientific institute (1842), with a library of 6000 volumes. There are a large number of charitable institutions, including the Stamford and Rutland infirmary (1828), Browne's hospital, founded in the time of Richard III., Snowden's almshouses (1604), Truesdale's almshouses (1700), and Burghley hospital, founded by Lord Treasurer Burghley (1597). Ratcliffe's and Browne's high school for boys was lately erected at a cost of £7000 on the site of Ratcliffe's free school, and Brown's school for girls in St Martin's was erected in 1876 at a cost of £5000. The prosperity of the town depends chiefly on its connexion with agriculture. It possesses iron foundries, agricultural implement works, waggon factories, and breweries. There is also some trade in coal, timber, stones, and slates. The population of the municipal borough (area 1766 acres) in 1871 was 7846 and in 1881 it was 8773; that of the parliamentary borough (area 1894 acres) in the same years was 8086 and 8993. The latter was merged in the counties in 1885, giving its name to a parliamentary division of Lincolnshire.

The town is of very remote antiquity, and is supposed to have grown into importance after the decay of the Roman village of Bridge Casterton two miles distant. Its name, an early form of which was Staenford, was derived from a passage at the town across the Welland by stone. It was the scene of the first battle of the Picts and Scots against the Britons and Saxons in 449, and subsequently became one of the five great Danish boroughs. A castle was built early in the 10th century on the south bank of the river opposite the town, but has long disappeared; and of another on the north-west of the town, fortified by Stephen, only the foundations now remain. The town was at one time enclosed by walls, and there are still traces of gateways on the east and west sides. In the reign of Henry III. the lectures of the Carmelites on divinity and the liberal arts led to the erection of colleges, and Stamford became celebrated as a place of education. When dissensions arose among the students of Oxford in the reign of Edward III. many removed thither, and ultimately the universities both of Oxford and Cambridge thought it necessary to pass statutes prohibiting their students from proceeding to other places for any part of their education, Stamford being specially mentioned in the

Oxford statute At the time of the Conquest Stamford was governed by aldermen It was incorporated by charter in the reign of Edward IV In 1663 it received a charter from Charles II, constituting its chief magistrate a mayor It returned two members to parliament from the reign of Edward I till 1867, and one from 1867 to 1885 The deanery of Stamford is an ancient peculiar, the appointment being vested in the bishop of Lincoln

STAMFORD, a borough of the United States, in Fairfield county, Connecticut, is situated on Long Island Sound, 35 miles north-east of New York city, on the New York, New Haven, and Hartford Railroad It has a small harbour accessible to steamboats by means of a canal, and among its public buildings are the town-hall and several handsome churches Locks, carriages, stoves, fire-bricks, edge-tools, cranes, hardware, hosiery, and especially logwood extract and liquorice are manufactured in the borough The population was 9714 in 1870 and 11,297 in 1880

STAMMERING, or STUTTERING, designates a spasmodic affection of the organs of speech in which the articulation of words is suddenly checked and a pause ensues, often followed by a repetition in rapid sequence of the particular sound at which the stoppage occurred Of this painful affection there are many grades, from a slight inability to pronounce with ease certain letters or syllables, or a tendency to hesitate and to interject unmeaning sounds in a spoken sentence, to the more severe condition in which there is a paroxysm of spasms of the muscles, not only of the tongue and throat and face, but even of those of respiration and of the body generally To understand in some degree the explanation of stammering it is necessary to consider shortly the physiological mechanism of articulate speech Speech is the result of various muscular movements affecting the current of air as it passes in expiration from the larynx through the mouth If the vocal cords are called into action, and the sounds thus produced are modified by the muscular movements of the tongue, cheeks, and lips, we have vocal speech, but if the glottis is widely open and the vocal cords relaxed the current of air may still be moulded by the muscular apparatus so as to produce speech without voice, or whispering (see VOICE) In both cases, however, the mechanism is very complicated, requiring a series of nervous and muscular actions, all of which must be executed with precision and in accordance In vocal speech, for example, it is necessary that the respiratory movements, more especially those of expiration, occur regularly and with nice adjustment to the kind of articulate expression required, that the vocal cords be approximated and tightened by the muscles of the larynx acting with delicate precision, so as to produce the sound of the pitch desired, that the *rima glottidis* (or aperture of the larynx) be opened so as to produce prolonged sounds, or suddenly closed so as to cut off the current of air, that the movements of the muscles of the tongue, of the soft palate, of the jaws, of the cheeks, and of the lips occur precisely at the right time and to the requisite extent, and finally that all of these muscular adjustments take place with rapidity and smoothness, gliding into each other without effort and without loss of time Exquisite co-ordination of muscular movement is therefore necessary, involving also complicated nervous actions Hence is it that speech is acquired by long and laborious effort A child possesses voice from the beginning, it is born with the capacity for speech, but articulate expression is the result of education In infancy, not only is knowledge acquired of external objects, and signs attached in the form of words to the ideas thus awakened, but the nervous and muscular mechanisms by which these signs or words receive vocal expression are trained by long practice to work harmoniously

It is not surprising, therefore, that in certain cases, owing to some obscure congenital defect, the co ordination is not effected with sufficient precision, and that stammering is the result Even in severe cases no appreciable lesion can be detected either in the nervous or muscular mechanisms, and the condition is similar to what may affect all varieties of finely co-ordinated movements The mechanism does not work smoothly, but the pathologist is unable to show any organic defect Thus the co ordinated movements necessary in writing are disturbed in scrivener's palsy, and the skilful performer on the piano or on any instrument requiring minute manipulation may find that he is losing the power of delicate adjustment Stammering is occasionally hereditary It rarely shows itself before the age of four or five years, and as a rule it is developed between this age and puberty Men stammer in a much larger proportion than women It may occur during the course of nervous affections, such as hysteria, epilepsy, or tabes dorsalis, sometimes it follows febrile disorders, often it develops in a child in a feeble state of health, without any special disease In some cases a child may imitate a stammerer and thus acquire the habit Any general enfeeblement of the health, and especially nervous excitement, aggravates the condition of a confirmed stammerer

Stammerers, as a rule, find the explosive consonants *b*, *p*, *d*, *t*, *k*, and hard *g* the most difficult to articulate, but many also are unable easily to deal with the more continuous consonants, such as *v*, *f*, *th*, *s*, *z*, *sh*, *m*, *n*, *y*, and in severe cases even the vowels may cause a certain amount of spasm Usually the defect is not observed in whispering or singing, but there are exceptions to this statement In pronouncing the explosive sounds the part of the oral apparatus that ought suddenly to open or close remains spasmodically closed, and the stammerer remains for a moment voiceless or strives pitifully to overcome the obstruction, uttering a few successive puffs or sounds like the beginning of the sound he wishes to utter The lips thus remain closed at the attempted utterance of *b* and *p*, the tip of the tongue is pressed against the hard palate or the back of the upper front teeth in *d* and *t*, and the back of the tongue presses against the posterior part of the palate in pronouncing *g* hard and *k* In attempting the continuous consonants, in which naturally the passage is not completely obstructed, the stammerer does not close the passage spasmodically, but the parts become fixed in the half-opened condition, or there are intermittent attempts to open or close them, causing either a drawling sound or coming to a full stop In severe cases, where even vowels cannot be freely uttered, the spasm appears to be at the *rima glottidis* (opening of the larynx) Again, in some cases, the spasm may affect the respiratory muscles, giving rise to a curious barking articulation, in consequence of spasm of the expiratory muscles, and in such cases the patient utters the first part of the sentence slowly, gradually accelerates the speed, and makes a rush towards the close In the great majority of cases the spasm affects the muscles of articulation proper, that is, those of the pharynx, tongue, cheeks, and lips In the most aggravated cases the condition of the patient is pitiable It has thus been well described by Dr Bristow in an article full of interesting details —

"The most distressing cases are those in which the spasm extends to parts unconnected with speech,—it may be to nearly the whole muscular organism In such a case the spasm commences, let us assume, at the base of the tongue, the mouth opens widely and remains in that position, the muscles of expiration work convulsively, the glottis contracts, respiration becomes arrested, the face becomes congested and the veins dilated, violent spasmodic movements involve the trunk and limbs, and only after some time, either when the patient becomes exhausted, or when he resolutely restrains his attempts to articulate, does his paroxysm come to an end"—*Quain's Dictionary of Medicine*, p 1513

Such a case is not common; it is more paroxysmal than habitual, and in ordinary conversation, when the patient is free from nervous excitement, the defect may be scarcely observed. A condition named *aphthongia* is even more distressing. It totally prevents speech, and may, at intervals, come on when the person attempts to speak; but fortunately it is only of temporary duration, and is usually caused by exceptional nervous excitement. It is characterized by spasm of the muscles supplied by the hypoglossal nerve, including the sterno-hyoid, sterno-thyroid, and thyro-hyoid muscles. In almost all cases of stuttering it is noticed that the defect is most apparent when the person is obliged to make a sudden transition from one class of sounds to another, and the patient soon discovers this for himself and chooses his words so as to avoid dangerous muscular combinations. When one considers the delicate nature of the adjustments necessary in articulate speech, this is what may be expected. It is well known that a quickly diffusible stimulant, such as alcohol, temporarily removes the difficulty in speech.

Stuttering may be successfully overcome in some cases by a careful process of education under a competent tutor. Not a few able public speakers were at first stutterers, but a prolonged course of vocal gymnastics has remedied the defect. The patient should be encouraged to read and speak slowly and deliberately, carefully pronouncing each syllable, and when he feels the tendency to stammer, he should be advised to pause for a short time, and then by a strong voluntary effort to attempt to pronounce the word. He should also be taught how to regulate respiration during speech, so that he may not fail from want of breath. In some cases aid may be obtained by raising the voice towards the close of the sentence. Sounds or combinations of sounds that present special difficulties should be made the subject of careful study, and the defect may be largely overcome by a series of graduated exercises in reading. The practice of intoning is useful in many cases. In ordinary conversation it is often important to have some one present who may by a look put the stammerer on his guard when he is observed to be talking too quickly or indistinctly. Thus by patience and determination many stammerers have so far overcome the defect that it can scarcely be noticed in conversation; but even in such cases mental excitement or slovenly inattention to the rules of speech suitable for the condition may cause a relapse. In very severe cases, where the spasmodic seizures affect other muscles than those of articulation, special medical treatment is necessary, as such are on the borderland of serious nervous disturbance. All measures tending to improve the general health, the removal of any affection of the mouth or gums that may aggravate habitual stammering, the avoidance of great emotional excitement, a steady determination to overcome the defect by voluntary control, and a system of education such as has been sketched will do much in the great majority of cases to remedy stammering. (J. G. M.)

STAMPS. The stamp duty is a tax imposed upon a great variety of legal and other documents, and forms a branch of the national revenue. The stamp is a cheap and convenient mode of certifying that the revenue regulations have been complied with. Stamp duties appear to have been invented by the Dutch in 1624. They were first imposed in England in 1694 by 5 and 6 Will. and Mary, c. 21, as a temporary means of raising funds for carrying on the war with France. They now depend upon a very large number of statutes, the principal one being the Stamp Act, 1870, 33 and 34 Vict. c. 97 (which extends to the United Kingdom). The amount of stamp duty varies from one halfpenny (postage) to thousands of pounds (probate or succession). It appears scarcely necessary in this place to set out at length the various stamp duties payable in the United Kingdom, inasmuch as those of the most usual occurrence will readily be found in ordinary books of reference.

Stamp duties are either fixed, such as the duty of one penny on every cheque irrespective of its amount, or *ad valorem*, as the duty on a conveyance, which varies according to the amount of the purchase money. The duty is denoted generally by an impressed, less frequently by an adhesive, stamp, sometimes by either at the option of the person stamping. Thus an inland bill of exchange (unless payable on demand) must have an impressed stamp, a foreign bill of exchange an adhesive stamp, while an agreement or receipt stamp may be of either kind. It should be noticed that certain documents falling within a class which as a rule is subject to stamp duty are for reasons of public policy or encouragement of trade exempted from the duty by special legislation. Examples of such documents are Bank of England notes, agreements within § 17 (but not those within § 4) of the Statute of Frauds (see FRAUD), agreements between a master of a ship and his crew, transfers of ships or shares in ships, indentures of apprenticeship for the sea service, petitions forwarded by post to the crown or a House of Parliament, and most instruments relating to the business of building and friendly societies.

As a general rule a document must be stamped at the time of execution, or a penalty (remissible by the commissioners of inland revenue) is incurred. The penalty is in most cases £10, sometimes much more; in the case of policies of marine insurance it is £100. Some instruments cannot be stamped at all after execution, even with payment of the penalty. Such are bills of exchange and promissory notes (where an impressed stamp is necessary), bills of lading, proxies for voting at meetings of proprietors of joint-stock companies, and receipts after a month from date. An unstamped instrument cannot be pleaded or given in evidence except in criminal proceedings or for a collateral purpose. If an instrument chargeable with duty be produced as evidence in a court, the officer whose duty it is to read the instrument is to call the attention of the judge to any omission or insufficiency of the stamp, and if the instrument is one which may legally be stamped after execution, it may, on payment of the amount of the unpaid duty and the penalty payable by law, and a further sum of £1, be received in evidence, saving all just exceptions on other grounds. The rules of the Supreme Court, 1883 (Ord. xxxix. r. 8, re-enacting a provision of the Common Law Procedure Act), provide that a new trial is not to be granted by reason of the ruling of a judge that the stamp upon any document is sufficient or that the document does not require a stamp. The stamp upon a document subject to the stamp laws of a foreign state is usually admissible in evidence in a court of the United Kingdom if it conform in other respects to the rules governing the admissibility of such documents, even though it be improperly stamped according to the law of the foreign country. The admissibility of documents belongs to the *ordinatoria litis* rather than the *decisoria litis*, and is governed by the *lex fori* rather than the *lex loci contractus*, unless indeed that law makes a stamp necessary to the validity of the instrument. As to bills of exchange, the Bills of Exchange Act, 1882, 45 and 46 Vict. c. 61, § 72, provides that where a bill is issued out of the United Kingdom it is not invalid by reason only that it is not stamped in accordance with the law of the place of issue, and that where a bill issued out of the United Kingdom conforms as regards requisites in form to the law of the United Kingdom it may for the purpose of enforcing payment thereof be treated as valid as between all persons who negotiate, hold, or become parties to it in the United Kingdom.

By the Stamp Duties Management Act, 1870, 33 and 34 Vict. c. 98, the stamp duties are put under the management of the commissioners of inland revenue, who are empowered to grant licences to deal in stamps, and to make allowance for spoiled or misused stamps. Certain offences, such as forging a die or stamp, selling or using a forged stamp, &c., are made felonies punishable with penal servitude for life as a maximum.

United States.—The subject of stamp duties is of unusual historical interest, as the passing of Grenville's Stamp Act of 1765 (5 Geo. III. c. 12) directly led to the American revolution. The Act was, indeed, repealed the next year as a matter of expediency by 6 Geo. III. c. 11, but 6 Geo. III. c. 12 declared the right of the British legislature to bind the colonies by its Acts. The actual yield of the stamp duties under the Act of 1765 was, owing to the opposition in the American colonies, only £4000—less than the expenses of putting the Act into force. The stamp duties of the United States are now under the superintendence of the commissioner of internal revenue. These duties, which depend upon a great body of statutory law, will be found in the Revised Statutes, tit. xxxv.

The principal authorities on the subject of this article are Tilsley, *Stamp Laws*, and Dowell, *Stamp Duties*.

STANDARDS. See WEIGHTS AND MEASURES.

STANFIELD, WILLIAM CLARKSON (1794–1867), marine painter, was born of Irish parentage at Sunderland in 1794. As a youth he was a sailor, and during many long voyages he acquired that intimate acquaintance with the sea and shipping which was admirably displayed in his subsequent works. In his spare time he diligently occupied himself in sketching marine subjects, and so much skill did he acquire that, after having been incapacitated by an accident from active service, he received an engagement, about 1818, to paint scenery for the "Old Royalty," a sailor's theatre in Wellclose Square, London. Along with David Roberts he was afterwards employed at the Coburg theatre, Lambeth; and in 1826 he became scene-painter to Drury Lane theatre, where he executed some admirable work, especially distinguishing himself by the production of a drop-scene, and by decorations for the Christmas pieces for which the house was celebrated. Meanwhile he had been at work upon some easel pictures of small dimensions, and was elected a member of the Society of British Artists. Encouraged by his success at the British Institution, where in 1827 he exhibited his first important picture—Wreckers off Fort Rouge—and in 1828 gained a premium of 50 guineas, he before 1830 abandoned scene-painting, and in that year made an extended tour on the Continent. He now produced his Mount St Michael, which ranks as one of his finest works; in 1832 he exhibited his Opening of New London Bridge and Portsmouth Harbour—commissions from William IV—in the Royal Academy, of which he was elected an associate in 1832 and an academician in 1835; and until his death on the 18th of May 1867 he contributed to its exhibitions a long series of powerful and highly popular works, dealing mainly with marine subjects, but occasionally with scenes of a more purely landscape character.

Among these may be named—the Battle of Trafalgar (1836), executed for the United Service Club; the Castle of Ischia (1841), Isola Bella (1841), among the results of a visit to Italy in 1839; French Troops Fording the Magra (1847), the "Victory" Bearing the Body of Nelson Towed into Gibraltar (1853), the Abandoned (1856). He also executed two notable series of Venetian subjects, one for the banqueting hall at Bowood, the other for Trentham. He was much employed on the illustrations for *The Picturesque Annual*, and published a collection of lithographic views on the Rhine, Moselle, and Meuse, and forty of his works were engraved in line under the title of "Stanfield's Coast Scenery." Four of his engraved pictures are in the National Gallery, and his works may also be studied in the South Kensington Museum. A large collection of his productions were included in the Royal Academy's Winter Exhibition for 1870. The whole course of Stanfield's art was powerfully influenced by his early practice as a scene-painter. But, though there is always a touch of the spectacular and the scenic in his works, and though their colour is apt to be rather dry and hard, they are large and effective in handling, powerful in their treatment of broad atmospheric effects, and telling in composition, and they evince the most complete knowledge of the artistic materials with which their painter deals.

STANHOPE, CHARLES STANHOPE, THIRD EARL (1753–1816), was born on 3d August 1753, and educated under the opposing influences of Eton and Geneva, devoting himself whilst resident in the Swiss city to the study of mathematics, and acquiring from the associations connected with Switzerland an intense love of liberty. He contested the representation of the city of Westminster without success in 1774, when only just of age; but from the general election of 1780 until his accession to the peerage on the 7th of March 1786 he represented through the influence of Lord Shelburne the Buckinghamshire borough of High Wycombe, and during the sessions of 1783 and 1784 he gave his support to the administration of William Pitt, whose sister Lady Hester Pitt he married on 19th December 1774. When Pitt ceased to be inspired by the Liberal principles of his early days, his brother-in-law severed their political connexion and opposed with all the impetuosity of his fiery heart the arbitrary measures which the ministry favoured. Lord Stanhope's character was without any taint of meanness, and his conduct was marked by a lofty consistency never influenced by any petty motives; but his speeches, able as they were, had no weight on the minds of his compeers in the upper chamber, and, from a disregard of their prejudices, too often drove them into the opposite lobby. He was the chairman of the "Revolution Society," founded in honour of the Revolution of 1688, the members of which in 1790 expressed their sympathy with the aims of the French republicans. He brought forward in 1794 the case of Muir, one of the Edinburgh politicians who were transported to Botany Bay, and in 1795 he introduced into the Lords a motion deprecating any interference with the internal affairs of France. In all of these points he was hopelessly beaten, and in the last of them he was in a "minority of one"—a sobriquet which stuck to him throughout life,—whereupon he seceded from parliamentary life for five years. The lean and awkward figure of Lord Stanhope figured in a host of the caricatures of Sayers and Gillray, reflecting on his political opinions and his personal relations with his children. His first wife died on 20th July 1780, and he married on 17th March 1781 Louisa, daughter and sole heiress of the Hon. Henry Grenville (governor of Barbados in 1746 and ambassador to the Porte in 1762), a younger brother of the first Earl Temple and George Grenville. Through his union with this lady, who survived until March 1829, he was doubly connected with the family of Grenville. By his first wife he had three daughters, one of whom was Lady Hester Stanhope (see below), and his second wife was the mother of three sons. Lord Stanhope died at the family seat of Chevening, Kent, on 15th December 1816.

Earl Stanhope was elected a fellow of the Royal Society so early as November 1772, and devoted a large part of his income to experiments in science and philosophy. He invented a method of securing buildings from fire (which, however, proved impracticable), the printing press and the lens which bear his name, and a monochord for tuning musical instruments, suggested improvements in canal locks, made experiments in steam navigation in 1795–97, and contrived two calculating machines. When he acquired an extensive property in Devonshire, he projected a canal through that county from the Bristol to the English Channel and took the levels himself. Electricity was another of the subjects which he studied, and the volume of *Principles of Electricity* which he issued in 1779 contained the rudiments of his theory on the "return stroke" resulting from the contact with the earth of the electric current of lightning, which were afterwards amplified in a contribution to the *Philosophical Transactions* for 1787. His principal labours in literature consisted of a reply to Burke's *Reflections on the French Revolution* (1790) and an *Essay* on the rights of juries (1792), and he long meditated the compilation of a digest of the statutes. His scientific theories, his mechanical experiments, and his studies in music absorbed all his thoughts, and for them he neglected his wives and his children. His youngest daughter, Lady Lucy Rachael Stanhope, eloped with Mr Thomas Taylor of Sevenoaks, the family apothecary, and her father refused to be reconciled to her, an inconsistency in a republican which subjected him to a caricature from Gillray. Lady Hester Stanhope abandoned her home and went to live with her mother's relations. Lord Stanhope's high qualities were marred by an impracticable disposition.

STANHOPE, LADY HESTER LUCY (1776–1839), the eldest child of the third Earl Stanhope (noticed above), by his first wife Lady Hester Pitt, eldest daughter of the first earl of Chatham, lived for the earlier part of her life amid the surroundings of a noble mansion, or in close communion with her uncle William Pitt, the most prominent minister of his age, and on his early death withdrew whilst still young to brood over the past in the solitudes of Palestine. She was born on 12th March 1776, and dwelt at her father's seat of Chevening in Kent until early in 1800, when his excitable and wayward disposition drove her to her grandmother's house at Burton Pynsent. A year or

two later she travelled abroad, but her cravings after distinction were not satisfied until she became the chief of her uncle's household in August 1803 She sat at the head of his table and assisted in welcoming his guests, gracing the board with her stately beauty and enlivening the company by her quickness and keenness of conversation Although her brightness of style cheered the declining days of Pitt and amused most of his political friends, her satirical remarks sometimes created enemies when more consideration for the feelings of her associates would have converted them into friends Lady Hester Stanhope possessed great business talents, and when Pitt was out of office she acted as his private secretary She was with him in his dying illness, and some of his last thoughts were concerned with her future, but any anxiety which might have arisen in her mind on this point was dispelled through the grant by a nation grateful for her uncle's qualities of a pension of £1200 a year, dating from 30th January 1806, which Lady Hester Stanhope enjoyed for the rest of her days On her uncle's death she lived in Montague Square, London, but life in London without the interest caused by associating with the principal politicians of the Tory party proved irksome to her, and she sought relief from lassitude in the fastnesses of Wales Whilst she remained on English soil happiness found no place in her heart, and her native land was finally abandoned for the East in February 1810 After many wanderings she settled on Mount Lebanon, and from this solitary position she wielded an almost absolute authority over the surrounding districts Her control over the natives was sufficiently commanding to induce Ibrahim Pasha, when about to invade Syria in 1832, to solicit her neutrality, and this supremacy was maintained by her commanding character and by the belief that she possessed the gift of divination Her cherished companion Miss Williams, and her trusted physician Dr Charles Lewis Meryon, dwelt with her for some time, but the former died in 1828, and the latter was not with Lady Hester when she died In this lonely residence, the villa of Djoun, 8 miles from Sidon, in a house "hemmed in by arid mountains," and with the troubles of a household of twenty-three servants, unregulated by a single English attendant or friend and only waiting for her death to plunder the house, Lady Hester Stanhope's strength slowly wasted away, and at last she died on 23d June 1839, aged sixty-three The disappointments of her life, and the necessity of overaweing her servants as well as the chiefs who surrounded Djoun, had intensified a temper naturally imperious In appearance as in voice she resembled her grandfather, the first Lord Chatham, and like him she domineered over the circle, large or small, in which she was placed

Some years after her death there appeared three volumes of *Memoirs of the Lady Hester Stanhope as related by herself in Conversations with her Physician* (i e, Dr Meryon), 1845, and these were followed in the succeeding year by three volumes of *Travels of Lady Hester Stanhope, forming the Completion of her Memoirs narrated by her Physician* They presented a lively picture of this strange woman's life and character, and contained many anecdotes of Pitt and his colleagues in political life for a quarter of a century before his death.

STANHOPE, Philip Dormer, fourth earl of Chesterfield See Chesterfield

STANISLAU (Pol *Stanislavoff*), the chief town in the district of the same name in Galicia, Austria, on the Albrecht and Lemberg-Czernowitz railways, in 49° 4′ N lat, 24° 30′ E long, has two real-schools, a gymnasium, and large ironworks It has also a good trade in corn The population (1885) numbers 18,626.

STANISLAUS (1677–1766), king of Poland Stanislaw Leszczynski or Lesznski was born at Lemberg on October 20, 1677 His father, Raphael Leszczynski, was a Polish nobleman, distinguished by his rank and the important offices which he held, but still more by his personal qualities Stanislaus, after visiting the courts of Vienna, Paris, and Rome, was raised to the dignity of voivode of Posen, and in 1704 was sent as ambassador by the assembly of Warsaw to Charles XII of Sweden, who had just declared the deposition of the recently elected Augustus II The king was so greatly taken with the ambassador that he recommended him to the diet as a suitable candidate for the vacant throne, the election accordingly followed on 12th July 1704, but the coronation of Stanislaus and his wife Catharina Opalinska did not take place until 4th October of the following year (compare Poland, vol xix p 297) After the reverse of Poltava in 1709 Augustus returned to Poland, and, assisted by the Russians, compelled Stanislaus to leave the country The next five years saw him leading a wandering and somewhat adventurous life in Europe, one of his objects being to procure a favourable peace for Charles (compare Charles XII) He then settled on Charles's estate at Zweibrucken, and after Charles's death in 1718 had a residence assigned to him by the French court at Weissenburg in Alsace In 1725 his daughter Maria became the wife of Louis XV of France On the death of Augustus in 1733 Stanislaus once more returned to Poland, where a majority declared for him, but his competitor, the young elector of Saxony, had the advantage of the support of the emperor Charles VI, and also of the empress of Russia Dantzic, to which Stanislaus had retired, was quickly taken by the Russians and the Saxons, and with great difficulty the unfortunate prince succeeded in making good his escape in disguise, after hearing that the Russians had set a price on his head. In 1736, when peace was concluded between the emperor and France, it was agreed that Stanislaus should abdicate the throne, but that he should be acknowledged king of Poland and grand-duke of Lithuania, and continue to bear these titles during life, and further, that he should be put in peaceable possession of the duchies of Lorraine and Bar, but that immediately after his death those duchies should be united for ever to the crown of France The remaining years of his life were prosperous and happy. He died at Lunéville on February 23, 1766, in consequence of injuries received from his nightdress accidentally taking fire

Stanislaus, who was a patron of the arts and sciences, wrote several works in politics and philosophy, which were collected and published at Paris in 1763, in 2 vols 8vo, under the title *Œuvres du Philosophe Bienfaisant* The *Œuvres Choisies de Stanislas, Roi de Pologne, Duc de Lorraine et de Bar*, with an historical notice by Madame de Saint-Ouen, were published in an 8vo volume at Paris in 1825

STANISLAUS AUGUSTUS, the last king of Poland, was born at Wolczyn in Lithuania in 1732 and died at St Petersburg in 1798. See Poniatowski, vol xix. p 453, and Poland, vol xix pp 297–8

STANLEY, Arthur Penrhyn (1815–1881), dean of Westminster from 1863, was born at Alderley in Cheshire on December 13, 1815 His father, the Rev. E. Stanley, rector of Alderley, bishop of Norwich from 1837 to 1849, was the younger brother of Sir John Stanley of Alderley Park, seventh baronet, who in 1839 was created Baron Stanley of Alderley, and was the representative of a branch of the same family as that of the earls of Derby His mother, Catherine Stanley, was the daughter of the Rev Oswald Leycester, rector of Stoke-on-Tern. Both parents were persons of remarkable force and individuality of character. The influence of each is to be traced in the career of their son It was his father's prayer as bishop of Norwich "that he might be an instrument in God's providence of extending more enlarged and more Christian views among the clergy, and thus the means of disseminating a wider

and more comprehensive spirit of Christianity throughout the land." Of his mother her son not only spoke, after her death in 1862, as "the guardian genius" that "had nursed his very mind and heart," but described her as "gifted with a spiritual insight which belonged to that larger sphere of religion which is above and beyond the passing controversies of the day." Arthur was then third child. His elder brother, Owen, died in 1850 at Sydney, after concluding, as commander of the "Rattlesnake" frigate, the survey of the Coral Sea. His sister Mary, well known for her work in the hospitals at Scutari and among the poor in London, died in 1880. Arthur was a child of highly sensitive organization and precocious intellectual activity. His boyish letters, journals, and poems were singularly like in their characteristic points to his later writings. But his extreme shyness and silence gave no promise of the social gifts which afterwards added so largely to his influence. At the age of fourteen his health, at one time alarmingly delicate, so far improved as to warrant his parents in sending him to Rugby, where Dr Arnold had been recently appointed head master. He remained at Rugby from 1829 to 1834, and of all Arnold's pupils may be said to have been the one who most fully responded to the influence of his master's teaching and character. In 1834 he became an undergraduate of Balliol College, Oxford, having obtained a scholarship in the previous year. Among his tutors at Balliol was Mr Tait, afterwards archbishop of Canterbury, and among his junior fellow scholars Benjamin Jowett, afterwards professor of Greek and master of Balliol. Arthur Stanley, after obtaining the Ireland scholarship and Newdigate prize for a remarkable English poem (on the Gipsies), was placed in the first class in 1837. In 1839, after a period of residence and study at Oxford, he was elected fellow of University College, and in the same year was admitted to holy orders. In 1840 he left England for a prolonged tour in Greece and Italy, and on his return settled at Oxford, where he resided from October 1841 for the next ten years, being actively engaged during term time as tutor of his college. He very shortly became an influential element in university life. His personal relations to his pupils were of a singularly close and affectionate nature, and the charm of his social gifts and genial character won him friends on all sides. His literary reputation was early established by the profound impression made by his *Life of Arnold*, whose sudden death had occurred in 1842, and whose biography, published in 1844, at once secured for its young author a high place among English writers. In 1845 he was appointed select preacher, and published in 1847 a volume of *Sermons and Essays on the Apostolic Age*, which not only laid the foundation of his fame as a preacher, but also marked his future position as a theologian. In university politics, which at that time wore mainly the form of theological controversy, he from the first took the place which he always retained of an uncompromising advocate of comprehension and toleration. As an undergraduate he had entirely sympathized with Dr Arnold in resenting the agitation led by, but not confined to, the High Church party in 1836 against the appointment of Dr Hampden to the regius professorship of divinity. As a young M.A., during the long-continued agitation which followed the publication in 1841 of Tract No. 90, and which ended in the withdrawal of the present Cardinal Newman from the English Church, he used all his influence to protect from formal condemnation the leaders and tenets of the "Tractarian" party. In 1847 he did his utmost to resist the movement set on foot at Oxford against Dr Hampden's appointment to the bishopric of Hereford. Finally, in 1850, in an article published in the *Edinburgh Review* in defence of the "Gorham judgment," which had secured the position in the English Church of the Evangelical clergy, he asserted two principles which he maintained to the end of his life,—first, "that the so-called supremacy of the crown in religious matters was in reality nothing else than the supremacy of law," and, secondly, "that the Church of England, by the very condition of its being, was not High, or Low, but Broad, and had always included, and been meant to include, opposite and contradictory opinions on points even more important than those at present under discussion."

It was not only in theological but in academical matters that his sympathies were on the liberal side. Though on many points of essentially conservative tendencies, he was greatly interested in university reform, and towards the end of his residence at Oxford acted as secretary to the royal commission appointed in 1850 to report on and to suggest improvements in the administrative and educational system of the university. Of the important changes in both these respects which, in the face of much opposition at the university, were carried out in due time under the sanction of parliament by an executive commission, Stanley, who took the principal share in drafting the report printed in 1852, was a strenuous advocate. These changes included the transference of the initiative in university legislation from the sole authority of the heads of houses to an elected and representative body, the opening of college fellowships and scholarships to competition by the removal of local and other restrictions, the non-enforcement at matriculation of subscription to the Thirty-nine Articles, and various steps taken to increase the usefulness and influence of the professoriate.

Before the report was issued, Stanley, who had lost his father in 1849, and both his brothers, Captain Stanley mentioned above, and Charles, secretary to the governor of Van Diemen's Land, within a few months of the same date, was appointed to a canonry in Canterbury cathedral. He held the office from 1851 till his return to Oxford. During his residence at Canterbury he published his *Memoir* of his father Bishop Stanley (1851), and completed his *Commentary on the Epistles to the Corinthians* (1855). In the winter and spring of 1852–53 he made the tour in Egypt and the Holy Land, the result of which was his well-known volume on *Sinai and Palestine*, first published in 1856. In 1857 he travelled in Russia, and collected much of the materials for his subsequent *Lectures on the Greek Church*, published in 1861. His *Memorials of Canterbury*, published in 1855, displayed the full maturity of his power of dealing with the events, scenes, and characters of past history which had marked him from childhood. Towards the close of the same period he accepted the office of examining chaplain to Dr Tait, his former tutor at Balliol and afterwards successor to Arnold at Rugby, on his transference from the deanery of Carlisle to the see of London.

At the close of 1856 Stanley was appointed by the crown to the professorship of ecclesiastical history, a post which, with the canonry at Christ Church attached to the office, he held till 1863. In the first of three inaugural lectures the new professor announced his intention of beginning his treatment of the subject with "the first dawn of the history of the church," the call of Abraham, and the first two volumes of his *History of the Jewish Church*, published in 1863 and 1865, consist of the substance of lectures delivered by him in his capacity as professor. In 1861 he published the volume on the Greek Church already referred to. His second residence at Oxford was marked by the same power of winning personal influence which had distinguished him as a college tutor, and by the efforts which he made, in his wider sphere as professor, to bring together in social intercourse

the leaders of the divergent and hostile parties between which the residents at the university were mainly divided

Much, however, of his time and efforts was given to religious controversy From 1860 to 1864 academical and clerical circles were agitated by the storm which followed the publication of *Essays and Reviews*, a volume to which two of his most valued friends—Benjamin Jowett and Mr Temple, the former professor of Greek at Oxford, the latter head master of Rugby and afterwards bishop in succession of Exeter and London—had been contributors For the exceedingly prominent part taken by Stanley in this exciting controversy the reader is referred to the second and third of his *Essays on Church and State*, collected and published in 1870 The result of his action was greatly to alienate the leaders of the High Church party, who had joined a large portion of the clergy in their efforts to procure the formal condemnation of the views advanced in *Essays and Reviews* In this and other questions, such as in the growing controversy on the position of Prof Maurice at King's College, Cambridge, and on that caused by Bishop Colenso's work on the Pentateuch, he had taken up a position which brought him into conflict with a large portion of the religious public It should be added that in the last year of his professorate (1863) he had published a *Letter to the Bishop of London*, strongly advocating a large relaxation of the terms of clerical subscription to the Thirty-nine Articles and Prayer-book An important Act amending the Act of Uniformity, and carrying out in some degree Stanley's proposals, was passed in the year 1865

In the spring of 1862 Stanley, at the queen's desire, had accompanied the prince of Wales on a tour in Egypt and the Holy Land During his absence he lost his mother, the heaviest domestic bereavement that had yet befallen him His sense of his debt towards her has been already indicated It stands recorded in his volume of *Memorials of Edward and Catherine Stanley*

Towards the close of the following year he was appointed by the crown to the deanery of Westminster, in succession to Dean Trench, raised to the see of Dublin In December he married Lady Augusta Bruce, sister of Lord Elgin, then governor-general of India, herself one of the queen's most trusted friends In January 1864 he entered on the duties of his new post

His tenure of the deanery of Westminster was memorable in many ways He recognized from the first two important disqualifications,—his indifference to music and his slight knowledge of architecture On both these subjects he availed himself largely of the aid of others, and threw himself with characteristic energy and entire success into the task of rescuing from neglect, preserving from decay, and commending to the interest of all classes of his countrymen the treasure of historic monuments in which the abbey is so rich No visitor can pass through the building, now so often thronged with crowds of the working classes, the mere possibility of attracting whom was spoken of before a royal commission so lately as 1841 as quite chimerical, without recognizing the successful result of his indefatigable labours The monument to the brothers Wesley, the inscription on the gravestone of Livingstone, and the restored altar in her husband's chantry in which he placed the neglected remains of Catherine of Valois, the queen of Henry V, may be named among the innumerable and ubiquitous records of his wide sympathy and historic ardour Within three years of his appointment he published his *Memorials of Westminster Abbey*, a work which, although not free from occasional inaccuracies, is a mine of information conveyed in the most picturesque and impressive form. He was a constant preacher, and gave a great impulse to the practice already begun of inviting distinguished preachers to the abbey pulpit, especially to the evening services in the nave, which had been established under his predecessor It is to him that is largely due the vast increase in the number not of visitors only but of worshippers in the abbey He began the practice, since continued by others of the abbey clergy, of devoting his Saturday afternoons to conducting parties of working men round the abbey and collegiate buildings. His social and personal influence, already unique of its kind, was enormously increased by his removal to London His circle of friends was constantly widening, and extended from the queen and royal family to the working men of London and elsewhere, some of whom he inspired with a singular devotion It included men of every denomination, every class, every part of the United Kingdom, and almost of every nation He was untiring in literary work, and, though this consisted very largely of occasional papers, lectures, articles in reviews, addresses, and sermons, it included a third volume of his *History of the Jewish Church*, a volume on the *Church of Scotland*, another of *Addresses and Sermons* preached in America, and an exceedingly important volume, completed within a few months of his death, on *Christian Institutions*

He was continually engaged in theological controversy, and, if his advocacy of all efforts to promote the social, moral, and religious amelioration of the poorer classes and his chivalrous courage in defending those whom he held to be unjustly denounced won him the warm admiration of many of his countrymen, he undoubtedly incurred much and growing odium in influential circles Among the causes of offence might be enumerated, not only his vigorous defence of one from whom he greatly differed, Bishop Colenso, but his invitation to the holy communion of all the revisers of the translation of the Bible, including a Unitarian among other Nonconformists, as well as the whole tone and teaching of almost every page of his publications Still stronger was the feeling caused by his efforts to make the recital of the Athanasian Creed optional instead of imperative in the English Church

In 1874 he spent part of the winter in Russia, whither he and Lady Augusta had gone to take part in the marriage of the duke of Edinburgh In the spring of 1876, after a long and lingering illness, he lost his wife, the zealous partner of all his social and charitable efforts, and the constant cheerer and sympathizer in his many labours and conflicts It was a terrible blow, and one from which he never entirely recovered But in 1878 he was deeply interested by a tour in America, and in the following autumn visited for the last time, with his sister, Mary Stanley, who died before the close of the same year, northern Italy and Venice

In the spring of 1881 he preached funeral sermons in the abbey on Mr Carlyle and Lord Beaconsfield, winding up with the latter a series of *Sermons preached on Public Occasions*, mainly on the death or funeral of eminent Englishmen, which form a volume singularly characteristic of his special gifts He saw also the completion of the latest of his volumes, that already mentioned on *Christian Institutions*, and was in the course of the summer correcting for the press a paper on the *Westminster Confession*, and preaching in the abbey a course of Saturday *Lectures on the Beatitudes* On July 10 he was attacked by a sudden illness, which in a few days assumed a more alarming character, and ended fatally on the 18th The sensation caused by his death was profound and widespread He was buried in Henry VII's chapel, in the same grave as his wife His pall-bearers comprised representatives of literature, of science, of both Houses of Parliament, of theology, Anglican and Nonconformist, and of the universities of Oxford and Cambridge The recumbent monument placed upon the spot, and the windows in the

chapter house of the abbey, one of them a gift from the queen, were a tribute to his memory from friends of every class in England and America

The influence of Dean Stanley was no doubt largely due to his marvellous social gifts His affectionate nature, his quick and ready sympathy, his keen interest in almost every field of knowledge, his own mental resources, drawn from incessant reading and enriched by travel, observation, and conversation, his familiarity with the persons, places, events, and scenes of history, his tenacious yet discriminating memory, his vivacity and humour, the very charm of his countenance and manner, the delicately sensitive face, "the eye now beaming with sympathy, now twinkling with humour," acted like a spell in winning friends and even in conciliating opponents The courage and fearlessness with which he was always ready to uphold the cause of those whom he held to be unjustly attacked by a powerful or dominant majority was duly appreciated by his countrymen It may probably be said that no one in the present century was so endeared to so large a circle of personal friends in all parts of the civilized world His writings also, apart from their controversial aspect, were of a singularly attractive kind His *Life of Arnold*, his *Sinai and Palestine*, his *Lectures on the Jewish Church*, his *Memorials* of Canterbury and of Westminster Abbey, would alone have made him one of the most delightful and popular of English authors His sermons, always interesting and attractive, were at times singularly eloquent and impressive His occasional hymns and short poems, full of grace and force, and occasionally of a profound pathos, were fully worthy of his literary position Throughout all that he ever wrote there is an individuality and a characteristic flavour which is saved from mannerism by an inexhaustible freshness of view and a marvellous fertility of illustration His power of painting the scenes, events, and persons of past history, "the picturesque sensibility," to use a phrase applied to him by Lord Beaconsfield, with which he at once fastened on the main features of an historic building or a famous locality, amounted to genius, they were as marked at the close of his life as in the earliest of his schoolboy letters They won him readers of every class

But it would be impossible to speak even briefly of his literary position by itself To write his life in full would be to give a sketch of English ecclesiastical history for a long generation Though he resolutely stood aloof from all connexion with party, it is impossible not to recognize even in his least controversial writings the position which he held as, in the eyes of the greatest portion of his countrymen, the leading liberal theologian of his time in England Throughout his writings in prose or poetry, on almost every subject which he touched, we see the impress, not only of his distinctive genius and of his extraordinary gifts, but also of his special views, aims, and aspirations It may be well to describe these as nearly as possible in his own words He looked on the age in which he lived as one of mingled hope and gloom, as a period of transition, to be followed either by an "eclipse of faith" —a "winter of unbelief"—or by a "revival of Christianity in a wider aspect," a "catholic, comprehensive, all-embracing Christianity" that "might yet overcome the world" He believed, and was never tired of asserting his belief, "that the Christian church had not yet presented its final or its most perfect aspect to the world", that "the belief of each successive age of Christendom had as a matter of fact varied enormously from the belief of its predecessor", that "all confessions and similar documents are, if taken as final expressions of absolute truth, misleading", that each "successive form of theology is but the approximation to the truth, not the whole truth itself", that it was "the glory of the church to be always advancing to perfection", and that "there still remained, behind all the controversies of the past, a higher Christianity which neither assailants nor defenders had fully exhausted "

Already even in his early *Sermons on the Apostolic Age*, as in *Sinai and Palestine*, as in the volumes on the *Jewish Church*, "one increasing purpose" may be recognized Everywhere we see the sustained effort to "bring the events, places, and characters of sacred history within the domain of actual observation and history," and to rescue them from "the conventional haze in which they had been veiled by a misplaced reverence" "The first duty of a modern theologian" he held to be "to study the Bible, not for the sake of making or defending systems out of it, but for the sake of discovering what it actually contains" "In a faithful study of that virgin mine, the yet insufficiently explored records of the Old and New Testament, lay," he held, "the best hope of the church of Christ," and another and a different estimate "of the points on which Scripture lays its most emphatic stress" To this study he looked for the best hope of such a progressive development of Christian theology as should avert the danger arising from "the apparently increasing divergence between the intelligence and the faith of our time," "and should enable the church to deal wisely with new questions which ancient theology had for the most part not even considered" On the direction which this development of theology should assume the last word had not, he knew, been spoken, but he enforced the duty "of placing in the background whatever was accidental, temporary, or secondary, and of bringing into due prominence what was primary and essential" In the former group Stanley would, without doubt or hesitation, have placed all questions connected with Episcopal or Presbyterian orders, or that deal only with the outward forms or ceremonies of religion, or with the authorship or age of the books of the Old Testament Even to the question of miraculous and external evidence he would have been inclined to assign a secondary place, as well as to the most elaborate statements of Christian doctrine

The foremost and highest place, that of the "essential and supernatural" elements of religion, he would have reserved for its moral and spiritual truths, "its chief evidence and chief essence," "the truths to be drawn from the teaching and from the life of Christ," in whose character he did not hesitate to recognize "the greatest of all miracles" On a large development of Christian teaching in this direction he based all his hopes alike of the progress of the world and of the restitution to Christian theology—"as something greater and vaster than the theology of each particular church or age," "as comprehending all the wholesome elements of thought at work in the world"—of "its natural ascendency over the minds of educated men"

With such views it was not to be wondered at that, from first to last, he never lost an opportunity of supporting a policy of width, toleration, and comprehension in the Church of England The view which he took in his earliest directly controversial work, his *Essay on the Gorham Judgment* (1850), as regards both the protection offered by the law to the clergy against "the inquisition of arbitrary prelates and of tumultuous synods," and "on the designedly mixed and comprehensive character of the English formularies and English Church," has already been fully indicated The same spirit and the same aims guided his line of conduct in other controversies, such as in that on the *Essays and Reviews*, on the ritualistic movement, on the question of subscription, on the successive attacks made on men so wholly different from each other as Prof Maurice, whose influence on the mind of his generation has yet to be fully estimated, and Bishop Colenso, and in his vain but earnest advocacy of the optional instead of the compulsory use of the Athanasian Creed So again he was always eager to insist on the essential points of union between various denominations of Christians, however apparently divided or estranged, and to recognize the special services conferred on the world, not only by the Eastern, the Roman, the Lutheran, and the Reformed Churches, not only by the Presbyterian Churches of Scotland, but also by the Baptist and Congregational Churches of England and America, and by the community of Quakers And, while in this respect he was keen almost to excess to note points of agreement, so in the very latest volume which he published one of his main aims was "to look the facts of history in the face" and to point out "the almost universal departure from primitive usage," "the transformation both of letter and spirit through which the greatest Christian ordinances had already passed," and "to fix the eye steadily on the germs of truth that were common to the different forms which the ordinances wore, the moral and spiritual realities for the sake of which alone (if Christianity be the universal religion) such forms exist" He was throughout his life an unflinching advocate of the connexion between church and state By this he understood—(1) "the recognition and support on the part of the state of the religious expression of the faith of the community," and (2) "that this religious expression of the faith of the community on the most sacred and most vital of all its interests should be controlled and guided by the whole community through the supremacy of law" In the supremacy of the crown, *i e*, of law, "over all causes and all persons, ecclesiastical as well as civil," so far from finding "galling chains" or "ignominious bondage," he welcomed it not only as being "the most powerful and intelligent organ of the whole community," but on two other grounds First, he considered that supremacy more likely "to be truly wise and truly just and therefore truly Christian than the headship either of a bishop or of a synod of any clerical or sectional body," and, secondly, "as the best security for that gradual growth of religious forms and religious opinions, and for that free expression of individual belief, which is indispensable to any healthy development of religious life and religious truth" At the same time he was in favour of making the creed of the church as wide as possible,—"not narrower than that which is even now the test of its membership, the Apostles' Creed,"—and of throwing down all barriers which could be wisely dispensed with to admission to its ministry As an immediate step he even advocated as "an unmixed good" "the admission under due restrictions of our nonconforming brethren of England, and our Presbyterian brethren of the Scottish Church," to preach in Anglican pulpits. To the last hour of his life he looked with dismay to the prospect of a combined assault by a triple alliance of the representatives "of the Puritans, of Voltaire, and of Laud" on "that rare combination which with all its shortcomings exhibits one of the noblest works which God's providence, through a long

course of years, his raised up in Europe," "on the most venerable growth of English history, the framework which has sheltered down to this time the freedom of the freest, the teaching of the most learned, and the reason of the most rational church in Christendom." He believed that the "success of such an attack would result in throwing away the best opportunity which the world affords for the growth side by side of intellectual activity and religious earnestness", that to destroy it would be, as he said of the Established Church of Scotland, "to destroy, so far as human efforts can destroy, the special ideas of freedom, of growth, of comprehension which are inherent in the very existence of a national church", that its destruction would only produce 'an enslaved clergy amidst an indifferent laity," and tend to degrade the Church of England from its historic position 'to that of an illiterate sect, or a satellite of the Church of Rome."

With such views it was impossible that Stanley could have found much sympathy from either of the two great parties among the English clergy. Indeed it was impossible that any party, or any community, which placed the essence of Christianity in the careful guardianship of any circle of theological doctrines could feel in harmony with one who dwelt with such exceeding and growing emphasis on the secondary nature, not only of all that was ceremonial, but on much that was dogmatic, as compared with that which was spiritual and moral.

By the "Evangelical" section of the religious world the biographer of Arnold had been looked on from the first with more than suspicion. Later on, even the mode and form of his defence of their own side in the Gorham controversy, his avowed advocacy of a wide freedom of thought on many questions, especially those connected with Biblical criticism, his attitude towards such subjects as inspiration, justification, and future punishment, were more than distasteful. His loud acknowledgment of the debt owed by Christendom to German theology, "to the most laborious, truth seeking, and conscientious of Continental nations," his persistent claims for a place within the Church of England for views that "went to the verge of Rome," the more than width—the universality—of his religious sympathies, his delight in placing, not Walter Scott only, or Tennyson, or the author of *Ecce Homo*, but Goethe, and Burns, and Matthew Arnold, and J. Stuart Mill in the ranks of religious teachers, were naturally repugnant to those who cared to read his works, and were not content to shrink in silent dismay from the warm sympathizer with Professor Maurice, the enthusiastic admirer of F. Robertson, and the apologist in turn of *Essays and Reviews* and of Bishop Colenso.

Against the feelings provoked by this aspect of his theological position, neither his acknowledged services to Biblical study, nor his profound and entire belief in the true key to the difficulties of the future being involved in the prosecution of that study, nor his sympathy with their own views as to the relation of the individual soul to God, nor his repeated, his almost daily assertions of the sacredness and value of the gospel history, or of the regenerative power of the Divine life and person of Christ as the "one Master worth living for worth dying for," could avail much. Whatever the feelings of individuals, the organs of the party of whose once imperilled claim to remain within the fold of the Church of England he had been the staunchest upholder spoke of him from first to last with almost unqualified aversion. He was, or became in due time, even more obnoxious to at least the more advanced section of the High Church party. Nor was this to be wondered at. The differences between him and them were vital and fundamental, and, even where he defended their right—at one time repeatedly challenged—to maintain their distinctive views and observances in the Church of England, he rested their claim on grounds which would hardly win their approval or gratitude. The more clear sighted of their leaders felt that, if the points of ceremonial, of dress, posture, attitude, ritual, on which they laid exceeding stress, were treated by him with toleration, they were regarded with an indifference that verged upon contempt, as *tolerabiles ineptiæ*, and that he delighted to trace their historical development, and to strip them of all that was essential, significant, or primitive. They felt even more strongly that in that which, to the leaders at least, gave their real interest and importance to all questions of vestments or observances, and even underlay some of the most important questions of religious doctrine,—the very existence of an order of priesthood as the divinely and exclusively commissioned channel of communication between God and man,—the rejection on the part of Stanley of their most cherished and central dogma was absolute and uncompromising. And the difference of view was vital. Much else in his writings might have been welcomed or condoned. His love for the past, his deep and full sympathy with much in the medieval church, his warm admiration for many of its saints and heroes, his aversion to mere iconoclasm, his poetic and imaginative sensibility, had much to attract them. Even in his treatment of many important religious subjects it was often not so much his actual sentiments as the *tendency*—the more than tendency, the avowed aim—of all his writings to promote freedom of inquiry and of thought, rather than submission to church authority, which provoked hostility. But on this question there was no room for compromise. That which they and he alike recognized as the fundamental tenet to which all their distinctive teaching pointed he spoke of as a belief "that they (the clergy) were the depositaries of mystical, supernatural, almost magical influence, independent of any moral or spiritual graces," and on this point he spoke with no doubtful voice. It was, he said, this belief in a "fixed, external, necessary medium on earth between the soul and God which, if he had rightly read the Psalms of David, the epistles of Paul and the gospel of Christ, true religion is always striving to dispense with," and "the more it can be dispensed with, the nearer and the higher is the communion of the human spirit with its Maker and its Redeemer." And this language (used in 1867) was in entire accordance with the manner in which in his latest volume (1881) he hinted at the possibility of "the growing materialism of the ecclesiastic sacristy so undermining the spiritual element of almost the only external ordinance of Christianity (the Eucharist), unquestionably the greatest religious ordinance in the world," "as even to endanger the ordinance itself." In addition to this fundamental divergence of view, it must be remembered that it was to this party, as the representatives of one "always forgetful in its gratitude and implacable in its vengeance," that he looked for the main danger to freedom of thought and width of comprehension in the future, and that he did not hesitate to remind them, even as he supported their claims to the largest possible interpretation of the Articles, that they "claimed a latitude themselves which they constantly refused to others." It will be easily understood therefore that whatever influence Stanley wielded in the church was wholly independent of either of the two great parties into which he found it mainly divided, above all of that which at the time of his death appeared to be every year growing in power and confidence.

What was the extent, what the permanent force of his own influence, is a question not easily answered at present. "Dean Stanley," said Dr Story, "stood higher in the respect and affection of a larger and more varied circle of members of many churches than any ecclesiastic in the world." It is not easy to disengage his personal and social charm, the affection borne him by all who had even momentarily passed within the circle of his striking and attractive individuality, the warm feelings which much in his life, much in his writings, had called forth from multitudes who never saw him, from the more abiding impression made during his lifetime and after his death by the writings which he has left behind him. Yet if, setting aside one single name, that of Prof. Maurice, he be taken as the most prominent, the most fertile, the most gifted, and the most impressive exponent and defender of liberal theology, some estimate may be formed even now of the mark which he made upon his age. It would be easy to undervalue the effect of the work which he did. It might seem at first sight as if his own gloomier anticipations had been fulfilled. He spoke from time to time of a danger of the age being overwhelmed, now by "a general return of forgotten superstitions," now "by a general chaos of incredulity," and of himself as "having perhaps done no more than make good a starting point for those who come after us, perhaps in the 20th or 21st century." He might have seemed to enter into the spirit of his father's words, "My only hope and consolation is that I am a pioneer for better days, and that the seed which I aim, as far as can be, at sowing may bring forth fruit when I am gone to a better and more peaceful world." But such a view would be to a large extent superficial. If the success achieved by the cause of which Stanley was the main representative is carefully weighed, it will be found to be great in solid and direct results, far greater probably in those which are less easily summed up and tabulated. On the questions which he had most at heart, the real and careful and critical study of the sacred records, the progress made since he first lectured as a tutor at Oxford on the Old and New Testaments has been enormous. The large majority of the works published have been written more or less in the spirit in which he would have largely or entirely sympathized. It may be added that of these there are few which would not have encountered, if not fierce criticism, yet at least grave suspicion, some forty years ago. The combination of a reverent treatment of Holy Scripture with fearless inquiry into all questions connected with its criticism is a new birth in English literature. It is one in which he took a leading part, and in the defence of which he bore, sometimes in his own behalf, oftener in chivalrous defence of others, much of the brunt of the earlier and later contests. The impulse which he gave to the study alike of the Bible and church history was a great one. In each he may be recognized, not of course as the originator, but as the representative, of a new school of thought and of treatment, and those who are most familiar with his writings can hardly open a new book by any English theologian, hardly read a sermon of many preachers, above all on any portion of the Old Testament, in which they do not trace his immediate influence. He may be said in a very true sense to colour the writings of many of those who most differ from him. The subjects to which he looked as

the most essential of all—the universality of the Divine love, the supreme importance of the moral and spiritual elements of religion, the supremacy of conscience, the sense of the central citadel of Christianity as being contained in the character, the history, the spirit of its Divine Founder—have beyond doubt, if not yet taken fully the place which he claimed for them, yet impressed themselves more and more on the teaching and the preaching of every class of clergy in the church. They have lifted the teaching of those who most differed from him far above the level of a mechanical or merely ceremonial form of mediæval worship. The great cause too for which he strove so hard, that of comprehension and mutual toleration, the true "enlargement of Christ's church," has gained much from his efforts,—much in the present, and perhaps, in spite of some appearances to the contrary, more in the future. Whatever storms of party strife may be in store for the church, active and energetic Christians of opposite parties no longer waste their energies in mutual attacks, but have learned to work together in Christian teaching and in works of Christian beneficence. His surviving friends may rejoice to remember that no one person had, for, it may be, many generations, done so much as Stanley to draw together in friendly and social intercourse the leaders of various religious parties and of different denominations of Christians.

Those who live, and feel that they live, in an age of transition cannot venture to prophesy the precise form and colour of the religious movement which will in due time succeed that which now seems to be the most prevalent and the most outwardly active. But they may be permitted to hold that its main features were descried and anticipated, even if dwelt on with excessive emphasis, by Stanley,—to believe that the next phase of a Christian theology which shall regain a due ascendency over the thought and intelligence of the civilized world will be embodied in some larger realization of "the one unchangeable element in Christianity," of the witness borne by the teaching and life of Christ to the higher and spiritual nature and destinies of man and to the "principles of freedom, justice, toleration, beneficence, self denial, universal sympathy, and fearless love of truth, in which all the hopes of a true and permanent development of Christian theology must take their stand." None will have laboured more earnestly in this cause than Arthur Stanley. (G. G. B.)

STANTON, EDWIN M'MASTERS (1833–1869), American statesman, was born in Ohio, December 19, 1814, graduated at Kenyon College in 1833, and was admitted to the bar of his native State. Just at the end of Buchanan's administration in 1860–61, Stanton was called upon to act as attorney-general. In 1862, after the inauguration of Lincoln, the new president, who had had great difficulties with his war office, placed Stanton at its head, where he was at home at last. His intense vigour, excellent organizing powers, and scrupulous honesty were the life of the Federal war department throughout the Civil War, and it may be worth while to note that, after living through boundless opportunities of peculation, he died, like most of the public servants of the United States, a poor man. In spite of his many services to the country, it was not always easy for his associates to get on with him comfortably, and his quarrels with President Johnson were especially bitter in 1867–68, ending in the impeachment of Johnson by the House of Representatives. On the acquittal of the president Stanton resigned, and resumed the practice of law. President Grant, in 1869, made him a justice of the supreme court, but his work during the war had worn him out, and he died December 24, 1869.

STARAYA RUSSA, a district town of Russia, in the government of Novgorod, 62 miles to the south of that city, on the river Polist, by means of which and Lake Ilmeñ it is brought into easy steamer communication with St Petersburg. Some brine springs, of no great strength, on the eastern side of the town, were used as a source for the supply of salt as late as 1865, yielding about 50,000 cwts annually, at present they are used only as mineral waters, having a great resemblance to those of Kreuznach. Some thousands of visitors resort to them every summer, and owing to this circumstance Staraya Russa is better built and kept than any other town in Novgorod. The 13,100 inhabitants are supported chiefly by the summer-visitors. About 100 individuals in all employ themselves in brick-making, tanning, and sawing timber, and there is a trade in rye, oats, and flax shipped to St Petersburg to the value of about £50,000 per annum.

The name of Staraya Russa occurs in the Russian annals as far back as 1167. It was one of the minor towns of the republic of Novgorod, and suffered continually in the wars for possession of the region between Russia, Lithuania, and Livonia. It was afterwards annexed to Moscow.

STARCH is an organized product of the vegetable kingdom, forming one of the most important and characteristic elements of plant life, and an abundantly stored reserve material for the discharge of vegetative functions. It originates within the living vegetable cell through the formative activity of chlorophyll under the influence of light, and is consequently an unfailing characteristic of all plants containing that body (compare PHYSIOLOGY, vol. xix. p. 54). Starch found within leaves and other green parts of plants is assimilated and transformed with great rapidity, accumulations of it are carried as starch-formers, and redeposited as starch in special reservoirs or portions of plants as the period of maturity approaches. In this way the body is found to gorge the stems of certain palms—the sago, &c.—just before these plants begin to form their fruit, it is the principal constituent of the underground organs of biennial and perennial plants, tap roots, root-stocks, corms, bulbs, and tubers, and it is abundantly stored in many fruits and seeds, as in the cereals and pulses, in bananas, bread-fruit, &c. It occurs in minute granules varying in diameter from 1 to 100 and even 200 micromillimetres, and the granules from different sources have each a distinct microscopic character, their forms and size being, however, affected according as they are aggregated in clusters or individually formed (see vol. ii. p. 631, figs. 3 to 6). Under the microscope these granules are seen to consist of a nucleus or hilum surrounded by layers arranged concentrically or excentrically, and the relations of hilum and layers are the most distinctive features of individual starches. Whether the hilum point bears to the granule the relation of a nucleus is a matter of dispute, the general opinion being that the grains are formed from without inwards, the centre being invariably the softest and most soluble portion, while the outer layers are most closely related to cellulose. Starch consists of a white or yellowish-white glistening powder, which on being rubbed between the fingers emits a crackling sound. It is only slightly acted on by cold water, but under the influence of heat in water it swells up, forming according to the proportions of starch and water a clouded opalescent paste. Iodine acts on it in water by producing a brilliant blue coloration, this reaction forming a very delicate and characteristic test. Diastase and dilute boiling sulphuric acid convert starch into a form soluble in hot water, whence it passes into a series of easily soluble dextrins, and finally into the condition of the sugars, dextrose and maltose. In its chemical relations starch consists of an intimate mixture of two isomeric bodies,—granulose and starch cellulose,—or rather of a series of gradations from the one to the other, the starch cellulose being principally in the external layers, while the granulose is found in the central portions of the granules. Starch cellulose is a body intermediate between granulose and ordinary cellulose, from the latter it is distinguished by being reducible to soluble starch by boiling in water and by digesting in caustic alkali. Together, the substances consist of a combination of carbon with hydrogen and oxygen, the commonly received formula being $C_6H_{10}O_5 + 2H_2O$, but Nageli, Sachsse, and many other recent investigators show reason why the molecule should be regarded as consisting of $C_{36}H_{62}O_{31} + 12H_2O$.

As an economic product starch in its separate condition is a most important alimentary substance, the chief pure

food starches being ARROWROOT, SAGO, TAPIOCA (*qq v*), and corn-flour, the starch of the MAIZE (*q v*) In its combined condition, in cereals, &c, starch is certainly the greatest and foremost of all the elements of nutrition (compare DIETETICS and NUTRITION) In its other industrial relations starch is used—(1) directly, as a thickening material in calico printing, for the dressing and finishing of many textiles, for laundry purposes, adhesive paste, and powder, and (2) indirectly, for the preparation of dextrin and British gum and starch sugar Maize, wheat, and rice starch are principally employed for the direct applications, and for the dextrin and starch-sugar manufacture potato starch is almost exclusively selected

In the preparation of starch the object of the manufacturer is to burst the vegetable cell walls, to liberate the starch granules, and to free them from the other cell contents with which they are associated When, as in the case of the potato, the associated cell contents, &c, are readily separated by solution and levigation the manufacture is exceedingly simple Potato starch is prepared principally by carefully washing the potatoes and in a kind of rasping machine reducing them to a fine pulp, which is deposited in water as raw starch The impurities of this starch—cellulose, albuminoids, fragments of potato, &c—are separated by washing it in fine sieves, through the meshes of which the pure starch alone passes The sieves are variously formed, some revolving, others moving horizontally or in such manner as to keep the material in agitation The starch is then received in tanks, in which it settles, and so separates from the soluble albuminoids and salts of the potatoes The settling of the starch is much retarded by the dissolved albuminoids, and to hasten the separation small quantities either of alum or of sulphuric acid are employed Alum coagulates the albumen and to that extent contaminates the starch, while the acid acts on the starch itself and is difficult of neutralization After the starch has settled, the brown-coloured supernatant liquor is drawn off and the starch again washed either in tanks or in a centrifugal machine Finally it is dried by spreading it in layers over porous bricks (a process not required in the case of starch washed in a centrifugal machine) and by exposure to the air, after which it still retains a large proportion of water, but is in a condition for making dextrin or starch-sugar For further drying it is ground to a rough powder, and dried thoroughly in a hot chamber, then reduced to a powder and sifted A method of reducing potatoes to a pulp by slicing and heaping them up till fermentation takes place is said to give a large yield of starch, but it is not much practised

In dealing with the starches of the cereals, there is greater difficulty, owing to the presence of gluten, which with water forms a tough elastic body difficult of solution and removal The difficulty is experienced in greatest measure in dealing with wheat, which contains a large proportion of gluten Wheat starch is separated in two different ways—(1) the fermentation method, which is the original process, and (2) by mechanical means without preliminary fermentation In the fermentation process whole wheat or wheaten meal is softened and swollen by soaking in water Wheat grains are, in this condition, ground, and the pulp, mixed to a thickish fluid with water, is placed in tanks, where it ferments, developing acetic and volatile acids which dissolve the gummy constituents of the wheat, with part of the gluten, and render the whole less tenacious After full fermentation, the period of which varies with the weather and the process employed, the starch is separated in a washing drum It is subsequently washed with water, which dissolves out the gluten, the starch settling in two layers,—one comparatively pure, the other mixed with gluten and some branny particles These layers are separated, the second undergoing further washing to remove the gluten, &c, and the remaining operations are analogous to those employed in the preparation of potato-starch By the mechanical process wheaten flour is kneaded into a stiff paste, which, after resting for an hour or two, is washed over a fine sieve so long as the water passing off continues milky, whereby the starch is liberated and the greater part of the gluten retained as a gluey elastic mass in the sieve The starch is subsequently purified by fermentation, washing, and treatment in centrifugal machines. The gluten thus preserved is a useful food for diabetic patients, and is made with flour into artificial macaroni and pastes, besides being valuable for other industrial purposes

Maize starch is obtained by analogous processes, but, the proportion of gluten in the grain being smaller, and less tenacious in its nature, the operations, whether chemical or mechanical, present fewer difficulties Under one method the separation of maize starch is facilitated by steeping, swelling, and softening the grain in a weak solution of caustic soda, and favourable results are also obtained by a process in which the pulp from the crushing mill is treated with water acidulated with sulphurous acid

In the preparation of rice starch a weak solution of caustic soda is also employed for softening and swelling the grain It is then washed with pure water, dried, ground, and sifted, and again treated with alkaline water, by which the whole of the nitrogenous constituents are taken up in soluble form An acid process for obtaining rice-starch is also employed, under which the grain, swollen and ground, is treated repeatedly with a solution of hydrochloric acid, which also dissolves away the non starchy constituents of the grain The laundry starches now in use are principally made from rice and from pulse (J PA)

STAR-CHAMBER, the name given in the 15th, 16th, and 17th centuries to an English high court of justice, consisting of the members of the ordinary council, or of the privy council only, with the addition of certain judges, and exercising jurisdiction, mainly criminal, in certain cases The origin and early history of the court are somewhat obscure The Curia Regis of the 12th century, combining judicial, deliberative, and administrative functions, had thrown off several offshoots in the Court of King's Bench and other courts, but the crown never parted with the supreme jurisdiction whence the subsidiary courts had emanated When in the 13th century the council became a regular and permanent body, practically distinct from the parliament of estates, this jurisdiction continued to be exercised by the king in council As the ordinary law-courts became more systematic and important, the indefinite character of the conciliar jurisdiction gave rise to frequent complaints, and efforts, for the most part fruitless, were made by the parliaments of the 14th century (*e g*, in 15 Edw II and 2 Edw III) to check it The equitable jurisdiction of the chancellor, which grew up during the reign of Edward III, flowed from this supreme judicial power, like the common law-courts under Henry II, but without drying up the original source It is in the reign of Edward III that we first hear of the "chancellor, treasurer, justices, and others" exercising jurisdiction in the "star-chamber" or "chambre de estoiles" at Westminster In Henry VI's reign one Danvers was acquitted of a certain charge by the king's council "in camera stellata" Hitherto such Acts of Parliament as had recognized this jurisdiction had done so only by way of limitation or prohibition, but in 1453, about the time when the distinction between the ordinary and the privy council first became apparent, an Act was passed by which the chancellor was empowered to enforce the attendance of all persons summoned by the privy seal before the king and his council in all cases not determinable by common law At this time, then, the jurisdiction of the council was recognized as supplementary to that of the ordinary law-courts. But the anarchy of the Wars of the Roses, and the decay of provincial justice owing to the influence of great barons and the turbulence of the lower classes, obliged parliament to entrust wider powers to the council. This was the object of the famous Act of 3 Hen VII, which was quoted by the lawyers of the Long Parliament as creating the court of star-chamber This, however, as is shown above, it was far from doing The Act of 3 Hen VII empowered a committee of the council, consisting of the chancellor, treasurer, privy seal, or any two of them, with the chief justices, or in their absence two other justices, a bishop, and a temporal lord, to act as a court of justice for enforcing the law in cases where it was thwarted by bribery, intimidation, or partiality The jurisdiction thus entrusted to a committee of the council was not, therefore, like that granted in 1453, supplementary, but superseded the ordinary law-courts in cases where they were too weak to act The Act simply supplied machinery for the exercise under special circumstances of that extraordinary penal jurisdiction which the council had never ceased to possess This jurisdiction, Bacon tells us, was still further developed and organized by Wolsey The court established by the

Act 3 Hen VII continued to exist for about fifty years, but disappeared towards the end of Henry VIII's reign Its powers were not lost, but fell back to the general body of the council, and were among the most important of those exercised by the council sitting in the star-chamber A court not unlike that created in 3 Hen VII was erected in 1540 The Act of 31 Hen VIII, which gave the king's proclamations the force of law, enacted that offenders against them might be punished by the usual officers of the council, together with some bishops and judges, "in the star-chamber or elsewhere" These powers also came after a time, like those granted in 1488, to be exercised by the council at large instead of by certain members of it It is clear, however,—and this was one of the chief complaints against the court,—that the jurisdiction which belonged by law or custom to the whole body of the king's council was usurped at this time by the inner body of advisers called the privy council, which had engrossed all the other functions of the larger body Sir T Smith (temp Eliz) tells us that juries misbehaving "were many times commanded to appear in the star-chamber or before the privy council for the matter" The uncertain composition of the court is well displayed by Coke, who says that the star-chamber is or may be compounded of three several councils—(1) the lords and others of the privy council, (2) the judges of either bench and the barons of the exchequer, (3) the lords of parliament, who are not, however, standing judges of the court Hudson (temp Car I), on the other hand, considers that all peers had a right of sitting in the court The latter class had, however, certainly given up sitting in the 17th century The jurisdiction of the court was equally vague, and, as Hudson says, it was impossible to define it without offending the supporters of the prerogative by a limitation of its powers, or the common lawyers by attributing to it an excessive latitude In practice its jurisdiction was almost unlimited It took notice of maintenance and liveries, bribery or partiality of jurors, falsification of panels or of verdicts, routs and riots, murder, felony, forgery, perjury, fraud, libel and slander, offences against proclamations, duels, acts tending to treason, as well as of a few civil matters,—disputes as to land between great men or corporations, disputes between English and foreign merchants, testamentary cases, &c,—in fact, "all offences may be here examined and punished if the king will" (Hudson) Its procedure was not according to the common law, it dispensed with the encumbrance of a jury, it could proceed on mere rumour or examine witnesses, it could apply torture, it could inflict any penalty short of death. It was thus admirably calculated to be the support of order against anarchy or of despotism against individual and national liberty During the Tudor period it appeared in the former light, under the Stuarts in the latter It was abolished by the Long Parliament in 1641, and was never afterwards revived [1]

Authorities —Smith, *Commonwealth of England*, Bacon, *Reign of Henry VII*, Hudson, *Treatise of the Court of Star-Chamber* (*Collectanea Juridica*, vol ii), Hallam, *Const Hist of England*, Gneist, *Engl Verfassungsgeschichte*, Dicey, *The Privy Council* (Arnold Prize Essay) The pleadings in the star chamber are in the Record Office, the decrees appear to have been lost. (G W P)

STARGARD, an ancient manufacturing town in eastern Pomerania, Prussia, is situated on the left bank of the navigable Ihna, 20 miles to the east of Stettin Formerly a member of the Hanseatic League, the town retains memorials of its early importance in the large church of St Mary, built in the 14th and 15th centuries, the 16th-century town-house, and the well-preserved walls with gateways and towers dating from the 14th century The extensive new law courts and three large barracks are among the modern buildings Stargard has a considerable market for cattle and horses, and carries on trade in grain, spirits, and raw produce Its manufactures include cigars, tobacco, wadding, and stockings, and there are also iron-foundries and linen and woollen factories in the town The population in 1885 was 22,109 (in 1816 8706), of whom about 730 were Roman Catholics and about 560 Jews

Stargard, mentioned as having been destroyed by the Poles in 1120, received town-rights in 1229, and became the capital of eastern Pomerania As a Hanseatic town it enjoyed considerable commercial prosperity, but had also to undergo siege and capture in the Middle Ages and during the Thirty Years' War In 1807 it was taken by Schill The name Stargard (from the Slavonic Starograd or Staragrod, meaning "old town") is common to several other towns in the north of Germany, of which the chief are Prussian Stargard, near Dantzic, and Stargard-in-Mecklenburg

STARLING (A S *Stær*, *Stearn*, and *Sterlyng*, Lat *Sturnus*, Fr *Étourneau*), a bird long time well-known in most parts of England, and now, through the extension of its range within the present century, in the rest of Great Britain, as well as in Ireland, where, though not generally distributed, it is very numerous in some districts It is about the size of a Thrush, and, though at a distance it appears to be black, when near at hand its plumage is seen to be brightly shot with purple, green, and steel-blue, most of the feathers when freshly grown being tipped with buff These markings wear off in the course of the winter, and in the breeding-season the bird is almost spotless It is the *Sturnus vulgaris* of ornithologists

To describe the habits of the Starling [2] within the limits here allotted is impossible A more engaging bird scarcely exists, for its familiarity during some months of the year gives opportunities for observing its ways that few others afford, while its varied song, its sprightly gestures, its glossy plumage, and, above all, its character as an insecticide—which last makes it the friend of the agriculturist and the grazier—render it an almost universal favourite The worst that can be said of it is that it occasionally pilfers fruit, and, as it flocks to roost in autumn and winter among reed-beds, does considerable damage by breaking down the stems [3] The congregations of Starlings are indeed very marvellous, and no less than the aerial evolutions of the flocks, chiefly before settling for the night, have attracted attention from early times, being mentioned by Pliny (*Hist Naturalis*, x 24) in the 1st century The extraordinary precision with which the crowd, often numbering several hundreds, not to say thousands, of birds, wheels, closes, opens out, rises, and descends, as if the whole body were a single living thing—all these movements being executed without a note or cry being uttered—must be seen to be appreciated, and may be seen repeatedly with pleasure For a resident, the Starling is rather a late breeder The nest is commonly placed in the hole of a tree or of a building, and its preparation is the work of some little time The eggs, from 4 to 7 in number, are of a very pale blue, often tinged with green As the young grow they become very noisy, and their parents, in their assiduous attendance, hardly less so, thus occasionally making themselves disagreeable in a quiet neighbourhood The Starling has a wide range over Europe and Asia, reaching India, but examples from Kashmir, Persia, and Armenia have been considered worthy of specific distinction, and the resident Starling of the countries bordering the Mediterranean is generally regarded as a good species, and called *S unicolor* from its unspotted plumage

Of the many forms allied to the genus *Sturnus*, some of which have perhaps been needlessly separated therefrom, those known as GRACKLES (vol xi p 26) have been already mentioned, and there is only room here to notice one other, *Pastor*, containing a beautiful species *P roseus*,

[1] The name is probably derived from the stars with which the roof of the chamber was painted, but it has also been derived from a Hebrew word *shetar*, or *sh'tar*, a bond, on the supposition that the room was that in which the legal documents connected with the Jews were kept prior to their expulsion by Edward I

[2] They are dwelt on at some length in Yarrell's *British Birds*, ed 4, vol ii pp 229–241

[3] A most ridiculous and unfounded charge has been, however, more than once brought against it—that of destroying the eggs of Skylarks There is little real evidence of its sucking eggs, and much of its not doing so; while, to render the allegation still more absurd, it has been brought by a class of farmers who generally complain that Skylarks themselves are highly injurious.

the Rose-coloured Starling, which is not an unfrequent visitor to the British Islands It is a bird of most irregular and erratic habits—a vast horde suddenly arriving at some place to which it may have hitherto been a stranger, and at once making a settlement there, leaving it wholly deserted as soon as the young are reared This happened in the summer of 1875 at Villafranca, in the province of Verona, the castle of which was occupied in a single day by some 12,000 or 14,000 birds of this species, as has been graphically told by Sig de Betta (*Atti del R Ist Veneto*, ser 5, vol ii),[1] but similar instances have been before recorded,—as in Bulgaria in 1867, near Smyrna in 1856, and near Odessa in 1844, to mention only some of which particulars have been published[2] (A N)

STARODUB, a district town of Russia, in the government of Tchernigoff, 116 miles to the north east of that town, on the marshy banks of a small tributary of the navigable Sudost It is regularly built, with broad straight streets, the houses being surrounded by large gardens Its 23,890 inhabitants—Little Russian descendants of former Cossacks, with about 5000 Jews—support themselves chiefly by gardening and agriculture Tanning is also carried on, and the trade in corn and hemp exported to Riga and St Petersburg has some importance

Starodub at one time played a prominent part in the history of the Ukraine As early as the 11th and 12th centuries it was a bone of contention between different Russian princes, who appreciated the value of its strategic position The Mongols seem to have destroyed it, and its name does not reappear till the 14th century During the 15th and 16th centuries the Russians and Lithuanians were continually disputing the possession of its fortress, and at the beginning of the 17th century it became a stronghold of Poland

STARO-KONSTANTINOFF, a district town of Russia, in the government of Volhynia, situated 121 miles to the west-south-west of Zhitomir It is an old-fashioned, poorly built town, dating from the 16th century, and is often mentioned in history in connexion with the rising of Cossacks under Bogdan Khmelnitzky Owing to its excellent position close to the Austrian frontier and its railway communication with south-west Russia, it has a very active trade in corn, cattle, and salt with Austria, Prussia, and Poland Its population (17,980 in 1884, of whom two-thirds were Jews) is rapidly increasing

STASSFURT, a town in the Prussian province of Saxony, and one of the chief seats of the German salt-producing industry, is situated on both sides of the Bode, 19 miles to the south-west of Magdeburg Although saline springs are mentioned here as early as the 13th century, the first attempt to bore for salt was not made until 1839, while the systematic exploitation of the salt-beds, to which the town is indebted for its prosperity, dates only from 1856 The shafts reached deposits of salt at a depth of 850 feet, but the finer and purer layers lie more than 1100 feet below the surface Besides the rock-salt, which is excavated by blasting, the saline deposits of Stassfurt yield a considerable quantity of deliquescent salts and other saline products, which have encouraged the foundation of numerous chemical factories in the town and in the neighbouring village of Leopoldshall, which stands upon Anhalt territory The formation of the Stassfurt salt-beds and the composition of the rock-salt are described under SALT (vol xxi pp 231, 232) The rock-salt works are mainly Government property, while the chemical factories are in private hands About 2000 workmen are employed in the Stassfurt salt industry, and about 490,000 tons of raw salt are annually excavated The population of the town, which contains one or two miscellaneous factories, was 16,457 in 1885

STATE, GREAT OFFICERS OF All the principal ministers of the British crown are popularly called the great officers of state Under this designation are more or less accurately included the premier for the time being, the other members of the cabinet, and the leading functionaries of the court But properly speaking the great offices of state are only nine in number, and it is to the holders of them alone that the description of "the great officers of state" strictly and distinctively applies They are the lord high steward, the lord high chancellor, the lord high treasurer, the lord-president of the privy council, the lord-keeper of the privy seal, the lord great chamberlain, the lord high constable, the earl marshal, and the lord high admiral Of these, three—the lord chancellor, the lord-president of the council, and the lord privy seal—are the first and second always and the third almost always cabinet ministers The offices of two more—those of the lord treasurer and the high constable—are now executed by commission, the chief of the lords commissioners, known severally as the first lord of the treasury and the first lord of the admiralty, being likewise members of the cabinet, while the first lord of the treasury is usually at the head of the Government But, although it has become the rule for the treasury and the admiralty to be put in commission, there is nothing except usage of longer or shorter duration to prevent the crown from making a personal appointment to either of them, and the functions which formerly appertained to the lord treasurer and the high admiral are still regularly performed in the established course of the national administration The four offices of the high steward, the great chamberlain, the high constable, and the earl marshal stand on a different footing, and can be regarded at the present day as little else than survivals from an earlier condition of society They have practically ceased to have any relation to the ordinary routine of business in the country or of ceremonial in the palace, and the duties associated with them have either passed entirely into abeyance or are restricted within extremely narrow limits, save on certain occasions of exceptional pomp and solemnity All of them were once hereditary, and, taking the three kingdoms together, they or their counterparts and equivalents continue to be held by right of inheritance in one or other of them even now The prince of Wales is the hereditary great steward of Scotland, and the earl of Shrewsbury is the hereditary grand seneschal of Ireland The great chamberlainship of England is held jointly by Lady Willoughby de Eresby and Lord Carrington on the one part and on the other part by the marquis of Cholmondeley The hereditary high constable of Scotland is the earl of Erroll, and the hereditary earl marshal of England is the duke of Norfolk It is of the great offices of the steward, the chamberlain, the constable, and the marshal that we shall at present speak, the rest of those we have mentioned being dealt with under their proper headings, or in the articles CABINET, MINISTRY, PRIVY COUNCIL, and ROYAL HOUSEHOLD

Lord high steward

The lord high steward of England ranks as the first of the great officers of state His office is called out of abeyance by commission under the great seal only for coronations and for trials by the House of Lords At the former he bears the crown of St Edward immediately before the sovereign in the procession to Westminster Abbey, and he presides at the latter on the arraignment of a peer or a peeress for treason or felony From the reign of Richard II to that of Henry VII it was the duty of the

[1] A partial translation of this paper is given in the *Zoologist* for 1878, pp 18–22
